- `B`, `BL`, and `BLX` (immediate). The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a sign-extended immediate offset that is added to the `PC` value of the instruction to form the target address of the branch.
- `CBNZ` and `CBZ`. The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a zero-extended immediate offset that is added to the `PC` value of the instruction to form the target address of the branch. They do not support backward branches.
- `LDC`, `LDC2`, `LDR`, `LDRB`, `LDRD`, `LDRH`, `LDRSB`, `LDRSH`, `PLD`, `PLDW`, `PLI`, and `VLDR`. The normal assembler syntax of these load instructions can specify the label of a literal data item that is to be loaded. The encodings of these instructions specify a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item. A few such encodings perform a fixed addition or a fixed subtraction and must only be used when that operation is required, but most contain a bit that specifies whether the offset is to be added or subtracted.

  When the assembler calculates an offset of 0 for the normal syntax of these instructions, it must assemble an encoding that adds 0 to the `Align(PC, 4)` value of the instruction. Encodings that subtract 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

  There is an alternative syntax for these instructions that specifies the addition or subtraction and the immediate offset explicitly. In this syntax, the label is replaced by `[PC, #+/-<imm>]`, where:

  `+/-` Is `+` or omitted to specify that the immediate offset is to be added to the `Align(PC, 4)` value, or `-` if it is to be subtracted.

  `<imm>` Is the immediate offset.

  This alternative syntax makes it possible to assemble the encodings that subtract 0 from the `Align(PC, 4)` value, and to disassemble them to a syntax that can be re-assembled correctly.
- `ADR`. The normal assembler syntax for this instruction can specify the label of an instruction or literal data item whose address is to be calculated. Its encoding specifies a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item, and some opcode bits that determine whether it is an addition or subtraction.

  When the assembler calculates an offset of 0 for the normal syntax of this instruction, it must assemble the encoding that adds 0 to the `Align(PC, 4)` value of the instruction. The encoding that subtracts 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

  There is an alternative syntax for this instruction that specifies the addition or subtraction and the immediate value explicitly, by writing them as additions `ADD <Rd>, PC, #<imm>` or subtractions `SUB <Rd>, PC, #<imm>`. This alternative syntax makes it possible to assemble the encoding that subtracts 0 from the `Align(PC, 4)` value, and to disassemble it to a syntax that can be re-assembled correctly.

Note

ARM recommends that where possible, software avoids using:

- The alternative syntax for the `ADR`, `LDC`, `LDC2`, `LDR`, `LDRB`, `LDRD`, `LDRH`, `LDRSB`, `LDRSH`, `PLD`, `PLI`, `PLDW`, and `VLDR` instructions.
- The encodings of these instructions that subtract 0 from the `Align(PC, 4)` value.

F1.3 Branch instructions

Table F1-1 summarizes the branch instructions in the T32 and A32 instruction sets. In addition to providing for changes in the flow of execution, some branch instructions can change instruction set.

Table F1-1 Branch instructions

Instruction	See	Range, T32	Range, A32
Branch to target address	*B* on page F5-2523	±16MB	±32MB
Compare and Branch on Nonzero, Compare and Branch on Zero	*CBNZ, CBZ* on page F5-2546	0-126 bytes	[a]
Call a subroutine Call a subroutine, change instruction set[b]	*BL, BLX (immediate)* on page F5-2539	±16MB ±16MB	±32MB ±32MB
Call a subroutine, optionally change instruction set	*BLX (register)* on page F5-2541	Any	Any
Branch to target address, change instruction set	*BX* on page F5-2543	Any	Any
Change to Jazelle state	*BXJ* on page F5-2545	-	-
Table Branch (byte offsets) Table Branch (halfword offsets)	*TBB, TBH* on page F5-3017	0-510 bytes 0-131070 bytes	[a]

a. These instructions do not exist in the A32 instruction set.

b. The range is determined by the instruction set of the `BLX` instruction, not of the instruction it branches to.

Branches to loaded and calculated addresses can be performed by `LDR`, `LDM` and data-processing instructions. For details see *Load/store instructions* on page F1-2297, *Load/store multiple instructions* on page F1-2300, *Standard data-processing instructions* on page F1-2288, and *Shift instructions* on page F1-2290.

In addition to the branch instructions shown in Table F1-1:

- In the A32 instruction set, a data-processing instruction that targets the PC behaves as a branch instruction. For more information, see *Data-processing instructions* on page F1-2288.
- In the T32 and A32 instruction sets, a load instruction that targets the PC behaves as a branch instruction. For more information, see *Load/store instructions* on page F1-2297.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F1.4 Data-processing instructions

Core data-processing instructions belong to one of the following groups:

- *Standard data-processing instructions*.

  These instructions perform basic data-processing operations, and share a common format with some variations.
- *Shift instructions* on page F1-2290.
- *Multiply instructions* on page F1-2290.
- *Saturating instructions* on page F1-2292.
- *Saturating addition and subtraction instructions* on page F1-2292.
- *Packing and unpacking instructions* on page F1-2293.
- *Parallel addition and subtraction instructions* on page F1-2294.
- *Divide instructions* on page F1-2295.
- *Miscellaneous data-processing instructions* on page F1-2295.

For related Advanced SIMD and floating-point instructions see *Advanced SIMD data-processing instructions* on page F1-2307 and *Floating-point data-processing instructions* on page F1-2315.

F1.4.1 Standard data-processing instructions

These instructions generally have a destination register Rd, a first operand register Rn, and a second operand. The second operand can be another register Rm, or an immediate constant.

If the second operand is an immediate constant, it can be:

- Encoded directly in the instruction.
- A *modified immediate constant* that uses 12 bits of the instruction to encode a range of constants. T32 and A32 instructions have slightly different ranges of modified immediate constants. For more information, see *Modified immediate constants in T32 instructions* on page F2-2336 and *Modified immediate constants in A32 instructions* on page F2-2337.

If the second operand is another register, it can optionally be shifted in any of the following ways:

`LSL` Logical Shift Left by 1-31 bits.

`LSR` Logical Shift Right by 1-32 bits.

`ASR` Arithmetic Shift Right by 1-32 bits.

`ROR` Rotate Right by 1-31 bits.

`RRX` Rotate Right with Extend. For details see *Shift and rotate operations* on page E1-2208.

In T32 code, the amount to shift by is always a constant encoded in the instruction. In A32 code, the amount to shift by is either a constant encoded in the instruction, or the value of a register, Rs.

For instructions other than `CMN`, `CMP`, `TEQ`, and `TST`, the result of the data-processing operation is placed in the destination register. In the A32 instruction set, the destination register can be the PC, causing the result to be treated as a branch address. In the T32 instruction set, this is only permitted for some 16-bit forms of the `ADD` and `MOV` instructions.

These instructions can optionally set the condition flags, according to the result of the operation. If they do not set the flags, existing flag settings from a previous instruction are preserved.

Table F1-2 on page F1-2289 summarizes the main data-processing instructions in the T32 and A32 instruction sets. Generally, each of these instructions is described in three sections in Chapter F2 *About the T32 and A32 Instruction Descriptions*, one section for each of the following:

- `INSTRUCTION` (immediate) where the second operand is a modified immediate constant.
- `INSTRUCTION` (register) where the second operand is a register, or a register shifted by a constant.
- `INSTRUCTION` (register-shifted register) where the second operand is a register shifted by a value obtained from another register. These are only available in the A32 instruction set.

Non-Confidential - Beta

Table F1-2 Standard data-processing instructions

Instruction	Mnemonic	Notes
Add with Carry	ADC	-
Add	ADD	T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
Form PC-relative Address	ADR	First operand is the PC. Second operand is an immediate constant. T32 instruction set uses a zero-extended 12-bit immediate constant. Operation is an addition or a subtraction.
Bitwise AND	AND	-
Bitwise Bit Clear	BIC	-
Compare Negative	CMN	Sets flags. Like ADD but with no destination register.
Compare	CMP	Sets flags. Like SUB but with no destination register.
Bitwise Exclusive OR	EOR	-
Copy operand to destination	MOV	Has only one operand, with the same options as the second operand in most of these instructions. If the operand is a shifted register, the instruction is an LSL, LSR, ASR, or ROR instruction instead. For details see *Shift instructions* on page F1-2290. The T32 and A32 instruction sets permit use of a modified immediate constant or a zero-extended 16-bit immediate constant.
Bitwise NOT	MVN	Has only one operand, with the same options as the second operand in most of these instructions.
Bitwise OR NOT	ORN	Not available in the A32 instruction set.
Bitwise OR	ORR	-
Reverse Subtract	RSB	Subtracts first operand from second operand. This permits subtraction from constants and shifted registers.
Reverse Subtract with Carry	RSC	Not available in the T32 instruction set.
Subtract with Carry	SBC	-
Subtract	SUB	T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
Test Equivalence	TEQ	Sets flags. Like EOR but with no destination register.
Test	TST	Sets flags. Like AND but with no destination register.

Non-Confidential - Beta

F1.4.2 Shift instructions

Table F1-3 lists the shift instructions in the T32 and A32 instruction sets.

Table F1-3 Shift instructions

Instruction	See
Arithmetic Shift Right	*ASR (immediate)* on page F5-2515 *ASR (register)* on page F5-2517 *ASRS (immediate)* on page F5-2519 *ASRS (register)* on page F5-2521
Logical Shift Left	*LSL (immediate)* on page F5-2687 *LSL (register)* on page F5-2689 *LSLS (immediate)* on page F5-2691 *LSLS (register)* on page F5-2693
Logical Shift Right	*LSR (immediate)* on page F5-2695 *LSR (register)* on page F5-2697 *LSRS (immediate)* on page F5-2699 *LSRS (register)* on page F5-2701
Rotate Right	*ROR (immediate)* on page F5-2817 *ROR (register)* on page F5-2819 *RORS (immediate)* on page F5-2821 *RORS (register)* on page F5-2823
Rotate Right with Extend	*RRX* on page F5-2825 *RRXS* on page F5-2827

In the A32 instruction set only, the destination register of these instructions can be the PC, causing the result to be treated as an address to branch to.

F1.4.3 Multiply instructions

These instructions can operate on signed or unsigned quantities. In some types of operation, the results are the same whether the operands are signed or unsigned.

- Table F1-4 summarizes the multiply instructions where there is no distinction between signed and unsigned quantities.

  The least significant 32 bits of the result are used. More significant bits are discarded.
- Table F1-5 on page F1-2291 summarizes the signed multiply instructions.
- Table F1-6 on page F1-2291 summarizes the unsigned multiply instructions.

Table F1-4 General multiply instructions

Instruction	See	Operation (number of bits)
Multiply Accumulate	*MLA, MLAS* on page F5-2708	32 = 32 + 32 × 32
Multiply and Subtract	*MLS* on page F5-2710	32 = 32 – 32 × 32
Multiply	*MUL, MULS* on page F5-2743	32 = 32 × 32

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Table F1-5 Signed multiply instructions

Instruction	See	Operation (number of bits)
Signed Multiply Accumulate (halfwords)	*SMLABB, SMLABT, SMLATB, SMLATT* on page F5-2881	32 = 32 + 16 × 16
Signed Multiply Accumulate Dual	*SMLAD, SMLADX* on page F5-2883	32 = 32 + 16 × 16 + 16 × 16
Signed Multiply Accumulate Long	*SMLAL, SMLALS* on page F5-2885	64 = 64 + 32 × 32
Signed Multiply Accumulate Long (halfwords)	*SMLALBB, SMLALBT, SMLALTB, SMLALTT* on page F5-2887	64 = 64 + 16 × 16
Signed Multiply Accumulate Long Dual	*SMLALD, SMLALDX* on page F5-2889	64 = 64 + 16 × 16 + 16 × 16
Signed Multiply Accumulate (word by halfword)	*SMLAWB, SMLAWT* on page F5-2891	32 = 32 + 32 × 16 [a]
Signed Multiply Subtract Dual	*SMLSD, SMLSDX* on page F5-2893	32 = 32 + 16 × 16 – 16 × 16
Signed Multiply Subtract Long Dual	*SMLSLD, SMLSLDX* on page F5-2895	64 = 64 + 16 × 16 – 16 × 16
Signed Most Significant Word Multiply Accumulate	*SMMLA, SMMLAR* on page F5-2897	32 = 32 + 32 × 32 [b]
Signed Most Significant Word Multiply Subtract	*SMMLS, SMMLSR* on page F5-2899	32 = 32 – 32 × 32 [b]
Signed Most Significant Word Multiply	*SMMUL, SMMULR* on page F5-2901	32 = 32 × 32 [b]
Signed Dual Multiply Add	*SMUAD, SMUADX* on page F5-2903	32 = 16 × 16 + 16 × 16
Signed Multiply (halfwords)	*SMULBB, SMULBT, SMULTB, SMULTT* on page F5-2905	32 = 16 × 16
Signed Multiply Long	*SMULL, SMULLS* on page F5-2907	64 = 32 × 32
Signed Multiply (word by halfword)	*SMULWB, SMULWT* on page F5-2909	32 = 32 × 16 [a]
Signed Dual Multiply Subtract	*SMUSD, SMUSDX* on page F5-2911	32 = 16 × 16 – 16 × 16

a. The most significant 32 bits of the 48-bit product are used. Less significant bits are discarded.
b. The most significant 32 bits of the 64-bit product are used. Less significant bits are discarded.

Table F1-6 Unsigned multiply instructions

Instruction	See	Operation (number of bits)
Unsigned Multiply Accumulate Accumulate Long	*UMAAL* on page F5-3052	64 = 32 + 32 + 32 × 32
Unsigned Multiply Accumulate Long	*UMLAL, UMLALS* on page F5-3054	64 = 64 + 32 × 32
Unsigned Multiply Long	*UMULL, UMULLS* on page F5-3056	64 = 32 × 32

Non-Confidential - Beta

F1.4.4 Saturating instructions

Table F1-7 lists the saturating instructions in the T32 and A32 instruction sets. For more information, see *Pseudocode description of saturation* on page E1-2209.

Table F1-7 Saturating instructions

Instruction	See	Operation
Signed Saturate	*SSAT* on page F5-2916	Saturates optionally shifted 32-bit value to selected range
Signed Saturate 16	*SSAT16* on page F5-2918	Saturates two 16-bit values to selected range
Unsigned Saturate	*USAT* on page F5-3074	Saturates optionally shifted 32-bit value to selected range
Unsigned Saturate 16	*USAT16* on page F5-3076	Saturates two 16-bit values to selected range

F1.4.5 Saturating addition and subtraction instructions

Table F1-8 lists the saturating addition and subtraction instructions in the T32 and A32 instruction sets. For more information, see *Pseudocode description of saturation* on page E1-2209.

Table F1-8 Saturating addition and subtraction instructions

Instruction	See	Operation
Saturating Add	*QADD* on page F5-2788	Add, saturating result to the 32-bit signed integer range
Saturating Subtract	*QSUB* on page F5-2801	Subtract, saturating result to the 32-bit signed integer range
Saturating Double and Add	*QADD* on page F5-2788	Doubles one value and adds a second value, saturating the doubling and the addition to the 32-bit signed integer range
Saturating Double and Subtract	*QDSUB* on page F5-2797	Doubles one value and subtracts the result from a second value, saturating the doubling and the subtraction to the 32-bit signed integer range

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F1.4.6 Packing and unpacking instructions

Table F1-9 lists the packing and unpacking instructions in the T32 and A32 instruction sets.

Table F1-9 Packing and unpacking instructions

Instruction	See	Operation
Pack Halfword	*PKHBT, PKHTB* on page F5-2765	Combine halfwords
Signed Extend and Add Byte	*SXTAB* on page F5-3005	Extend 8 bits to 32 and add
Signed Extend and Add Byte 16	*SXTAB16* on page F5-3007	Dual extend 8 bits to 16 and add
Signed Extend and Add Halfword	*SXTAH* on page F5-3009	Extend 16 bits to 32 and add
Signed Extend Byte	*SXTB* on page F5-3011	Extend 8 bits to 32
Signed Extend Byte 16	*SXTB16* on page F5-3013	Dual extend 8 bits to 16
Signed Extend Halfword	*SXTH* on page F5-3015	Extend 16 bits to 32
Unsigned Extend and Add Byte	*UXTAB* on page F5-3084	Extend 8 bits to 32 and add
Unsigned Extend and Add Byte 16	*UXTAB16* on page F5-3086	Dual extend 8 bits to 16 and add
Unsigned Extend and Add Halfword	*UXTAH* on page F5-3088	Extend 16 bits to 32 and add
Unsigned Extend Byte	*UXTB* on page F5-3090	Extend 8 bits to 32
Unsigned Extend Byte 16	*UXTB16* on page F5-3092	Dual extend 8 bits to 16
Unsigned Extend Halfword	*UXTH* on page F5-3094	Extend 16 bits to 32

F1.4.7 Parallel addition and subtraction instructions

These instructions perform additions and subtractions on the values of two registers and write the result to a destination register, treating the register values as sets of two halfwords or four bytes. That is, they perform SIMD additions or subtractions on the general-purpose registers.

These instructions consist of a prefix followed by a main instruction mnemonic. The prefixes are as follows:

`S` Signed arithmetic modulo 2^8 or 2^{16}.

`Q` Signed saturating arithmetic.

`SH` Signed arithmetic, halving the results.

`U` Unsigned arithmetic modulo 2^8 or 2^{16}.

`UQ` Unsigned saturating arithmetic.

`UH` Unsigned arithmetic, halving the results.

The main instruction mnemonics are as follows:

`ADD16` Adds the top halfwords of two operands to form the top halfword of the result, and the bottom halfwords of the same two operands to form the bottom halfword of the result.

`ASX` Exchanges halfwords of the second operand, and then adds top halfwords and subtracts bottom halfwords.

`SAX` Exchanges halfwords of the second operand, and then subtracts top halfwords and adds bottom halfwords.

`SUB16` Subtracts each halfword of the second operand from the corresponding halfword of the first operand to form the corresponding halfword of the result.

`ADD8` Adds each byte of the second operand to the corresponding byte of the first operand to form the corresponding byte of the result.

`SUB8` Subtracts each byte of the second operand from the corresponding byte of the first operand to form the corresponding byte of the result.

The instruction set permits all 36 combinations of prefix and main instruction operand, as Table F1-10 shows.

See also *Advanced SIMD parallel addition and subtraction* on page F1-2308.

Table F1-10 Parallel addition and subtraction instructions

Main instruction	Signed	Saturating	Signed halving	Unsigned	Unsigned saturating	Unsigned halving
`ADD16`, add, two halfwords	`SADD16`	`QADD16`	`SHADD16`	`UADD16`	`UQADD16`	`UHADD16`
`ASX`, add and subtract with exchange	`SASX`	`QASX`	`SHASX`	`UASX`	`UQASX`	`UHASX`
`SAX`, subtract and add with exchange	`SSAX`	`QSAX`	`SHSAX`	`USAX`	`UQSAX`	`UHSAX`
`SUB16`, subtract, two halfwords	`SSUB16`	`QSUB16`	`SHSUB16`	`USUB16`	`UQSUB16`	`UHSUB16`
`ADD8`, add, four bytes	`SADD8`	`QADD8`	`SHADD8`	`UADD8`	`UQADD8`	`UHADD8`
`SUB8`, subtract, four bytes	`SSUB8`	`QSUB8`	`SHSUB8`	`USUB8`	`UQSUB8`	`UHSUB8`

F1.4.8 Divide instructions

In ARMv8, signed and unsigned integer divide instructions are included in both the T32 instruction set and the A32 instruction set. For more information about their implementation in previous versions of the ARM architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

For descriptions of the instructions see:

- *SDIV* on page F5-2858.
- *UDIV* on page F5-3038.

For the `SDIV` and `UDIV` instructions, divide-by-zero always returns a zero result.

The ID_ISAR0.Divide_instrs field indicates the level of support for these instructions. The field value of `0b0010` indicates they are implemented in both the T32 and A32 instruction sets.

F1.4.9 Miscellaneous data-processing instructions

Table F1-11 lists the miscellaneous data-processing instructions in the T32 and A32 instruction sets. Immediate values in these instructions are simple binary numbers.

Table F1-11 Miscellaneous data-processing instructions

Instruction	See	Notes
BitField Clear	*BFC* on page F5-2526	-
BitField Insert	*BFI* on page F5-2528	-
Count Leading Zeros	*CLZ* on page F5-2550	-
Move Top	*MOVT* on page F5-2724	Moves 16-bit immediate value to top halfword. Bottom halfword unchanged.
Reverse Bits	*RBIT* on page F5-2807	-

F1.5 PSTATE and banked register access instructions

These instructions transfer PE state information to or from a general-purpose register.

F1.5.1 PSTATE access instructions

PSTATE holds process state information, see *Process state, PSTATE* on page E1-2211. In AArch32 state:

- At EL1 or higher, PSTATE is accessible using the *Current Program Status Register* (CPSR).
- At EL0, a subset of the CPSR is accessible as the *Application Program Status Register* (APSR).
- On taking an exception, the contents of the CPSR are copied to the *Saved Program Status Register* (SPSR) of the mode from which the exception is taken.

The `MRS` and `MSR` instructions move the contents of the CPSR, APSR, or the SPSR of the current mode to or from a general-purpose register, see:

- *MRS* on page F5-2731.
- *MSR (immediate)* on page F5-2739.
- *MSR (register)* on page F5-2741.

When executed at EL0, `MRS` and `MSR` instructions can only access the APSR.

The PSTATE condition flags, PSTATE.{N, Z, C, V} are set by the execution of data-processing instructions, and can control the execution of conditional instructions. However, software can set the condition flags explicitly using the `MSR` instruction, and can read the current state of the condition flags explicitly using the `MRS` instruction.

In addition, at EL1 or higher, software can use the `CPS` instruction to change the PSTATE.M field and the PSTATE.{A, I, F} interrupt mask bits, see *CPS, CPSID, CPSIE* on page F5-2562.

F1.5.2 Banked register access instructions

At EL1 or higher, the `MRS` (Banked register) and `MSR` (Banked register) instructions move the contents of a Banked general-purpose register, the SPSR, or the ELR_hyp, to or from a general-purpose register. See:

- *MRS (Banked register)* on page F5-2733.
- *MSR (Banked register)* on page F5-2736.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F1.6 Load/store instructions

Table F1-12 summarizes the general-purpose register load/store instructions in the T32 and A32 instruction sets. Some of these instructions can also operate on the PC. See also:

- *Load/store multiple instructions* on page F1-2300.
- *Synchronization and semaphores* on page E2-2271, for more information about the Load-Exclusive and Store-Exclusive instructions.
- *Load-Acquire, Store-Release* on page E2-2254, for more information about the Load-Acquire/Store-Release and Load-Acquire Exclusive/Store-Release Exclusive instructions.
- *Advanced SIMD and floating-point load/store instructions* on page F1-2304.

Load/store instructions have several options for addressing memory. For more information, see *Addressing modes* on page F1-2298.

Table F1-12 Load/store instructions

Data type	Load	Store	Unprivileged		Exclusive		Load-Acquire	Store-Release	Exclusive	
			Load	Store	Load	Store			Load-Acquire	Store-Release
32-bit word	LDR	STR	LDRT	STRT	LDREX	STREX	LDA	STL	LDAEX	STLEX
16-bit halfword	-	STRH	-	STRHT	-	STREXH	LDAH	STLH	LDAEXH	STLEXH
16-bit unsigned halfword	LDRH	-	LDRHT	-	LDREXH	-	-	-	-	-
16-bit signed halfword	LDRSH	-	LDRSHT	-	-	-	-	-	-	-
8-bit byte	-	STRB	-	STRBT	-	STREXB	LDAB	STLB	LDAEXB	STLEXB
8-bit unsigned byte	LDRB	-	LDRBT	-	LDREXB	-	-	-	-	-
8-bit signed byte	LDRSB	-	LDRSBT	-	-	-	-	-	-	-
Two 32-bit words	LDRD	STRD	-	-	-	-	-	-	-	-
64-bit doubleword	-	-	-	-	LDREXD	STREXD	-	-	LDAEXD	STLEXD

F1.6.1 Loads to the PC

The LDR instruction can load a value into the PC. The value loaded is treated as an interworking address, as described by the LoadWritePC() pseudocode function in *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

F1.6.2 Halfword and byte loads and stores

Halfword and byte stores store the least significant halfword or byte from the register, to 16 or 8 bits of memory respectively. There is no distinction between signed and unsigned stores.

Halfword and byte loads load 16 or 8 bits from memory into the least significant halfword or byte of a register. Unsigned loads zero-extend the loaded value to 32 bits, and signed loads sign-extend the value to 32 bits.

Non-Confidential - Beta

F1.6.3 Load unprivileged and Store unprivileged

When executing at EL0, a Load unprivileged or Store unprivileged instruction operates in exactly the same way as the corresponding ordinary load or store instruction. For example, an `LDRT` instruction executes in exactly the same way as the equivalent `LDR` instruction. When executed at PL1, Load unprivileged and Store unprivileged instructions behave as they would if they were executed at EL0. For example, an `LDRT` instruction executes in exactly the way that the equivalent `LDR` instruction would execute at EL0. In particular, the instructions make unprivileged memory accesses.

Note

As described in *Execution privilege, Exception levels, and AArch32 Privilege levels* on page G4-3874, execution at PL1 describes all of the following:

- Execution at Non-secure EL1 using AArch32.
- Execution at Secure EL1 using AArch32 when EL3 is not implemented.
- Execution at Secure EL1 using AArch32 when EL3 is implemented and is using AArch64.
- Execution at Secure EL3 when EL3 is implemented and is using AArch32.

The Load unprivileged and Store unprivileged instructions are CONSTRAINED UNPREDICTABLE if executed at EL2, see *Execution of Load/Store unprivileged instructions in Hyp mode* on page K1-5364.

For more information about execution privilege, see *Access permissions* on page G4-3921.

F1.6.4 Load-Exclusive and Store-Exclusive

Load-Exclusive and Store-Exclusive instructions provide shared memory synchronization. For more information, see *Synchronization and semaphores* on page E2-2271.

F1.6.5 Load-Acquire and Store-Release

Load-Acquire and Store-Release instructions provide memory barriers. Load-Acquire Exclusive and Store-Release Exclusive instructions provide memory barriers with shared memory synchronization. For more information, see *Load-Acquire, Store-Release* on page E2-2254.

F1.6.6 Addressing modes

The address for a load or store is formed from two parts: a value from a base register, and an offset.

The base register can be any one of the general-purpose registers R0-R12, SP, or LR.

For loads, the base register can be the PC. This provides PC-relative addressing for position-independent code. Instructions marked (literal) in their title in Chapter F2 *About the T32 and A32 Instruction Descriptions* are PC-relative loads.

The offset takes one of three formats:

Immediate The offset is an unsigned number that can be added to or subtracted from the base register value. Immediate offset addressing is useful for accessing data elements that are a fixed distance from the start of the data object, such as structure fields, stack offsets and input/output registers.

Register The offset is a value from a general-purpose register. The value can be added to, or subtracted from, the base register value. Register offsets are useful for accessing arrays or blocks of data.

Scaled register The offset is a general-purpose register, shifted by an immediate value, then added to or subtracted from the base register. This means an array index can be scaled by the size of each array element.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The offset and base register can be used in three different ways to form the memory address. The addressing modes are described as follows:

Offset The offset is added to or subtracted from the base register to form the memory address.

Pre-indexed The offset is added to or subtracted from the base register to form the memory address. The base register is then updated with this new address, to permit automatic indexing through an array or memory block.

Post-indexed The value of the base register alone is used as the memory address. The offset is then added to or subtracted from the base register. The result is stored back in the base register, to permit automatic indexing through an array or memory block.

Note

Not every variant is available for every instruction, and the range of permitted immediate values and the options for scaled registers vary from instruction to instruction. See Chapter F2 *About the T32 and A32 Instruction Descriptions* for full details for each instruction.

Non-Confidential - Beta

F1.7 Load/store multiple instructions

Load Multiple instructions load from memory a subset, or possibly all, of the general-purpose registers and the PC.

Store Multiple instructions store to memory a subset, or possibly all, of the general-purpose registers.

The memory locations are consecutive word-aligned words. The addresses used are obtained from a base register, and can be either above or below the value in the base register. The base register can optionally be updated by the total size of the data transferred.

Table F1-13 summarizes the load/store multiple instructions in the T32 and A32 instruction sets.

Table F1-13 Load/store multiple instructions

Instruction	See
Load Multiple, Increment After or Full Descending	*LDM, LDMIA, LDMFD* on page F5-2613
Load Multiple, Decrement After or Full Ascending [a]	*LDMDA, LDMFA* on page F5-2620
Load Multiple, Decrement Before or Empty Ascending	*LDMDB, LDMEA* on page F5-2622
Load Multiple, Increment Before or Empty Descending [a]	*LDMIB, LDMED* on page F5-2624
Pop multiple registers off the stack [b]	*POP* on page F5-2778
Push multiple registers onto the stack [c]	*PUSH* on page F5-2784
Store Multiple, Increment After or Empty Ascending	*STM, STMIA, STMEA* on page F5-2941
Store Multiple, Decrement After or Empty Descending [a]	*STMDA, STMED* on page F5-2945
Store Multiple, Decrement Before or Full Descending	*STMDB, STMFD* on page F5-2947
Store Multiple, Increment Before or Full Ascending [a]	*STMIB, STMFA* on page F5-2949

a. Not available in the T32 instruction set.
b. This instruction is equivalent to an `LDM` instruction with the SP as base register, and base register updating.
c. This instruction is equivalent to an `STMDB` instruction with the SP as base register, and base register updating.

When executing at EL1, variants of the `LDM` and `STM` instructions load and store User mode registers. Another system level variant of the `LDM` instruction performs an exception return.

F1.7.1 Loads to the PC

The `LDM`, `LDMDA`, `LDMDB`, `LDMIB`, and `POP` instructions can load a value into the PC. The value loaded is treated as an interworking address, as described by the `LoadWritePC()` pseudocode function in *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

F1.8 Miscellaneous instructions

Table F1-14 summarizes the miscellaneous instructions in the T32 and A32 instruction sets.

Table F1-14 Miscellaneous instructions

Instruction	See
Clear-Exclusive	*CLREX* on page F5-2549
Debug Hint	*DBG* on page F5-2569
Data Memory Barrier	*DMB* on page F5-2571
Data Synchronization Barrier	*DSB* on page F5-2574
Instruction Synchronization Barrier	*ISB* on page F5-2590
If-Then	*IT* on page F5-2592
No Operation	*NOP* on page F5-2752
Preload Data	*PLD, PLDW (immediate)* on page F5-2767 *PLD (literal)* on page F5-2769 *PLD, PLDW (register)* on page F5-2771
Preload Instruction	*PLI (immediate, literal)* on page F5-2773 *PLI (register)* on page F5-2776
Set Endianness	*SETEND* on page F5-2862
Send Event	*SEV* on page F5-2863
Send Event Local	*SEVL* on page F5-2865
Wait For Event	*WFE* on page F5-3096
Wait For Interrupt	*WFI* on page F5-3098
Yield	*YIELD* on page F5-3100

F1.8.1 The Yield instruction

In a *Symmetric Multithreading* (SMT) design, a thread can use the `YIELD` instruction to give a hint to the PE that it is running on. The `YIELD` hint indicates that whatever the thread is currently doing is of low importance, and so could yield. For example, the thread might be sitting in a spin-lock. A similar use might be in modifying the arbitration priority of the snoop bus in a multiprocessor (MP) system. Defining such an instruction permits binary compatibility between SMT and SMP systems.

AArch32 state defines a `YIELD` instruction as a specific NOP (No Operation) hint instruction.

The `YIELD` instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use on migration to a multiprocessor or multithreading system. Operating systems can use `YIELD` in places where a yield hint is wanted, knowing that it will be treated as a `NOP` if there is no implementation benefit.

F1.9 Exception-generating and exception-handling instructions

The following instructions are intended specifically to cause a synchronous exception to occur:

- The SVC instruction generates a Supervisor Call exception. For more information, see *Supervisor Call (SVC) exception* on page G1-3711.
- The Breakpoint instruction BKPT provides software breakpoints. For more information, see *Software Breakpoint Instruction exceptions* on page G2-3791.
- In an implementation that includes EL3, when executing at EL1 or higher, the SMC instruction generates a Secure Monitor Call exception. For more information, see *Secure Monitor Call (SMC) exception* on page G1-3712.
- In an implementation that includes EL2, in software executing in a Non-secure EL1 mode, the HVC instruction generates a Hypervisor Call exception. For more information, see *Hypervisor Call (HVC) exception* on page G1-3713.

For an exception taken to an EL1 mode:

- The system level variants of the SUBS and LDM instructions can perform a return from an exception.

  Note

  The variants of SUBS include MOVS. See the references to *Subtract (exception return)*, *Move (exception return)*, and *Load Multiple (exception return)* in Table F1-15 for more information.

- The SRS instruction can be used near the start of the handler, to store return information. The RFE instruction can then perform a return from the exception using the stored return information.

In an implementation that includes EL2, the ERET instruction performs a return from an exception taken to Hyp mode.

For more information, see *Exception return to an Exception level using AArch32* on page G1-3692.

Table F1-15 summarizes the instructions, in the T32 and A32 instruction sets, for generating or handling an exception. Except for BKPT and SVC, these are system level instructions.

Table F1-15 Exception-generating and exception-handling instructions

Instruction	See
Supervisor Call	*SVC* on page F5-3003
Breakpoint	*BKPT* on page F5-2537
Secure Monitor Call	*SMC* on page F5-2879
Return From Exception	*RFE, RFEDA, RFEDB, RFEIA, RFEIB* on page F5-2815
Subtract (exception return)[a]	*SUB, SUBS (immediate)* on page F5-2988[a]
Move (exception return)[a]	*MOV, MOVS (register)* on page F5-2715[a]
Hypervisor Call	*HVC* on page F5-2588
Exception Return	*ERET* on page F5-2585
Load Multiple (exception return)	*LDM (exception return)* on page F5-2616
Store Return State	*SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F5-2913

a. The A32 instruction set includes other instruction forms that can be used for an exception return, that have previously been described as variants of SUBS PC, LR. ARM deprecates any use of these instruction forms.

F1.10 Coprocessor instructions

There are three types of instruction for communicating with conceptual coprocessors. These permit the PE to:

- Initiate a coprocessor data-processing operation. For details see *CDP, CDP2* on page F5-2547.
- Transfer general-purpose registers to and from coprocessor registers. For details, see:
  - *MCR, MCR2* on page F5-2703.
  - *MCRR, MCRR2* on page F5-2705.
  - *MRC, MRC2* on page F5-2726.
  - *MRRC, MRRC2* on page F5-2729.
- Load or store the values of coprocessor registers. For details, see:
  - *LDC, LDC2 (immediate)* on page F5-2606.
  - *LDC, LDC2 (literal)* on page F5-2610.
  - *STC, STC2* on page F5-2926.

The instruction set encodings provide supports up to 16 coprocessors, CP0 to CP15, with a 4-bit field in each coprocessor instruction to identify the coprocessor number. In ARMv8 the only supported coprocessors are CP10, CP11, CP14, and CP15, and these are supported only in AArch32 state.

Note

Multiple coprocessors can be used together to provide a larger block of coprocessor instructions. CP10 and CP11 are used in this way.

CP10 and CP11 are used, together, for floating-point and some Advanced SIMD functionality. There are different instructions for accessing these coprocessors, of similar types to the instructions for CP14 and CP15, that is, to:

- Initiate a coprocessor data-processing operation, see *Floating-point data-processing instructions* on page F1-2315.
- Transfer general-purpose registers to and from coprocessor registers, see *Advanced SIMD and floating-point register transfer instructions* on page F1-2306.
- Load or store the values of coprocessor registers, see *Advanced SIMD and floating-point load/store instructions* on page F1-2304.

Coprocessor instructions are part of the instruction stream executed by the PE. Any coprocessor instruction that cannot be executed by the implemented conceptual coprocessors causes an Undefined Instruction exception. This means that, in ARMv8 AArch32 state, all coprocessor access instruction encodings for coprocessors other than CP10, CP11, CP14, and CP15 are unallocated.

F1.11 Advanced SIMD and floating-point load/store instructions

Table F1-16 summarizes the SIMD and floating-point register file load/store instructions in the Advanced SIMD and floating-point instruction sets.

Advanced SIMD also provides instructions for loading and storing multiple elements, or structures of elements, see *Element and structure load/store instructions*.

Table F1-16 SIMD and floating-point register file load/store instructions

Instruction	See	Operation
Vector Load Multiple	*VLDM, VLDMDB, VLDMIA* on page F6-3326	Load 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point. Load 1-16 consecutive 32-bit registers, floating-point only.
Vector Load Register	*VLDR* on page F6-3329	Load one 64-bit register, Advanced SIMD and floating-point. Load one 32-bit register, floating-point only.
Vector Store Multiple	*VSTM, VSTMDB, VSTMIA* on page F6-3607	Store 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point. Store 1-16 consecutive 32-bit registers, floating-point only.
Vector Store Register	*VSTR* on page F6-3610	Store one 64-bit register, Advanced SIMD and floating-point. Store one 32-bit register, floating-point only.

F1.11.1 Element and structure load/store instructions

Table F1-17 shows the element and structure load/store instructions available in the Advanced SIMD instruction set. Loading and storing structures of more than one element automatically de-interleaves or interleaves the elements, see Figure F1-1 on page F1-2305 for an example of de-interleaving. Interleaving is the inverse process.

Table F1-17 Element and structure load/store instructions

Instruction	See
Load single element	
Multiple elements	*VLD1 (multiple single elements)* on page F6-3296
To one lane	*VLD1 (single element to one lane)* on page F6-3290
To all lanes	*VLD1 (single element to all lanes)* on page F6-3293
Load 2-element structure	
Multiple structures	*VLD2 (multiple 2-element structures)* on page F6-3305
To one lane	*VLD2 (single 2-element structure to one lane)* on page F6-3299
To all lanes	*VLD2 (single 2-element structure to all lanes)* on page F6-3302
Load 3-element structure	
Multiple structures	*VLD3 (multiple 3-element structures)* on page F6-3314
To one lane	*VLD3 (single 3-element structure to one lane)* on page F6-3308
To all lanes	*VLD3 (single 3-element structure to all lanes)* on page F6-3311

Table F1-17 Element and structure load/store instructions (continued)

Instruction	See
Load 4-element structure	
Multiple structures	*VLD4 (multiple 4-element structures)* on page F6-3323
To one lane	*VLD4 (single 4-element structure to one lane)* on page F6-3317
To all lanes	*VLD4 (single 4-element structure to all lanes)* on page F6-3320
Store single element	
Multiple elements	*VST1 (multiple single elements)* on page F6-3586
From one lane	*VST1 (single element from one lane)* on page F6-3583
Store 2-element structure	
Multiple structures	*VST2 (multiple 2-element structures)* on page F6-3592
From one lane	*VST2 (single 2-element structure from one lane)* on page F6-3589
Store 3-element structure	
Multiple structures	*VST3 (multiple 3-element structures)* on page F6-3598
From one lane	*VST3 (single 3-element structure from one lane)* on page F6-3595
Store 4-element structure	
Multiple structures	*VST4 (multiple 4-element structures)* on page F6-3604
From one lane	*VST4 (single 4-element structure from one lane)* on page F6-3601

Figure F1-1 shows the de-interleaving of a `VLD3.16` (multiple 3-element structures) instruction:

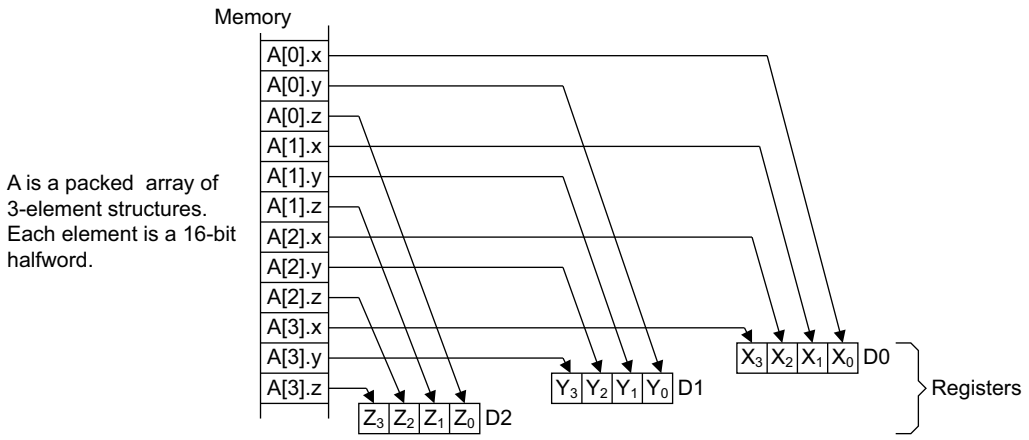

Figure F1-1 De-interleaving an array of 3-element structures

Figure F1-1 shows the `VLD3.16` instruction operating to three 64-bit registers that comprise four 16-bit elements:

- Different instructions in this group would produce similar figures, but operate on different numbers of registers. For example, `VLD4` and `VST4` instructions operate on four registers.
- Different element sizes would produce similar figures but with 8-bit or 32-bit elements.
- These instructions operate only on doubleword (64-bit) registers.

Non-Confidential - Beta

F1.12 Advanced SIMD and floating-point register transfer instructions

Table F1-18 summarizes the SIMD and floating-point register file transfer instructions in the Advanced SIMD and floating-point instruction sets. These instructions transfer data between the general-purpose registers and the registers in the SIMD and floating-point register file.

Advanced SIMD vectors, and single-precision and double-precision floating-point registers, are all views of the same register file. For details see *The SIMD and floating-point register file* on page E1-2217.

Table F1-18 SIMD and floating-point register file transfer instructions

Instruction	See
Copy element from general-purpose register to every element of an Advanced SIMD vector	*VDUP (general-purpose register)* on page F6-3266
Copy byte, halfword, or word from general-purpose register to a register in the SIMD and floating-point register file	*VMOV (general-purpose register to scalar)* on page F6-3379
Copy byte, halfword, or word from a register in the SIMD and floating-point register file to a general-purpose register	*VMOV (scalar to general-purpose register)* on page F6-3383
Copy from single-precision floating-point register to general-purpose register, or from general-purpose register to single-precision floating-point register	*VMOV (between general-purpose register and single-precision register)* on page F6-3381
Copy two words from general-purpose registers to consecutive single-precision floating-point registers, or from consecutive single-precision floating-point registers to general-purpose registers	*VMOV (between two general-purpose registers and two single-precision registers)* on page F6-3385
Copy two words from general-purpose registers to a doubleword register in the SIMD and floating-point register file, or from a doubleword register in the SIMD and floating-point register file to general-purpose registers	*VMOV (between two general-purpose registers and a doubleword floating-point register)* on page F6-3370

F1.13 Advanced SIMD data-processing instructions

Advanced SIMD data-processing instructions process registers containing vectors of elements of the same type packed together, enabling the same operation to be performed on multiple items in parallel.

Instructions operate on vectors held in 64-bit or 128-bit registers. Figure F1-2 shows an operation on two 64-bit operand vectors, generating a 64-bit vector result.

Note

Figure F1-2 and other similar figures show 64-bit vectors that consist of four 16-bit elements, and 128-bit vectors that consist of four 32-bit elements. Other element sizes produce similar figures, but with one, two, eight, or sixteen operations performed in parallel instead of four.

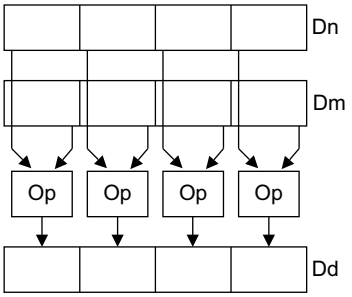

Figure F1-2 Advanced SIMD instruction operating on 64-bit registers

Many Advanced SIMD instructions have variants that produce vectors of elements double the size of the inputs. In this case, the number of elements in the result vector is the same as the number of elements in the operand vectors, but each element, and the whole vector, is double the size.

Figure F1-3 shows an example of an Advanced SIMD instruction operating on 64-bit registers, and generating a 128-bit result.

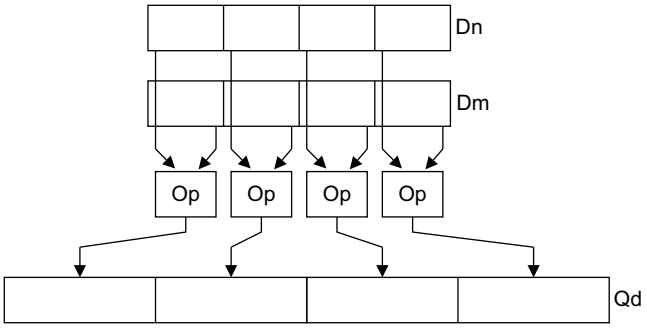

Figure F1-3 Advanced SIMD instruction producing wider result

There are also Advanced SIMD instructions that have variants that produce vectors containing elements half the size of the inputs. Figure F1-4 on page F1-2308 shows an example of an Advanced SIMD instruction operating on one 128-bit register, and generating a 64-bit result.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

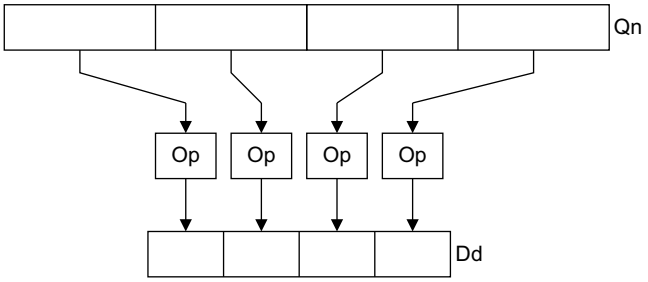

Figure F1-4 Advanced SIMD instruction producing narrower result

Some Advanced SIMD instructions do not conform to these standard patterns. Their operation patterns are described in the individual instruction descriptions.

Advanced SIMD instructions that perform floating-point arithmetic use the ARM standard floating-point arithmetic defined in *Floating-point and Advanced SIMD support* on page A1-46.

F1.13.1 Advanced SIMD parallel addition and subtraction

Table F1-19 shows the Advanced SIMD parallel add and subtract instructions.

Vector Saturating Rounding Doubling Multiply Returning High Half	*VQRDMULH* on page F6-3470
Vector Saturating Doubling Multiply Long	*VQDMULL* on page F6-3462

Advanced SIMD multiply instructions can operate on vectors of:

- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit polynomials over {0, 1}. `VMUL` and `VMULL` are the only instructions that operate on polynomials. `VMULL` produces a 16-bit polynomial over {0, 1}.
- Single-precision (32-bit) floating-point numbers.

They can also act on one vector and one scalar.

Long instructions have doubleword (64-bit) operands, and produce quadword (128-bit) results. Other Advanced SIMD multiply instructions can have either doubleword or quadword operands, and produce results of the same size.

Floating-point multiply instructions can operate on:

- Single-precision (32-bit) floating-point numbers.
- Double-precision (64-bit) floating-point numbers.

Chapter F2
About the T32 and A32 Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Format of instruction descriptions* on page F2-2318.
- *Standard assembler syntax fields* on page F2-2322.
- *Conditional execution* on page F2-2323.
- *Shifts applied to a register* on page F2-2325.
- *Memory accesses* on page F2-2327.
- *Encoding of lists of general-purpose registers and the PC* on page F2-2328.
- *About the T32 and A32 instruction encodings* on page F2-2329.
- *Additional pseudocode support for instruction descriptions* on page F2-2340.
- *Additional information about Advanced SIMD and floating-point instructions* on page F2-2341.

Non-Confidential - Beta

F2.1 Format of instruction descriptions

The instruction descriptions in Chapter F5 *T32 and A32 Base Instruction Set Instruction Descriptions* and Chapter F6 *T32 and A32 Advanced SIMD and floating-point Instruction Descriptions* normally use the following format:

- Instruction section title.
- Introduction to the instruction.
- A description of each encoding of the instruction.
- Assembler syntax.
- Pseudocode describing how the instruction operates.
- Notes, if applicable.

Each of these items is described in more detail in the following subsections.

F2.1.1 Instruction section title

The instruction section title gives the base mnemonic for the instruction or instructions described in the section. When one mnemonic has multiple forms described in separate instruction sections, this is followed by a short description of the form in parentheses. The most common use of this is to distinguish between forms of an instruction in which one of the operands is an immediate value and forms in which it is a register.

F2.1.2 Introduction to the instruction

The introduction to the instruction briefly describes the main features of the instruction. This description is not necessarily complete and is not definitive. If there is any conflict between it and the more detailed information that follows, the latter takes priority.

F2.1.3 Instruction encodings

This is a list of one or more instruction encodings. Each instruction encoding is labelled as:

- A1, A2, A3 … for the first, second, third and any additional A32 encodings.
- T1, T2, T3 … for the first, second, third and any additional T32 encodings.

Each instruction encoding description consists of:

- An assembly syntax that ensures that the assembler selects the encoding in preference to any other encoding. In some cases, multiple syntax variants are given. These are written in a `typewriter` font using the conventions described in *Assembler syntax prototype line conventions* on page F2-2320. The correct one to use can be indicated by:
  - A subheading that identifies the encodings that correspond to the syntax. See, for example, the subheading *Flag setting, rotate right with extend variant* in the description of the A1 encoding of the `ADC, ADCS` (register) instructions in *A1* on page F5-2479.
  - An annotation to the syntax, such as *Inside IT block* or *Outside IT block*. See, for example, the syntax descriptions of the T1 encoding of the `ADC, ADCS` (register) instructions in *T1* on page F5-2480.

  In other cases, the correct one to use can be determined by looking at the assembler syntax description and using it to determine which syntax corresponds to the instruction being disassembled.

  There is usually more than one syntax variant that ensures re-assembly to any particular encoding, and the exact set of syntaxes that do so usually depends on the register numbers, immediate constants and other operands to the instruction. For example, when assembling to the T32 instruction set, the syntax `AND R0, R0, R8` ensures selection of a 32-bit encoding but `AND R0, R0, R1` selects a 16-bit encoding.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For each instruction encoding belonging to a target instruction set, an assembler can use this information to determine whether it can use that encoding to encode the instruction requested by the UAL source. If multiple encodings can encode the instruction then:

— If both a 16-bit encoding and a 32-bit encoding can encode the instruction, the architecture *prefers* the 16-bit encoding. This means the assembler must use the 16-bit encoding rather than the 32-bit encoding.

  Software can use the `.W` and `.N` qualifiers to specify the required encoding width, see *Standard assembler syntax fields* on page F2-2322.

— If multiple encodings of the same length can encode the instruction, the *Assembler syntax* subsection says which encoding is preferred, and how software can, instead, select the other encodings.

  Each encoding also documents UAL syntax that selects it in preference to any other encoding.

If no encodings of the target instruction set can encode the instruction requested by the UAL source, normally the assembler generates an error saying that the instruction is not available in that instruction set.

Note

In some cases, an instruction is available in one instruction set but not in another. The *Assembler syntax* subsection identifies many of these cases. For example, the A32 instructions with bits<31:28> == `0b1111` described in *Branch, branch with link, and block data transfer* on page F4-2443, *Coprocessor instructions, and Supervisor Call* on page F4-2445, and *Unconditional instructions* on page F4-2456 cannot have a condition code, but the equivalent T32 instructions often can, and this usually appears in the *Assembler syntax* subsection as a statement that the A32 instruction cannot be conditional.

However, some such cases are too complex to describe in the available space, so the definitive test of whether an instruction is available in a given instruction set is whether there is an available encoding for it in that instruction set.

The assembly syntax given for an encoding is therefore a suitable one for a disassembler to disassemble that encoding to. However, disassemblers might wish to use simpler syntaxes when they are suitable for the operand combination, in order to produce more readable disassembled code.

- An encoding diagram, where:

  — For a 32-bit A32 encoding diagram, the bits are numbered from 31 to 0.

  — For a 16-bit T32 encoding diagram, the bits are numbered from 15 to 0.

    This halfword can be described as `hw1` of the instruction.

  — For a 32-bit T32 encoding diagram, the bits are numbered from 15 to 0 for each halfword, as a reminder that a 32-bit T32 instruction consists of two consecutive halfwords rather than a word.

    In this case, the left-hand halfword in the diagram is identified as `hw1`, and the right-hand halfword is identified as `hw2`.

  Where instructions are stored using the standard little-endian instruction endianness:

  — The encoding diagram for an A32 instruction at address A shows, from left to right, the bytes at addresses A+3, A+2, A+1, A.

  — The encoding diagram for a 32-bit T32 instruction shows bytes in the order A+1, A for `hw1`, followed by bytes A+3, A+2 for `hw2`.

- Encoding-specific pseudocode. This is pseudocode that translates the encoding-specific instruction fields into inputs to the encoding-independent pseudocode in the *Operation* subsection, and that picks out any special cases in the encoding. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see Appendix K11 *ARM Pseudocode Definition*.

Non-Confidential - Beta

F2.1.4 Assembler symbols

The *Assembly symbols* describes the standard UAL syntax for the instruction.

Each syntax description consists of the following elements:

- Descriptions of all of the variable or optional fields of the syntax.

  Some syntax fields are standardized across all or most instructions. *Standard assembler syntax fields* on page F2-2322 describes these fields.

  By default, syntax fields that specify registers, such as `<Rd>`, `<Rn>`, or `<Rt>`, can be any of R0-R12 or LR in T32 instructions, and any of R0-R12, SP or LR in A32 instructions. These require that the encoding-specific pseudocode set the corresponding integer variable (such as `d`, `n`, or `t`) to the corresponding register number, using 0-12 for R0-R12, 13 for SP, or 14 for LR:

  — Normally, software can do this by setting the corresponding field in the instruction, typically named Rd, Rn, Rt, to the binary encoding of that number.

  — In the case of 16-bit T32 encodings, the field is normally of length 3, and so the encoding is only available when the assembler syntax specifies one of R0-R7. Such encodings often use a register field name like Rdn. This indicates that the encoding is only available if `<Rd>` and `<Rn>` specify the same register, and that the register number of that register is encoded in the field if they do.

  The description of a syntax field that specifies a register sometimes extends or restricts the permitted range of registers or documents other differences from the default rules for such fields. Examples of extensions are permitting the use of the SP in a T32 instruction, or permitting the use of the PC, identified using register number 15.

- Where appropriate, text that briefly describes changes from the pre-UAL assembler syntax. Where present, this usually consists of an alternative pre-UAL form of the assembler mnemonic. The pre-UAL assembler syntax does not conflict with UAL. ARM recommends that it is supported, as an optional extension to UAL, so that pre-UAL assembler source files can be assembled.

Assembler syntax prototype line conventions

The following conventions are used in assembler syntax prototype lines and their subfields:

`< >` Any item bracketed by < and > is a short description of a type of value to be supplied by the user in that position. A longer description of the item is normally supplied by subsequent text. Such items often correspond to a similarly named field in an encoding diagram for an instruction. When the correspondence only requires the binary encoding of an integer value or register number to be substituted into the instruction encoding, it is not described explicitly. For example, if the assembler syntax for an instruction contains an item `<Rn>` and the instruction encoding diagram contains a 4-bit field named Rn, the number of the register specified in the assembler syntax is encoded in binary in the instruction field.

If the correspondence between the assembler syntax item and the instruction encoding is more complex than simple binary encoding of an integer or register number, the item description indicates how it is encoded. This is often done by specifying a required output from the encoding-specific pseudocode, such as `add = TRUE`. The assembler must only use encodings that produce that output.

`{ }` Any item bracketed by { and } is optional. A description of the item and of how its presence or absence is encoded in the instruction is normally supplied by subsequent text.

Many instructions have an optional destination register. Unless otherwise stated, if such a destination register is omitted, it is the same as the immediately following source register in the instruction syntax.

`#` In the assembler syntax, numeric constants are normally preceded by a #. Some UAL instruction syntax descriptions explicitly show this # as optional. Any UAL assembler:

- Must treat the # as optional where an instruction syntax description shows it as optional.
- Can treat the # either as mandatory or as optional where an instruction syntax description does not show it as optional.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Note

ARM recommends that UAL assemblers treat all uses of # shown in this manual as optional.

spaces Single spaces are used for clarity, to separate items. When a space is obligatory in the assembler syntax, two or more consecutive spaces are used.

+/- This indicates an optional + or - sign. If neither is coded, + is assumed.

All other characters must be encoded precisely as they appear in the assembler syntax. Apart from { and }, the special characters described above do not appear in the basic forms of assembler instructions documented in this manual. In a few places, the { and } characters must be encoded as part of a variable item. When this happens, the long description of the variable item indicates how they must be used.

F2.1.5 Pseudocode describing how the instruction operates

The *Operation for all classes* subsection contains encoding-independent pseudocode that describes the main operation of the instruction. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see Appendix K11 *ARM Pseudocode Definition*.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F2.2 Standard assembler syntax fields

The following assembler syntax fields are standard across all or most instructions:

`<c>` Is an optional field. It specifies the condition under which the instruction is executed. See *Conditional execution* on page F2-2323 for the range of available conditions and their encoding. If `<c>` is omitted, it defaults to *always* (`AL`).

`<q>` Specifies optional assembler qualifiers on the instruction. The following qualifiers are defined:

- `.N` Meaning narrow, specifies that the assembler must select a 16-bit encoding for the instruction. If this is not possible, an assembler error is produced.
- `.W` Meaning wide, specifies that the assembler must select a 32-bit encoding for the instruction. If this is not possible, an assembler error is produced.

If neither `.W` nor `.N` is specified, the assembler can select either 16-bit or 32-bit encodings. If both are available, it must select a 16-bit encoding. In a few cases, more than one encoding of the same length can be available for an instruction. The rules for selecting between such encodings are instruction-specific and are part of the instruction description. The assembler syntax includes a mandatory `.W` qualifier, along with a note describing the cases in which it applies, where this qualifier is required to select a particular encoding for an instruction. Additional assembler syntax will describe the syntax when the conditions are not met.

Note

When assembling to the A32 instruction set, the `.N` qualifier produces an assembler error and the `.W` qualifier has no effect.

Non-Confidential - Beta

F2.3 Conditional execution

Most T32 and A32 instructions can be executed conditionally, based on the values of the APSR condition flags. Table F2-1 lists the available conditions.

Table F2-1 Condition codes

cond	Mnemonic extension	Meaning (integer)	Meaning (floating-point) [a]	Condition flags
0000	EQ	Equal	Equal	Z == 1
0001	NE	Not equal	Not equal, or unordered	Z == 0
0010	CS [b]	Carry set	Greater than, equal, or unordered	C == 1
0011	CC [c]	Carry clear	Less than	C == 0
0100	MI	Minus, negative	Less than	N == 1
0101	PL	Plus, positive or zero	Greater than, equal, or unordered	N == 0
0110	VS	Overflow	Unordered	V == 1
0111	VC	No overflow	Not unordered	V == 0
1000	HI	Unsigned higher	Greater than, or unordered	C == 1 and Z == 0
1001	LS	Unsigned lower or same	Less than or equal	C == 0 or Z == 1
1010	GE	Signed greater than or equal	Greater than or equal	N == V
1011	LT	Signed less than	Less than, or unordered	N != V
1100	GT	Signed greater than	Greater than	Z == 0 and N == V
1101	LE	Signed less than or equal	Less than, equal, or unordered	Z == 1 or N != V
1110	None (AL) [d]	Always (unconditional)	Always (unconditional)	Any

a. Unordered means at least one NaN operand.
b. HS (unsigned higher or same) is a synonym for CS.
c. LO (unsigned lower) is a synonym for CC.
d. AL is an optional mnemonic extension for always, except in IT instructions. For details see *IT* on page F5-2592.

In T32 instructions, the condition, if it is not AL, is normally encoded in a preceding IT instruction. For more information see *Conditional instructions* on page F1-2285 and *IT* on page F5-2592. Some conditional branch instructions do not require a preceding IT instruction, because they include a condition code in their encoding.

In A32 instructions, bits[31:28] of the instruction contain either:

- The condition code, see *The condition code field in A32 instruction encodings* on page F2-2324.
- 0b1111 for some A32 instructions that can only be executed unconditionally.

ARM deprecates the conditional execution of any instruction encoding provided by Advanced SIMD that is not also provided by floating-point, and strongly recommends that:

- For A32 instructions, any such Advanced SIMD instruction that can be conditionally executed is executed with the <c> field omitted or set to AL.

  Note

  This applies only to VDUP, see *VDUP (general-purpose register)* on page F6-3266. The other A32 instructions do not permit conditional execution.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For T32 instructions, such Advanced SIMD instructions are never included in an IT block. This means they must be specified with the <c> field omitted or set to AL.

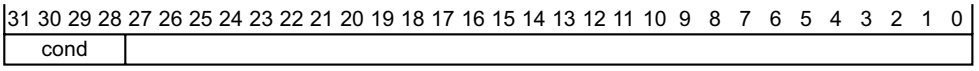
This deprecation does not apply to Advanced SIMD instruction encodings that are also available as floating-point instruction encodings. That is, it does not apply to the Advanced SIMD encodings of the instructions described in the following sections:

- *VLDM, VLDMDB, VLDMIA* on page F6-3326.
- *VLDR* on page F6-3329.
- *VMOV (general-purpose register to scalar)* on page F6-3379.
- *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page F6-3370.
- *VMRS* on page F6-3391.
- *VMSR* on page F6-3393.
- *VPOP* on page F6-3445.
- *VPUSH* on page F6-3447.
- *VSTM, VSTMDB, VSTMIA* on page F6-3607.
- *VSTR* on page F6-3610.

See also *Conditional execution of undefined instructions* on page G1-3709.

F2.3.1 The condition code field in A32 instruction encodings

Every conditional A32 instruction contains a 4-bit condition code field, the cond field, in bits 31 to 28:



This field contains one of the values 0b0000-0b1110, as shown in Table F2-1 on page F2-2323. Most instruction mnemonics can be extended with the letters defined in the *Mnemonic extension* on page F2-2323 column of that table.

If the *always* (AL) condition is specified, the instruction is executed irrespective of the value of the condition flags. The absence of a condition code on an instruction mnemonic implies the AL condition code.

F2.3.2 Pseudocode description of conditional execution

The AArch32.CurrentCond() function returns a 4-bit condition specifier as follows:

- For A32 instructions, it returns bits[31:28] of the instruction.
- For the T1 and T3 encodings of the Branch instruction (see *B* on page F5-2523), it returns the 4-bit cond field of the encoding.
- For all other T32 instructions:
  - If PSTATE.IT<3:0> != '0000' it returns PSTATE.IT<7:4>.
  - If PSTATE.IT<7:0> == '00000000' it returns '1110'.
  - Otherwise, execution of the instruction is CONSTRAINED UNPREDICTABLE.

  For more information, see *Process state, PSTATE* on page E1-2211.

The ConditionPassed() function uses this condition specifier and the condition flags to determine whether the instruction must be executed, by calling the ConditionHolds() function.

Chapter J1 *ARMv8 Pseudocode* includes the definitions of these functions.

Undefined Instruction exception on page G1-3707 describes the handling of conditional instructions that are UNDEFINED, UNPREDICTABLE, or CONSTRAINED UNPREDICTABLE. The pseudocode in the manual, as a sequential description of the instructions, has limitations in this respect. For more information, see *Limitations of the instruction pseudocode* on page K11-5516.

Non-Confidential - Beta

F2.4 Shifts applied to a register

A32 register offset load/store word and unsigned byte instructions can apply a wide range of different constant shifts to the offset register. Both T32 and A32 data-processing instructions can apply the same range of different constant shifts to the second operand register. For details see *Constant shifts*.

A32 data-processing instructions can apply a register-controlled shift to the second operand register.

F2.4.1 Constant shifts

These are the same in T32 and A32 instructions, except that the input bits come from different positions.

`<shift>` is an optional shift to be applied to `<Rm>`. It can be any one of:

(omitted) No shift.

`LSL #<n>` Logical shift left `<n>` bits. 1 <= `<n>` <= 31.

`LSR #<n>` Logical shift right `<n>` bits. 1 <= `<n>` <= 32.

`ASR #<n>` Arithmetic shift right `<n>` bits. 1 <= `<n>` <= 32.

`ROR #<n>` Rotate right `<n>` bits. 1 <= `<n>` <= 31.

`RRX` Rotate right one bit, with extend. Bit[0] is written to `shifter_carry_out`, bits[31:1] are shifted right one bit, and the Carry flag is shifted into bit[31].

Note

Assemblers can permit the use of some or all of `ASR #0`, `LSL #0`, `LSR #0`, and `ROR #0` to specify that no shift is to be performed. This is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must omit the shift specifier when the instruction specifies no shift.

Similarly, assemblers can permit the use of `#0` in the immediate forms of `ASR`, `LSL`, `LSR`, and `ROR` instructions to specify that no shift is to be performed, that is, that a `MOV` (register) instruction is wanted. Again, this is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must use the `MOV` (register) syntax when the instruction specifies no shift.

Encoding

The assembler encodes `<shift>` into two type bits and five immediate bits, as follows:

(omitted) type = `0b00`, immediate = 0.

`LSL #<n>` type = `0b00`, immediate = `<n>`.

`LSR #<n>` type = `0b01`.
If `<n>` < 32, immediate = `<n>`.
If `<n>` == 32, immediate = 0.

`ASR #<n>` type = `0b10`.
If `<n>` < 32, immediate = `<n>`.
If `<n>` == 32, immediate = 0.

`ROR #<n>` type = `0b11`, immediate = `<n>`.

`RRX` type = `0b11`, immediate = 0.

Non-Confidential - Beta

F2.4.2 Register controlled shifts

These are only available in A32 instructions.

<type> is the type of shift to apply to the value read from <Rm>. It must be one of:

ASR — Arithmetic shift right, encoded as type = 0b10.

LSL — Logical shift left, encoded as type = 0b00.

LSR — Logical shift right, encoded as type = 0b01.

ROR — Rotate right, encoded as type = 0b11.

The bottom byte of <Rs> contains the shift amount.

F2.4.3 Pseudocode description of instruction-specified shifts and rotates

The pseudocode enumeration SRType{} defines the shift types. Shift and rotate instruction decode is described by the pseudocode function:

- DecodeImmShift() for a constant shift.
- DecodeRegShift() for a register controlled shift.

Shift and rotate operations are made by the pseudocode function Shift().

F2.5 Memory accesses

Commonly, the following addressing modes are permitted for memory access instructions:

Offset addressing

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access. The value of the base register is unchanged.

The assembly language syntax for this mode is:

`[<Rn>, <offset>]`

Pre-indexed addressing

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access, and written back into the base register.

The assembly language syntax for this mode is:

`[<Rn>, <offset>]!`

Post-indexed addressing

The address obtained from the base register is used, unchanged, as the address for the memory access. The offset value is applied to the address, and written back into the base register

The assembly language syntax for this mode is:

`[<Rn>], <offset>`

In each case, `<Rn>` is the base register. `<offset>` can be:

- An immediate constant, such as `<imm8>` or `<imm12>`.
- An index register, `<Rm>`.
- A shifted index register, such as `<Rm>, LSL #<shift>`.

For information about unaligned access, endianness, and exclusive access, see:

- *Alignment support* on page E2-2239.
- *Endian support* on page E2-2241.
- *Synchronization and semaphores* on page E2-2271.

F2.6 Encoding of lists of general-purpose registers and the PC

A number of instructions operate on lists of general-purpose registers. For some load instructions, the list of registers to be loaded can include the PC. For these instructions, the assembler syntax includes a `<registers>` field, that provides a list of the registers to be operated on, with list entries separated by commas.

The registers list is encoded in the instruction encoding. Most often, this is done using an 8-bit, 13-bit, or 16-bit `register_list` field. This section gives more information about these and other possible register list encodings.

In a `register_list` field, each bit corresponds to a single register, and if the `<registers>` field of the assembler instruction includes Rt then `register_list<t>` is set to 1, otherwise it is set to 0.

The full rules for the encoding of lists of general-purpose registers, and possibly the PC, are:

- Except for the cases listed here, 16-bit T32 encodings use an 8-bit register list, and can access only registers R0-R7.

  The exceptions to this rule are:

  — The T1 encoding of `POP` uses an 8-bit register list, and an additional bit, `P`, that corresponds to the PC. This means it can access any of R0-R7 and the PC.

  — The T1 encoding of `PUSH` uses an 8-bit register list, and an additional bit, `M`, that corresponds to the LR. This means it can access any of R0-R7 and the LR.

- 32-bit T32 encodings of load operations use a 13-bit register list, and two additional bits, `M`, corresponding to the LR, and `P`, corresponding to the PC. This means these instructions can access any of R0-R12 and the LR and PC.

- 32-bit T32 encodings of store operations use a 13-bit register list, and one additional bit, `M`, corresponding to the LR. This means these instructions can access any of R0-R12 and the LR.

- Except for the case listed here, A32 encodings use a 16-bit register list. This means these instructions can access any of R0-R12 and the SP, LR, and PC.

  The exception to this rule is:

  — The system instructions `LDM` (exception return) and `LDM` (User registers) use a 15-bit register list. This means these instructions can access any of R0-R12 and the SP and LR.

- The T3 and A2 encodings of `POP`, and the T3 and A2 encodings of `PUSH`, access a single register from the set of registers {R0-R12, LR, PC} and encode the register number in the `Rt` field.

Note

`POP` is a load operation, and `PUSH` is a store operation.

In every case, the encoding-specific pseudocode converts the register list into a 32-bit variable, `registers`, with a bit corresponding to each of the registers R0-R12, SP, LR, and PC.

Note

Some floating-point and Advanced SIMD instructions operate on lists of SIMD and floating-point registers. The assembler syntax of these instructions includes a `<list>` field that specifies the registers to be operated on, and the description of the instruction in *Alphabetical list of T32 and A32 base instruction set instructions* on page F5-2476 defines the use and encoding of this field.

F2.7 About the T32 and A32 instruction encodings

Chapter F3 *The T32 Instruction Set Encoding* describes the T32 instruction encodings, and Chapter F4 *The A32 Instruction Set Encoding* describes the A32 instruction encodings. The following subsections give more information about these encodings:

- *UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space*.
- *Advanced SIMD and floating-point instruction encodings* on page F2-2330.
- *The PC and the use of 0b1111 as a register specifier* on page F2-2334.
- *The SP and the use of 0b1101 as a register specifier* on page F2-2335.
- *Modified immediate constants* on page F2-2335.

F2.7.1 UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space

An attempt to execute an unallocated instruction results in either:

- Unpredictable behavior. The instruction is described as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE.

  ARMv8-A greatly reduces the architecturally UNPREDICTABLE behavior in AArch32 state. Most cases that earlier versions of the architecture describe as UNPREDICTABLE become either:

  — CONSTRAINED UNPREDICTABLE, meaning the architecture defines a limited range of permitted behaviors.

  — Fully predictable.

  For more information see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

- An Undefined Instruction exception. The instruction is described as UNDEFINED.

An instruction is UNDEFINED if it is declared as UNDEFINED in an instruction description, or in Chapter F3 *The T32 Instruction Set Encoding* or Chapter F4 *The A32 Instruction Set Encoding*.

An instruction is UNPREDICTABLE only if:

- It is declared as UNPREDICTABLE in an instruction description or in Chapter F3 or Chapter F4, and Appendix K1 does not redefine the behavior as CONSTRAINED UNPREDICTABLE.
- The pseudocode for that encoding does not indicate that a different special case applies, and a bit marked (0) or (1) in the encoding diagram of an instruction is not 0 or 1 respectively. In most cases, ARMv8 makes these cases CONSTRAINED UNPREDICTABLE, as described in *SBZ or SBO fields in instructions* on page K1-5292.

Unless otherwise specified, T32 and A32 instructions provided as part of an architectural extension, or by an optional feature of the architecture, are UNDEFINED in an implementation that does not include that extension or feature.

Note

Examples of where this rule applies are:

- The instructions provided by the Cryptographic Extension.
- The system instructions that provide access to the System registers of the OPTIONAL Performance Monitors Extension.
- The Advanced SIMD and floating-point instructions.

For more information about UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction behavior, see *Undefined Instruction exception* on page G1-3707.

For more information about the behavior of T32 and A32 instructions in earlier versions of the architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

F2.7.2 Advanced SIMD and floating-point instruction encodings

The T32 and A32 encodings of Advanced SIMD and floating-point instructions that are described in Chapter F3 *The T32 Instruction Set Encoding* and in Chapter F4 *The A32 Instruction Set Encoding* are common to the T32 and A32 instruction sets. This means:

- The instruction groups, and the set of instructions in each group, are identical for T32 and A32.
- For each instruction:
  - Each T32 encoding is exactly equivalent to an A32 encoding.
  - There is no T32 encoding without an equivalent A32 encoding, and no A32 encoding without an equivalent T32 encoding.

Note

- In the T32 instruction sets, the Advanced SIMD and floating-point instructions have 32-bit encodings.
- In the base instruction sets, some instructions are common to the T32 and A32 instruction sets, whereas other instructions have equivalent but not identical functionality in the two instruction sets.

32-bit T32 encodings are described as two contiguous halfwords, `{hw1:hw2}`, as described in *Instruction encodings* on page F2-2318. In general:

- `hw1` of a T32 encoding maps onto bits[31:16] of an equivalent A32 encoding.
- `hw2` of a T32 encoding maps onto bits[15:0] of an equivalent A32 encoding.

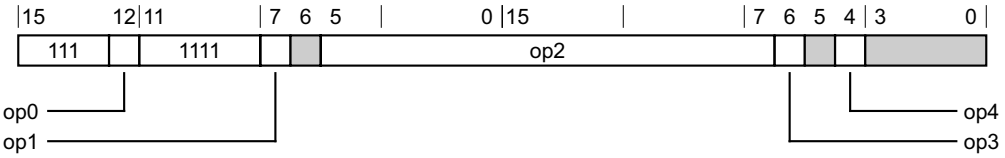
However, the different structures of the T32 instruction encoding space and the A32 instruction encoding space mean that:

- For a given Advanced SIMD and floating-point instruction group:
  - The positions of the fields that identify the instruction, or instruction encoding, within the instruction group might differ between the T32 encodings and the A32 encodings.
  - However, the field values that identify the instruction of instruction encoding are identical for the T32 encoding and the A32 encoding.

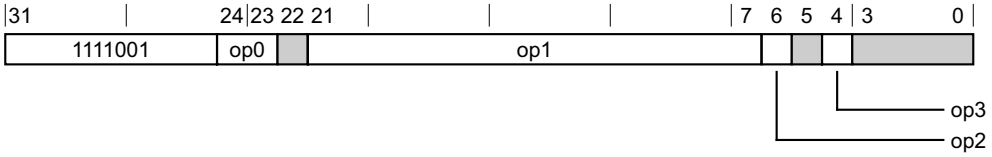
The remainder of this section describes the equivalence of the T32 and A32 encodings for each of the Advanced SIMD and floating-point instruction groups.

Advanced SIMD data-processing

The T32 encoding of the Advanced SIMD data-processing group is:



The A32 encoding of the Advanced SIMD data-processing group is:



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The encodings in this group are identified by:

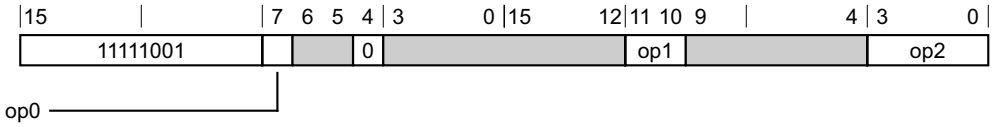
- `hw1`[15:13] of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and:
  - Has the value `0b111` in the T32 encoding.
  - Has the value `0b001` in the A32 encoding.
- `hw1`[11:8] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and has the value `0b111`.

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

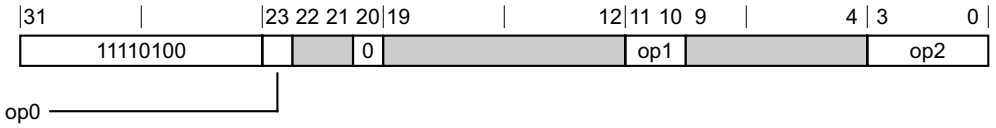
T32 encoding	A32 encoding	Field size
`op0:op1`	`op0`	2 bits
`op2`	`op1`	15 bits
`op3`	`op2`	1 bit
`op4`	`op3`	1 bit

Advanced SIMD element or structure load/store

The T32 encoding of the Advanced SIMD element or structure load/store group is:



The A32 encoding of the Advanced SIMD element or structure load/store group is:



The encodings in this group are identified by:

- `hw1`[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and has the value `0b1111`.
- `hw1`[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and:
  - Has the value `0b1001` in the T32 encoding.
  - Has the value `0b0100` in the A32 encoding.
- `hw1`[4] of the T32 encoding is equivalent to bit[20] of the A32 encoding, and has the value `0b0`.

`op0`, `op1`, and `op2` are the fields that identify the instructions, or instruction encodings, within this group, and they are in equivalent positions in the T32 and A32 encodings.

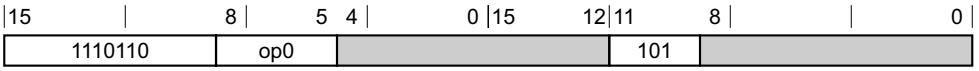
Non-Confidential - Beta

Floating-point and Advanced SIMD load/store and 64-bit register moves

The T32 encoding of the Floating-point and Advanced SIMD load/store and 64-bit register moves group is:



The A32 encoding of the Floating-point and Advanced SIMD load/store and 64-bit register moves group is:

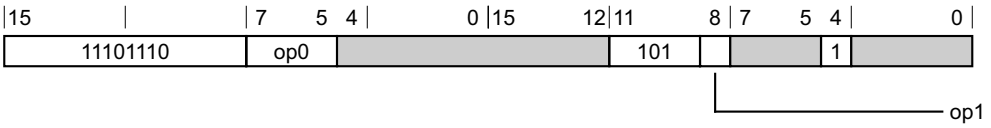
The encodings in the group are identified by:

- `hw1`[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - Has the value `0b1110` in the T32 encoding.
  - Can have any value other than `0b1111` in the A32 encoding.
    This range of values is required because A32 instructions in this group can be executed conditionally, see *Conditional execution* on page F2-2323.
- `hw1`[11:9] of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and has the value `0b110`.
- `hw2`[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value `0b101`.

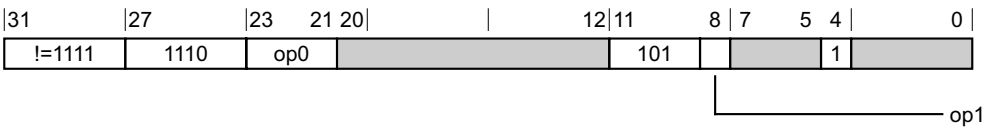
`op0` is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

Floating-point and Advanced SIMD 32-bit register moves

The T32 encoding of the Floating-point and Advanced SIMD 32-bit register moves group is:



The A32 encoding of the Advanced SIMD 32-bit register moves group is:



The encodings in this group are identified by:

- `hw1`[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - Has the value `0b1110` in the T32 encoding.
  - Can have any value other than `0b1111` in the A32 encoding.
    This range of values is required because A32 instructions in this group can be executed conditionally, see *Conditional execution* on page F2-2323.
- `hw1`[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value `0b1110`.

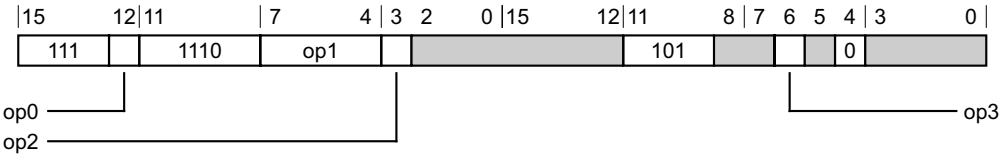
Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.
- hw2[4:0] of the T32 encoding is equivalent to bits[4:0] of the A32 encoding, and has the value 0b11111.

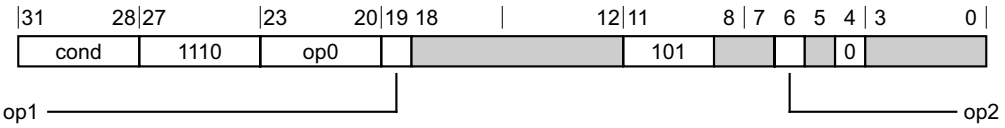
op0 is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

Floating-point data-processing

The T32 encoding of the Floating-point data-processing group is:



The A32 encoding of the Floating-point data-processing group is:



The encodings in this group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - In the T32 encoding, hw1[15:13] has the value 0b111, and hw1[12] is the op0 parameter used in identifying instruction encodings within this group.
  - In the A32 encoding, is the cond field and also implies the value of bit[28] of some A32 instruction encodings within this group, as the following table shows:

cond	Significance of bit[28] in A32 encodings
!= 0b1111	Part of the cond field.
0b1111	Has fixed value of 1.

    The range of cond values other than 0b1111 is required because A32 instructions in this group can be executed conditionally, see *Conditional execution* on page F2-2323.
- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value 0b1110.
- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.
- hw2[4] of the T32 encoding is equivalent to bit[4] of the A32 encoding, and has the value 0b0.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

T32 encoding	A32 encoding
op0	Bit[28] of the instruction encoding is 1 when cond is 0b1111.
op1	op0
op2	op1
op3	op2

F2.7.3 The PC and the use of 0b1111 as a register specifier

Restrictions on the use of PC or 0b1111 as a register specifier differ between the T32 and the A32 instruction sets, as described in:

- *T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier*.
- *A32 restrictions on the use of PC or 0b1111 as a register specifier* on page F2-2335.

T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier

The use of 0b1111 as a register specifier is not normally permitted in T32 instructions. When a value of 0b1111 is permitted, a variety of meanings is possible. For register reads, these meanings include:

- Read the PC value, that is, the address of the current instruction + 4. The base register of the table branch instructions TBB and TBH can be the PC. This means branch tables can be placed in memory immediately after the instruction.

  Note

  ARM deprecates use of the PC as the base register in the STC instruction.

- Read the word-aligned PC value, that is, the address of the current instruction + 4, with bits[1:0] forced to zero. The base register of LDC, LDR, LDRB, LDRD (pre-indexed, no writeback), LDRH, LDRSB, and LDRSH instructions can be the word-aligned PC. This provides PC-relative data addressing. In addition, some encodings of the ADD and SUB instructions permit their source registers to be 0b1111 for the same purpose.
- Read zero. This is done in some cases when one instruction is a special case of another, more general instruction, but with one operand zero. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.

For register writes, these meanings include:

- The PC can be specified as the destination register of an LDR instruction. This is done by encoding Rt as 0b1111. The loaded value is treated as an address, and the effect of execution is a branch to that address. Bit[0] of the loaded value selects whether to execute A32 or T32 instructions after the branch.
- Some other instructions write the PC in similar ways. An instruction can specify that the PC is written:
  - Implicitly, for example, branch instructions.
  - Explicitly by a register specifier of 0b1111, for example 16-bit MOV (register) instructions.
  - Explicitly by using a register mask, for example LDM instructions.

  The address to branch to can be:
  - A loaded value, for example, RFE.
  - A register value, for example, BX.
  - The result of a calculation, for example, TBB or TBH.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The method of choosing the instruction set used after the branch can be:

— Similar to the LDR case, for example, LDM or BX.

— A fixed instruction set other than the one currently being used, for example, the immediate form of BLX.

— Unchanged, for example, branch instructions or 16-bit MOV (register) instructions.

— Set from the SPSR.T bit, for RFE and SUBS PC, LR, #imm8.

- Discard the result of a calculation. This is done in some cases when one instruction is a special case of another, more general instruction, but with the result discarded. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.
- If the destination register specifier of an LDRB, LDRH, LDRSB, or LDRSH instruction is 0b1111, the instruction is a memory hint instead of a load operation.
- If the destination register specifier of an MRC instruction is 0b1111, bits[31:28] of the value transferred from the coprocessor are written to the N, Z, C, and V condition flags in the APSR, and bits[27:0] are discarded.

A32 restrictions on the use of PC or 0b1111 as a register specifier

In A32 instructions, the use of 0b1111 as a register specifier specifies the PC.

Many instructions are CONSTRAINED UNPREDICTABLE if they use 0b1111 as a register specifier. This is specified by pseudocode in the instruction description. ARMv8-A constrains the resulting CONSTRAINED UNPREDICTABLE behavior, see *Using R15* on page K1-5289.

Note

ARM deprecates use of the PC as the base register in any store instruction.

F2.7.4 The SP and the use of 0b1101 as a register specifier

In the T32 and A32 instruction sets, ARM strongly recommends that the use of 0b1101 as a register specifier specifies the SP, and deprecates using SP (R13) for any purpose other than as a stack pointer.

Note

- The recommendation that register specifier 0b1101 is used only to specify the SP applies to both the T32 and the A32 instruction sets.
- Despite this recommendation, in ARMv8, most T32 uses of R13 as a general-purpose register behave predictably. This differs from ARMv7, where many uses of R13 are UNPREDICTABLE. For more information, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

F2.7.5 Modified immediate constants

The following sections describe the encoding of modified immediate constants:

- *Modified immediate constants in T32 instructions* on page F2-2336.
- *Modified immediate constants in A32 instructions* on page F2-2337.
- *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2338.
- *Modified immediate constants in T32 and A32 floating-point instructions* on page F2-2339.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Modified immediate constants in T32 instructions

The encoding of a modified immediate constant in a 32-bit T32 instruction is:

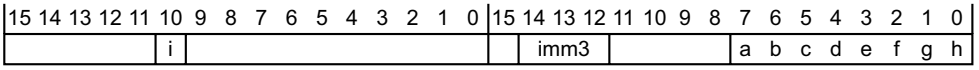


Table F2-2 shows the range of modified immediate constants available in T32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, h, and i bits, and the imm3 field, in the instruction.

Table F2-2 Encoding of modified immediates in T32 data-processing instructions

i:imm3:a	<const> [a]
0000x	`00000000 00000000 00000000 abcdefgh`
0001x	`00000000 abcdefgh 00000000 abcdefgh` [b]
0010x	`abcdefgh 00000000 abcdefgh 00000000` [b]
0011x	`abcdefgh abcdefgh abcdefgh abcdefgh` [b]
01000	`1bcdefgh 00000000 00000000 00000000`
01001	`01bcdefg h0000000 00000000 00000000` [c]
01010	`001bcdef gh000000 00000000 00000000`
01011	`0001bcde fgh00000 00000000 00000000` [c]
.	.
.	. 8-bit values shifted to other positions
.	.
11101	`00000000 00000000 000001bc defgh000` [c]
11110	`00000000 00000000 0000001b cdefgh00`
11111	`00000000 00000000 00000001 bcdefgh0` [c]

a. This table shows the immediate constant value in binary form, to relate `abcdefgh` to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

b. ARM deprecates using a modified immediate with abcdefgh == 00000000, and these cases are CONSTRAINED UNPREDICTABLE, see *UNPREDICTABLE cases in immediate constants in T32 data-processing instructions* on page K1-5293.

c. Not available in A32 instructions if `h` == 1.

Note

As the footnotes to Table F2-2 show, the range of values available in T32 modified immediate constants is slightly different from the range of values available in A32 instructions. See *Modified immediate constants in A32 instructions* on page F2-2337 for the A32 values.

Carry out

A logical instruction with i:imm3:a == '00xxx' does not affect the Carry flag. Otherwise, a logical flag-setting instruction sets the Carry flag to the value of bit[31] of the modified immediate constant.

Operation of modified immediate constants, T32 instructions

For a T32 data-processing instruction, the `T32ExpandImm()` pseudocode function returns the value of the 32-bit immediate constant, calling `T32ExpandImm_C()` to evaluate the constant.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Modified immediate constants in A32 instructions

The encoding of a modified immediate constant in an A32 instruction is:

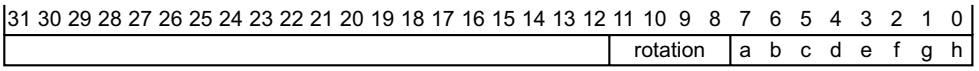

Table F2-3 shows the range of modified immediate constants available in A32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, and h bits and the rotation field in the instruction.

Table F2-3 Encoding of modified immediates in A32 processing instructions

rotation	<const> [a]
0000	`00000000 00000000 00000000 abcdefgh`
0001	`gh000000 00000000 00000000 00abcdef`
0010	`efgh0000 00000000 00000000 0000abcd`
0011	`cdefgh00 00000000 00000000 000000ab`
0100	`abcdefgh 00000000 00000000 00000000`
. . .	. . . 8-bit values shifted to other even-numbered positions
1001	`00000000 00abcdef gh000000 00000000`
. . .	. . . 8-bit values shifted to other even-numbered positions
1110	`00000000 00000000 0000abcd efgh0000`
1111	`00000000 00000000 000000ab cdefgh00`

a. This table shows the immediate constant value in binary form, to relate `abcdefgh` to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

Note

The range of values available in A32 modified immediate constants is slightly different from the range of values available in 32-bit T32 instructions. See *Modified immediate constants in T32 instructions* on page F2-2336.

Carry out

A logical instruction with the rotation field set to `0b0000` does not affect APSR.C. Otherwise, a logical flag-setting instruction sets APSR.C to the value of bit[31] of the modified immediate constant.

Constants with multiple encodings

Some constant values have multiple possible encodings. In this case, a UAL assembler must select the encoding with the lowest unsigned value of the rotation field. This is the encoding that appears first in Table F2-3. For example, the constant `#3` must be encoded with (rotation, abcdefgh) == (`0b0000`, `0b00000011`), not (`0b0001`, `0b00001100`), (`0b0010`, `0b00110000`), or (`0b0011`, `0b11000000`).

In particular, this means that all constants in the range 0-255 are encoded with rotation == `0b0000`, and permitted constants outside that range are encoded with rotation != `0b0000`. A flag-setting logical instruction with a modified immediate constant therefore leaves APSR.C unchanged if the constant is in the range 0-255 and sets it to the most significant bit of the constant otherwise. This matches the behavior of T32 modified immediate constants for all constants that are permitted in both the A32 and T32 instruction sets.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

An alternative syntax is available for a modified immediate constant that permits the programmer to specify the encoding directly. In this syntax, `#<const>` is instead written as `#<byte>, #<rot>`, where:

`<byte>` Is the numeric value of abcdefgh, in the range 0-255.

`<rot>` Is twice the numeric value of rotation, an even number in the range 0-30.

This syntax permits all A32 data-processing instructions with modified immediate constants to be disassembled to assembler syntax that assembles to the original instruction.

This syntax also makes it possible to write variants of some flag-setting logical instructions that have different effects on APSR.C to those obtained with the normal `#<const>` syntax. For example, `ANDS R1, R2, #12, #2` has the same behavior as `ANDS R1, R2, #3` except that it sets APSR.C to 0 instead of leaving it unchanged. Such variants of flag-setting logical instructions do not have equivalents in the T32 instruction set, and ARM deprecates their use.

Operation of modified immediate constants, A32 instructions

For an A32 data-processing instruction, the `A32ExpandImm()` pseudocode function returns the value of the 32-bit immediate constant, calling `A32ExpandImm_C()` to evaluate the constant.

Modified immediate constants in T32 and A32 Advanced SIMD instructions

Table F2-4 shows the modified immediate constants available with Advanced SIMD instructions, and how they are encoded.

Table F2-4 Modified immediate values for Advanced SIMD instructions

op	cmode	Constant[a]	<dt>[b]	Notes
-	000x	`00000000 00000000 00000000 abcdefgh 00000000 00000000 00000000 abcdefgh`	I32	c
	001x	`00000000 00000000 abcdefgh 00000000 00000000 00000000 abcdefgh 00000000`	I32	c, d
	010x	`00000000 abcdefgh 00000000 00000000 00000000 abcdefgh 00000000 00000000`	I32	c, d
	011x	`abcdefgh 00000000 00000000 00000000 abcdefgh 00000000 00000000 00000000`	I32	c, d
	100x	`00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh`	I16	c
	101x	`abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000`	I16	c, d
	1100	`00000000 00000000 abcdefgh 11111111 00000000 00000000 abcdefgh 11111111`	I32	d, e
	1101	`00000000 abcdefgh 11111111 11111111 00000000 abcdefgh 11111111 11111111`	I32	d, e
0	1110	`abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh`	I8	f
	1111	`aBbbbbbc defgh000 00000000 00000000 aBbbbbbc defgh000 00000000 00000000`	F32	f, g
1	1110	`aaaaaaaa bbbbbbbb cccccccc dddddddd eeeeeeee ffffffff gggggggg hhhhhhhh`	I64	f
	1111	UNDEFINED	-	-

a. In this table, the immediate value is shown in binary form, to relate abcdefgh to the encoding diagram. In assembler syntax, the constant is specified by a data type and a value of that type. That value is specified in the normal way (a decimal number by default) and is replicated enough times to fill the 64-bit immediate. For example, a data type of `I32` and a value of 10 specify the 64-bit constant `0x0000000A0000000A`.

b. This specifies the data type used when the instruction is disassembled. On assembly, the data type must be matched in the table if possible. Other data types are permitted as pseudo-instructions when a program is assembled, provided the 64-bit constant specified by the data type and value is available for the instruction. If a constant is available in more than one way, the first entry in this table that can produce it is used. For example, `VMOV.I64 D0, #0x8000000080000000` does not specify a 64-bit constant that is available from the I64 line of the table, but does specify one that is available from the fourth I32 line or the F32 line. It is assembled to the first of these, and therefore is disassembled as `VMOV.I32 D0, #0x80000000`.

c. This constant is available for the `VBIC`, `VMOV`, `VMVN`, and `VORR` instructions.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

d. CONSTRAINED UNPREDICTABLE if `abcdefgh == 0b00000000`, see *UNPREDICTABLE cases in immediate constants in Advanced SIMD instructions* on page K1-5293. The required behavior is that these encodings produce an immediate constant of zero.

e. This constant is available for the `VMOV` and `VMVN` instructions only.

f. This constant is available for the `VMOV` instruction only.

g. In this entry, `B = NOT(b)`. The bit pattern represents the floating-point number $(-1)^S \times 2^{exp} \times$ mantissa, where S = `UInt(a)`, exp = `UInt(NOT(b):c:d)-3` and mantissa = `(16+UInt(e:f:g:h))/16`.

Operation of modified immediate constants, Advanced SIMD instructions

For a T32 or A32 Advanced SIMD instruction that uses a modified immediate constant, the operation described by the `AdvSIMDExpandImm()` pseudocode function returns the value of the 64-bit immediate constant.

Modified immediate constants in T32 and A32 floating-point instructions

Table F2-5 shows the immediate constants available in the `VMOV` (immediate) floating-point instruction.

Table F2-5 Floating-point modified immediate constants

Data type	imm4H	imm4L	Constant [a]
`F32`	abcd	efgh	`aBbbbbbc defgh000 00000000 00000000`
`F64`	abcd	efgh	`aBbbbbbb bbcdefgh 00000000 00000000 00000000 00000000 00000000 00000000`

a. In this column, `B = NOT(b)`. The bit pattern represents the floating-point number $(-1)^S \times 2^{exp} \times$ mantissa, where S = `UInt(a)`, exp = `UInt(NOT(b):c:d)-3` and mantissa = `(16+UInt(e:f:g:h))/16`.

Operation of modified immediate constants, floating-point instructions

For a T32 or A32 floating-point instruction that uses a modified immediate constant, the operation described by the `VFPExpandImm()` pseudocode function returns the value of the immediate constant.

F2.8 Additional pseudocode support for instruction descriptions

Earlier sections of this chapter include pseudocode that describes features of the execution of A32 and T32 instructions, see:

- *Pseudocode description of conditional execution* on page F2-2324.
- *Pseudocode description of instruction-specified shifts and rotates* on page F2-2326

The following subsection gives additional pseudocode support functions for some of the instructions described in *Alphabetical list of T32 and A32 base instruction set instructions* on page F5-2476. See also *Pseudocode support for the Banked register transfer instructions* on page F5-3105.

F2.8.1 Pseudocode description of coprocessor operations

The `Coproc_CheckInstr()` pseudocode function determines whether a coprocessor instruction is accepted for execution.

The `Coproc_DoneLoading()` pseudocode function determines, for an `LDC` instruction, whether enough words have been loaded.

The `Coproc_DoneStoring()` function determines for an `STC` instruction whether enough words have been stored.

The `Coproc_GetOneWord()` function obtains the word for an `MRC` instruction from the coprocessor.

The `Coproc_GetTwoWords()` function obtains the two words for an `MRRC` instruction from the coprocessor.

Note

The relative significance of the two words returned is IMPLEMENTATION DEFINED, but all uses within this manual present the two words in the order (most significant, least significant).

The `Coproc_GetWordToStore()` function obtains the next word to store for an `STC` instruction from the coprocessor.

The `Coproc_InternalOperation()` procedure instructs a coprocessor to perform the internal operation requested by a `CDP` instruction.

The `Coproc_SendLoadedWord()` procedure sends a loaded word for an `LDC` instruction to the coprocessor.

The `Coproc_SendOneWord()` procedure sends the word for an `MCR` instruction to the coprocessor.

The `Coproc_SendTwoWords()` procedure sends the two words for an `MCRR` instruction to the coprocessor.

Note

The relative significance of `word2` and `word1` is IMPLEMENTATION DEFINED, but all uses within this manual treat `word2` as more significant than `word1`.

The `CP14DebugInstrDecode()` pseudocode function decodes an accepted access to a CP14 debug register.

The `CP14JazelleInstrDecode()` pseudocode function decodes an accepted access to a CP14 Jazelle register.

The `CP14TraceInstrDecode()` pseudocode function decodes an accepted access to a CP14 Trace register.

The `CP15InstrDecode()` pseudocode function decodes an accepted access to a CP15 register.

F2.8.2 Pseudocode details of system calls

The `AArch32.CallSupervisor()` pseudocode function generates a Supervisor Call exception. Valid execution of the `SVC` instruction calls this function.

The `AArch32.CallHypervisor()` pseudocode function generates an HVC exception. Valid execution of the `HVC` instruction calls this function.

F2.9 Additional information about Advanced SIMD and floating-point instructions

This section gives additional information about the Advanced SIMD and floating-point instructions.

Note

The Advanced SIMD architecture, its associated implementations, and supporting software, are commonly referred to as NEON™ technology.

F2.9.1 Advanced SIMD and floating-point instruction syntax

Advanced SIMD and floating-point instructions use the general conventions of the T32 and A32 instruction sets.

Advanced SIMD and floating-point data-processing instructions use the following general format:

```
V{<modifier>}<operation>{<shape>}{<c>}{<q>}{.<dt>}  {<dest>,} <src1>, <src2>
```

All Advanced SIMD and floating-point instructions begin with a `V`. This distinguishes Advanced SIMD vector and floating-point instructions from scalar instructions.

The main operation is specified in the `<operation>` field. It is usually a three letter mnemonic the same as or similar to the corresponding scalar integer instruction.

The `<c>` and `<q>` fields are standard assembler syntax fields. For details see *Standard assembler syntax fields* on page F2-2322.

F2.9.2 Advanced SIMD addressing mode

All the element and structure load/store instructions use this addressing mode. There is a choice of three formats:

`[<Rn>{:<align>}]`

The address is contained in general-purpose register Rn.

Rn is not updated by this instruction.

Encoded as Rm = `0b1111`.

If Rn is encoded as `0b1111`, the instruction is CONSTRAINED UNPREDICTABLE.

`[<Rn>{:<align>}]!`

The address is contained in general-purpose register Rn.

Rn is updated by this instruction: `Rn = Rn + transfer_size`

Encoded as Rm = `0b1101`.

`transfer_size` is the number of bytes transferred by the instruction. This means that, after the instruction is executed, Rn points to the address in memory immediately following the last address loaded from or stored to.

If Rn is encoded as `0b1111`, the instruction is CONSTRAINED UNPREDICTABLE.

This addressing mode can also be written as:

`[<Rn>{:align}], #<transfer_size>`

However, disassembly produces the `[<Rn>{:align}]!` form.

`[<Rn>{:<align>}], <Rm>`

The address is contained in general-purpose register `<Rn>`.

Rn is updated by this instruction: `Rn = Rn + Rm`

Encoded as Rm = Rm. Rm must not be encoded as `0b1111` or `0b1101`, the PC or the SP.

If Rn is encoded as `0b1111`, the instruction is CONSTRAINED UNPREDICTABLE.

The CONSTRAINED UNPREDICTABLE behavior of encodings where Rn is `0b1111` is that the instruction is either UNDEFINED or executes as a `NOP`, see *CONSTRAINED UNPREDICTABLE behavior for A32 memory hints, Advanced SIMD instructions, and miscellaneous instructions* on page K1-5298.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In all cases, <align> specifies an alignment., as specified by the individual instruction descriptions.

Previous versions of the manual used the @ character for alignment. So, for example, the first format in this section was shown as [<Rn>{@<align>}]. Both @ and : are supported. However, to ensure portability of code to assemblers that treat @ as a comment character, : is preferred.

F2.9.3 Advanced SIMD instruction modifiers

The <modifier> field provides additional variants of some instructions. Table F2-6 provides definitions of the modifiers. Modifiers are not available for every instruction.

Table F2-6 Advanced SIMD instruction modifiers

<modifier>	Meaning
Q	The operation uses saturating arithmetic.
R	The operation performs rounding.
D	The operation doubles the result (before accumulation, if any).
H	The operation halves the result.

F2.9.4 Advanced SIMD operand shapes

The <shape> field provides additional variants of some instructions. Table F2-7 provides definitions of the shapes. Operand shapes are not available for every instruction.

Table F2-7 Advanced SIMD operand shapes

<shape>	Meaning	Typical register shape	
(none)	The operands and result are all the same width.	Dd, Dn, Dm	Qd, Qn, Qm
L	Long operation - result is twice the width of both operands	Qd, Dn, Dm	
N	Narrow operation - result is half the width of both operands	Dd, Qn, Qm	
W	Wide operation - result and first operand are twice the width of the second operand	Qd, Qn, Dm	

Note

- Some assemblers support a Q shape specifier, that requires all operands to be Q registers. An example of using this specifier is `VADDQ.S32 q0, q1, q2`. This is not standard UAL, and ARM recommends that programmers do not use a Q shape specifier.
- A disassembler must not generate any shape specifier not shown in Table F2-7.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F2.9.5 Data type specifiers

The <dt> field normally contains one data type specifier. Unless the assembler syntax description for the instruction indicates otherwise, this indicates the data type contained in:

- The second operand, if any.
- The operand, if there is no second operand.
- The result, if there are no operand registers.

The data types of the other operand and result are implied by the <dt> field combined with the instruction shape. For information about data type formats see *Data types supported by the Advanced SIMD implementation* on page E1-2219.

In the instruction syntax descriptions in Chapter F2 *About the T32 and A32 Instruction Descriptions*, the <dt> field is usually specified as a single field. However, where more convenient, it is sometimes specified as a concatenation of two fields, <type><size>.

Syntax flexibility

There is some flexibility in the data type specifier syntax:

- Software can specify three data types, specifying the result and both operand data types. For example:

  `VSUBW.I16.I16.S8 Q3, Q5, D0` instead of `VSUBW.S8 Q3, Q5, D0`

- Software can specify two data types, specifying the data types of the two operands. The data type of the result is implied by the instruction shape. For example:

  `VSUBW.I16.S8 Q3, Q5, D0` instead of `VSUBW.S8 Q3, Q5, D0`

- Software can specify two data types, specifying the data types of the single operand and the result. For example:

  `VMOVN.I16.I32 D0, Q1` instead of `VMOVN.I32 D0, Q1`

- Where an instruction requires a less specific data type, software can instead specify a more specific type, as shown in Table F2-8.

- Where an instruction does not require a data type, software can provide one.

- The `F32` data type can be abbreviated to `F`.

- The `F64` data type can be abbreviated to `D`.

In all cases, if software provides additional information, the additional information must match the instruction shape. Disassembly does not regenerate this additional information.

Table F2-8 Data type specification flexibility

Specified data type	Permitted more specific data types				
None	Any				
.I<size>	-	.S<size>	.U<size>	-	-
.8	.I8	.S8	.U8	.P8	-
.16	.I16	.S16	.U16	.P16	.F16
.32	.I32	.S32	.U32	-	.F32 or .F
.64	.I64	.S64	.U64	-	.F64 or .D

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F2.9.6 Register specifiers

The <dest>, <src1>, and <src2> fields contain register specifiers, or in some cases scalar specifiers or register lists. Table F2-9 shows the register and scalar specifier formats that appear in the instruction descriptions.

If <dest> is omitted, it is the same as <src1>.

Table F2-9 Advanced SIMD and floating-point register specifier formats

<specifier>	Usual meaning [a]	Used in
<Qd>	A quadword destination register for the result vector.	Advanced SIMD
<Qn>	A quadword source register for the first operand vector.	Advanced SIMD
<Qm>	A quadword source register for the second operand vector.	Advanced SIMD
<Dd>	A doubleword destination register for the result vector.	Both
<Dn>	A doubleword source register for the first operand vector.	Both
<Dm>	A doubleword source register for the second operand vector.	Both
<Sd>	A singleword destination register for the result vector.	Floating-point
<Sn>	A singleword source register for the first operand vector.	Floating-point
<Sm>	A singleword source register for the second operand vector.	Floating-point
<Dd[x]>	A destination scalar for the result. Element x of vector <Dd>.	Advanced SIMD
<Dn[x]>	A source scalar for the first operand. Element x of vector <Dn>.	Both [b]
<Dm[x]>	A source scalar for the second operand. Element x of vector <Dm>.	Advanced SIMD
<Rt>	A general-purpose register, used for a source or destination address.	Both
<Rt2>	A general-purpose register, used for a source or destination address.	Both
<Rn>	A general-purpose register, used as a load or store base address.	Both
<Rm>	A general-purpose register, used as a post-indexed address source.	Both

a. In some instructions the roles of registers are different.

b. In the floating-point instructions, <Dn[x]> is used only in VMOV (scalar to general-purpose register), see *VMOV (scalar to general-purpose register)* on page F6-3383.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F2.9.7 Register lists

A register list is a list of register specifiers separated by commas and enclosed in brackets { and }. There are restrictions on what registers can appear in a register list. These restrictions are described in the individual instruction descriptions. Table F2-10 shows some register list formats, with examples of actual register lists corresponding to those formats.

Note

Register lists must not wrap around the end of the register bank.

Syntax flexibility

There is some flexibility in the register list syntax:

- Where a register list contains consecutive registers, they can be specified as a range, instead of listing every register, for example `{D0-D3}` instead of `{D0, D1, D2, D3}`.
- Where a register list contains an even number of consecutive doubleword registers starting with an even numbered register, it can be written as a list of quadword registers instead, for example `{Q1, Q2}` instead of `{D2-D5}`.
- Where a register list contains only one register, the enclosing braces can be omitted, for example `VLD1.8 D0, [R0]` instead of `VLD1.8 {D0}, [R0]`.

Table F2-10 Example register lists

Format	Example	Alternative
`{<Dd>}`	`{D3}`	`D3`
`{<Dd>, <Dd+1>, <Dd+2>}`	`{D3, D4, D5}`	`{D3-D5}`
`{<Dd[x]>, <Dd+2[x]}`	`{D0[3], D2[3]}`	-
`{<Dd[]>}`	`{D7[]}`	`D7[]`

F2.9.8 Register encoding

An Advanced SIMD register is either:

- *Quadword*, meaning it is 128 bits wide.
- *Doubleword*, meaning it is 64 bits wide.

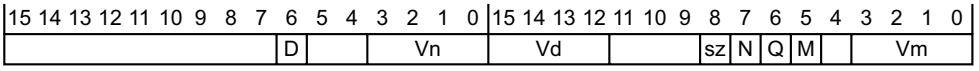
Some instructions have options for either doubleword or quadword registers. This is normally encoded in Q, bit[6], as Q = 0 for doubleword operations, or Q = 1 for quadword operations.

A floating-point register is either:

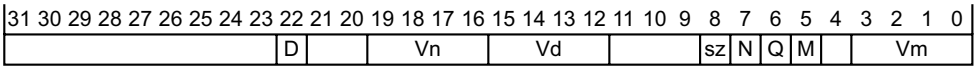
- Double-precision, meaning it is 64 bits wide.
- Single-precision, meaning it is 32 bits wide.

This is encoded in the sz field, bit[8], as sz = 1 for double-precision operations, or sz = 0 for single-precision operations.

The T32 instruction encoding of Advanced SIMD or floating-point registers is:



The A32 instruction encoding of Advanced SIMD or floating-point registers is:



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Some instructions use only one or two registers, and use the unused register fields as additional opcode bits.

Table F2-11 shows the encodings for the registers.

Table F2-11 Encoding of register numbers

Register mnemonic	Usual usage	Register number encoded in[a]	Notes[a]	Used in
<Qd>	Destination (quadword)	D, Vd (bits[22, 15:13])	bit[12] == 0[b]	Advanced SIMD
<Qn>	First operand (quadword)	N, Vn (bits[7, 19:17])	bit[16] == 0[b]	Advanced SIMD
<Qm>	Second operand (quadword)	M, Vm (bits[5, 3:1])	bit[0] == 0[b]	Advanced SIMD
<Dd>	Destination (doubleword)	D, Vd (bits[22, 15:12])	-	Both
<Dn>	First operand (doubleword)	N, Vn (bits[7, 19:16])	-	Both
<Dm>	Second operand (doubleword)	M, Vm (bits[5, 3:0])	-	Both
<Sd>	Destination (single-precision)	Vd, D (bits[15:12, 22])	-	Floating-point
<Sn>	First operand (single-precision)	Vn, N (bits[19:16, 7])	-	Floating-point
<Sm>	Second operand (single-precision)	Vm, M (bits[3:0, 5])	-	Floating-point

a. Bit numbers given for the A32 instruction encoding. See the figures in this section for the equivalent bits in the T32 encoding.
b. If this bit is 1, the instruction is UNDEFINED.

F2.9.9 Advanced SIMD scalars

Advanced SIMD scalars can be 8-bit, 16-bit, 32-bit, or 64-bit. Instructions other than multiply instructions can access any element in the register set. The instruction syntax refers to the scalars using an index into a doubleword vector. The descriptions of the individual instructions contain details of the encodings.

Table F2-12 shows the form of encoding for scalars used in multiply instructions. These instructions cannot access scalars in some registers. The descriptions of the individual instructions contain cross references to this section where appropriate.

32-bit Advanced SIMD scalars, when used as single-precision floating-point numbers, are equivalent to Floating-point single-precision registers. That is, `Dm[x]` in a 32-bit context (0 <= `m` <= 15, 0 <= `x` <=1) is equivalent to `S[2m + x]`.

Table F2-12 Encoding of scalars in multiply instructions

Scalar mnemonic	Usual usage	Scalar size	Register specifier	Index specifier	Accessible registers
<Dm[x]>	Second operand	16-bit	Vm[2:0]	M, Vm[3]	D0-D7
		32-bit	Vm[3:0]	M	D0-D15

Chapter F3
The T32 Instruction Set Encoding

This chapter introduces the T32 instruction set and describes how it uses the ARM programmers' model. It contains the following sections:

- *Top level T32 instruction set encoding* on page F3-2348.
- *16-bit T32 instruction encoding* on page F3-2350.
- *32-bit T32 instruction encoding* on page F3-2361.

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F3.1 Top level T32 instruction set encoding

The T32 instruction stream is treated as a sequence of halfword-aligned halfwords. Each T32 instruction is either a single 16-bit halfword in that stream, or a 32-bit instruction consisting of two consecutive halfwords in that stream.

When the value of bits[15:11] of the halfword being decoded is one of the following, the halfword is the first halfword of a 32-bit instruction:

- `0b11101`.
- `0b11110`.
- `0b11111`.

Otherwise, the halfword is a 16-bit instruction.

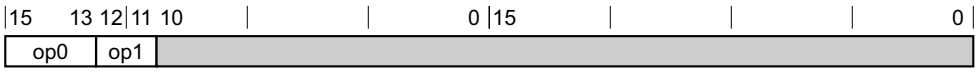

Table F3-1 Main encoding table for the T32 instruction set

Decode fields		Decode group or instruction page
op0	op1	
!= 111	-	*16-bit T32 instruction encoding* on page F3-2350
111	00	B - T2 variant
111	!= 00	*32-bit T32 instruction encoding* on page F3-2361

The behavior of an attempt to execute an unallocated instruction is described in *UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space* on page F2-2329.

F3.1.1 About the T32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All T32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit T32 instruction decode structure. Table F3-2 shows these instruction groups, and where each group is decoded from the overall T32 decode structure:

Table F3-2 Advanced SIMD and floating-point instructions in the T32 decode structure

Advanced SIMD and floating-point instruction group	T32 decode is from
Advanced SIMD data-processing on page F3-2369	*Coprocessor, Advanced SIMD, and floating-point instructions* on page F3-2362
Floating-point data-processing on page F3-2364	*Coprocessor, Advanced SIMD, and floating-point instructions* on page F3-2362

Chapter F4
The A32 Instruction Set Encoding

This chapter describes the encoding of the A32 instruction set. It contains the following sections:

- *Top level A32 instruction set encoding* on page F4-2414.
- *Data-processing and miscellaneous instructions* on page F4-2416.
- *Load/Store Word, Unsigned Byte (immediate, literal)* on page F4-2433.
- *Load/Store Word, Unsigned Byte (register)* on page F4-2434.
- *Media instructions* on page F4-2435.
- *Branch, branch with link, and block data transfer* on page F4-2443.
- *Coprocessor instructions, and Supervisor Call* on page F4-2445.
- *Unconditional instructions* on page F4-2456.

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

Non-Confidential - Beta

F4.1 Top level A32 instruction set encoding

The A32 instruction stream is a sequence of word-aligned words. Each A32 instruction is a single 32-bit word in that stream. The encoding of an A32 instruction is:

Most A32 instructions can be conditional, with a condition determined by bits[31:28] of the instruction, the `cond` field. For more information, see *The condition code field in A32 instruction encodings* on page F2-2324. This applies to all instructions except those with the `cond` field equal to `0b1111`.

Table F4-1 shows the top-level encoding of the A32 instruction set, including the cases where bits[31:28] are defined as `0b1111` rather than as the `cond`.

The behavior of an attempt to execute an unallocated instruction is described in *UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space* on page F2-2329.

For more information on A32 instruction encodings see Chapter F2 *About the T32 and A32 Instruction Descriptions*.

F4.1.1 About the A32 Advanced SIMD and floating-point instructions and their encodings

The Advanced SIMD and floating-point instructions are common to the A32 and T32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

Different groups of the A32 Advanced SIMD and floating-point instructions are decoded from different points in the A32 instruction decode structure. Table F4-2 on page F4-2415 shows these instruction groups, and where each group is decoded from the overall A32 decode structure:

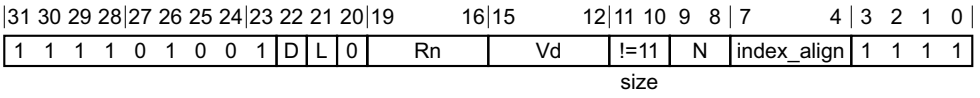
Advanced SIMD load/store single structure to one lane (no writeback)

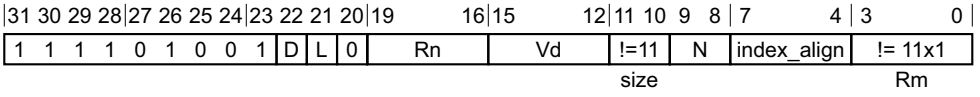
This section describes the encoding of the Advanced SIMD load/store single structure to one lane (no writeback) instruction class. This section is decoded from *Advanced SIMD element or structure load/store* on page F4-2469.



Decode fields		Instruction Page
L	N	
0	00	VST1 (single element from one lane)
0	01	VST2 (single 2-element structure from one lane)
0	10	VST3 (single 3-element structure from one lane)
0	11	VST4 (single 4-element structure from one lane)
1	00	VLD1 (single element to one lane)
1	01	VLD2 (single 2-element structure to one lane)
1	10	VLD3 (single 3-element structure to one lane)
1	11	VLD4 (single 4-element structure to one lane)

Advanced SIMD load/store single structure to one lane (register, post-indexed)

This section describes the encoding of the Advanced SIMD load/store single structure to one lane (register, post-indexed) instruction class. This section is decoded from *Advanced SIMD element or structure load/store* on page F4-2469.



Decode fields		Instruction Page
L	N	
0	00	VST1 (single element from one lane)
0	01	VST2 (single 2-element structure from one lane)
0	10	VST3 (single 3-element structure from one lane)

Chapter F5
T32 and A32 Base Instruction Set Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of T32 and A32 base instruction set instructions* on page F5-2476.
- *Encoding and use of Banked register transfer instructions* on page F5-3102.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1 Alphabetical list of T32 and A32 base instruction set instructions

This section lists every instruction in the T32 and A32 base instruction sets. For details of the format used see *Format of instruction descriptions* on page F2-2318.

This section is formatted so that each instruction description starts on a new page.

F5.1.1 ADC, ADCS (immediate)

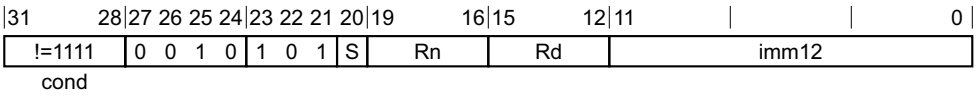
Add with Carry (immediate) adds an immediate value and the Carry flag value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ADC variant

Applies when S == 0.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ADCS variant

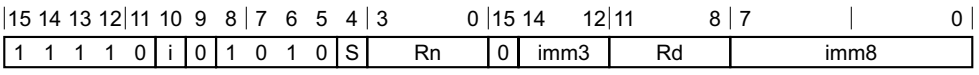
Applies when S == 1.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



ADC variant

Applies when S == 0.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ADCS variant

Applies when S == 1.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE;  // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.2 ADC, ADCS (register)

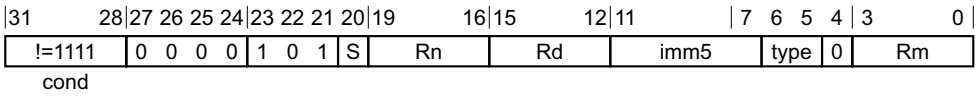
Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ADC, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADC, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ADCS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADCS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

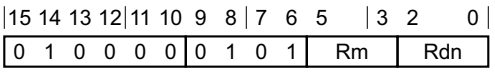
```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T1



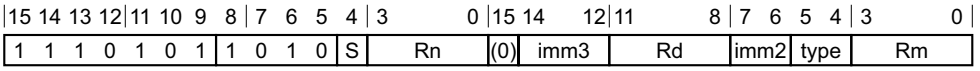
T1 variant

```
ADC<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
ADCS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



ADC, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADC, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADC<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ADCS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADCS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADCS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential - Beta

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdn>` Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if `ADCS <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `ADCS <Rd>, <Rn>` had been written.
- Inside an IT block, if `ADC<c> <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `ADC<c> <Rd>, <Rn>` had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

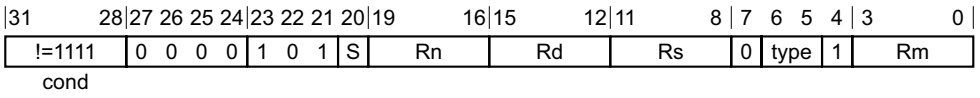
```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.3 ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Non-Confidential - Beta

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Non-Confidential - Beta

F5.1.4 ADD, ADDS (immediate)

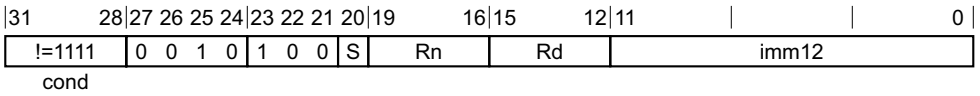
Add (immediate) adds an immediate value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ADD variant

Applies when S == 0 && Rn != 11x1.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ADDS variant

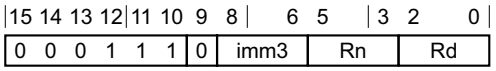
Applies when S == 1 && Rn != 1101.

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rn == '1111' && S == '0' then SEE ADR;
if Rn == '1101' then SEE ADD (SP plus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



T1 variant

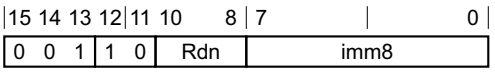
```
ADD<c>{<q>} <Rd>, <Rn>, #<imm3> // Inside IT block
ADDS{<q>} <Rd>, <Rn>, #<imm3> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm3, 32);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



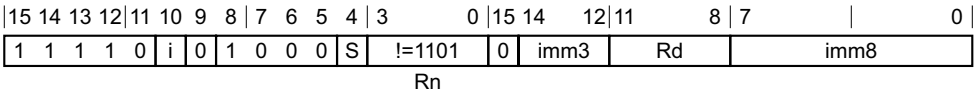
T2 variant

```
ADD<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
ADD<c>{<q>} {<Rdn>,} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
ADDS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
ADDS{<q>} {<Rdn>,} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);
```

T3



ADD variant

Applies when `S == 0`.

```
ADD<c>.W {<Rd>,} <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or
T2
ADD{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ADDS variant

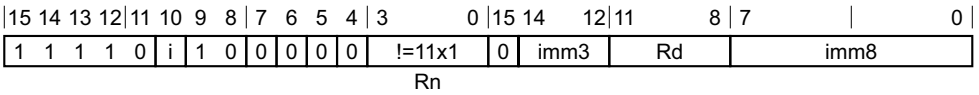
Applies when `S == 1 && Rd != 1111`.

```
ADDS.W {<Rd>,} <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
ADDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMN (immediate);
if Rn == '1101' then SEE ADD (SP plus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T4



T4 variant

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
ADDW{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then SEE ADR;
if Rn == '1101' then SEE ADD (SP plus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;   // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdn>` Is the general-purpose source and destination register, encoded in the "Rdn" field.

`<imm8>` Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.

For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus immediate). If the PC is used, see ADR.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus immediate).

`<imm3>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

When multiple encodings of the same length are available for an instruction, encoding T3 is preferred to encoding T4 (if encoding T4 is required, use the `ADDW` syntax). Encoding T1 is preferred to encoding T2 if `<Rd>` is specified and encoding T2 is preferred to encoding T1 if `<Rd>` is omitted.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        (result, nzcv) = AddWithCarry(R[n], imm32, '0');
        if d == 15 then          // Can only occur for A32 encoding
            if setflags then
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
                    ALUExceptionReturn(result);
                else
                    ALUWritePC(result);
            else
                R[d] = result;
                if setflags then
                    PSTATE.<N,Z,C,V> = nzcv;
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            (result, nzcv) = AddWithCarry(R[n], imm32, '0');
            R[d] = result;
            if setflags then
                PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.5 ADD, ADDS (register)

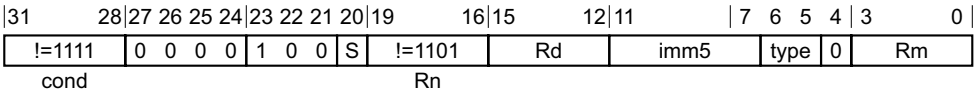
Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ADD, rotate right with extend variant

Applies when S == 0 && imm5 == 00000 && type == 11.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADD, shift or rotate by value variant

Applies when S == 0 && !(imm5 == 00000 && type == 11).

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ADDS, rotate right with extend variant

Applies when S == 1 && imm5 == 00000 && type == 11.

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADDS, shift or rotate by value variant

Applies when S == 1 && !(imm5 == 00000 && type == 11).

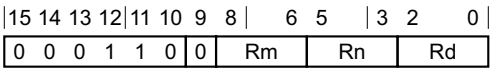
```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rn == '1101' then SEE ADD (SP plus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T1



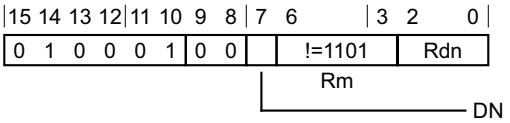
T1 variant

```
ADD<c>{<q>} <Rd>, <Rn>, <Rm> // Inside IT block
ADDS{<q>} {<Rd>,} <Rn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



T2 variant

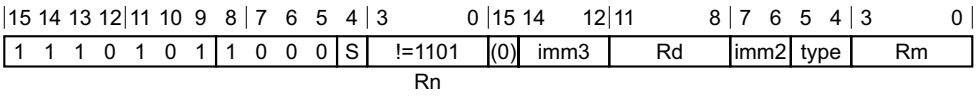
Applies when `!(DN == 1 && Rdn == 101)`.

```
ADD<c>{<q>} <Rdn>, <Rm> // Preferred syntax, Inside IT block
ADD{<c>}{<q>} {<Rdn>,} <Rdn>, <Rm>
```

Decode for this encoding

```
if (DN:Rdn) == '1101' || Rm == '1101' then SEE ADD (SP plus register);
d = UInt(DN:Rdn);  n = d;  m = UInt(Rm);  setflags = FALSE;  (shift_t, shift_n) = (SRType_LSL, 0);
if n == 15 && m == 15 then UNPREDICTABLE;
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T3



ADD, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADD, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADD<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1 or T2
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ADDS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADDS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
ADDS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1 or T2
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMN (register);
if Rn == '1101' then SEE ADD (SP plus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdn>` Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211. The assembler language allows `<Rdn>` to be specified once or twice in the assembler syntax. When used inside an IT block, and `<Rdn>` and `<Rm>` are in the range R0 to R7, `<Rdn>` must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when `<Rdn>` is specified once or twice.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. When used inside an IT block, `<Rd>` must be specified. When used outside an IT block, `<Rd>` is optional, and:

- If omitted, this register is the same as `<Rn>`.
- If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see ADD, ADDS (SP plus register).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus register).

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rm>` For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

`ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Inside an IT block, if `ADD<c> <Rd>, <Rn>, <Rd>` cannot be assembled using encoding T1, it is assembled using encoding T2 as though `ADD<c> <Rd>, <Rn>` had been written. To prevent this happening, use the `.W` qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

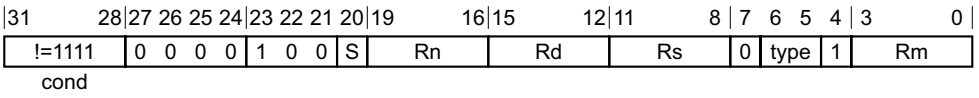
Non-Confidential - Beta

F5.1.6 ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

F5.1.7 ADD, ADDS (SP plus immediate)

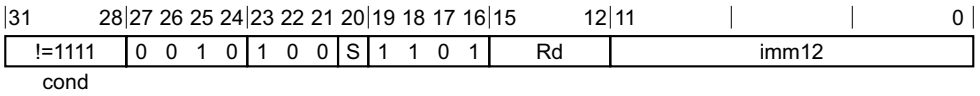
Add to SP (immediate) adds an immediate value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ADD variant

Applies when `S == 0`.

```
ADD{<c>}{<q>} {<Rd>,} SP, #<const>
```

ADDS variant

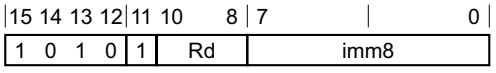
Applies when `S == 1`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



T1 variant

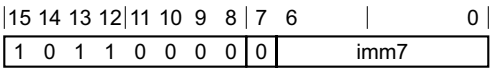
```
ADD{<c>}{<q>} <Rd>, SP, #<imm8>
```

Decode for this encoding

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(imm8:'00', 32);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



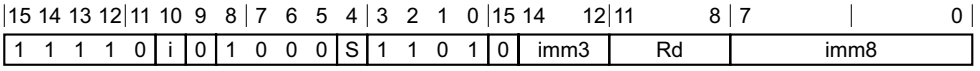
T2 variant

```
ADD{<c>}{<q>} {SP,} SP, #<imm7>
```

Decode for this encoding

```
d = 13;  setflags = FALSE;  imm32 = ZeroExtend(imm7:'00', 32);
```

T3



ADD variant

Applies when `S == 0`.

```
ADD{<c>}.W {<Rd>,} SP, #<const> // <Rd>, <const> can be represented in T1 or T2
ADD{<c>}{<q>} {<Rd>,} SP, #<const>
```

ADDS variant

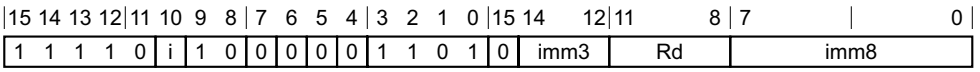
Applies when `S == 1 && Rd != 1111`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMN (immediate);
d = UInt(Rd);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

T4



T4 variant

```
ADD{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
ADDW{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Decode for this encoding

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<imm7> Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

For encoding T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm8> Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, imm32, '0');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.8 ADD, ADDS (SP plus register)

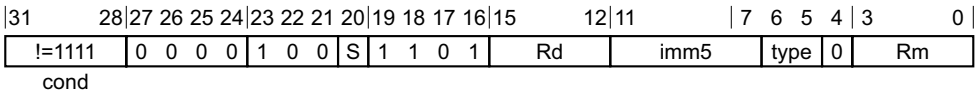
Add to SP (register) adds an optionally-shifted register value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ADDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ADD, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
ADD{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

ADD, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
ADD{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

ADDS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

ADDS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

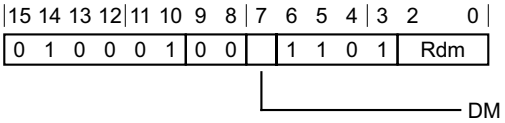
T1



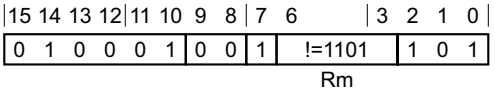
T1 variant

```
ADD{<c>}{<q>} {<Rdm>,} SP, <Rdm>
```

Decode for this encoding

```
d = UInt(DM:Rdm);  m = UInt(DM:Rdm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T2



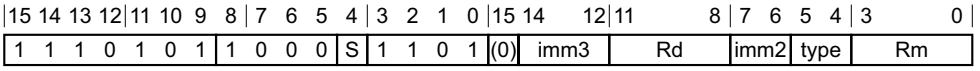
T2 variant

```
ADD{<c>}{<q>} {SP,} SP, <Rm>
```

Decode for this encoding

```
if Rm == '1101' then SEE encoding T1;
d = 13;  m = UInt(Rm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

T3



ADD, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ADD{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

ADD, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADD{<c>.W {<Rd>,} SP, <Rm> // <Rd>, <Rm> can be represented in T1 or T2
ADD{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

ADDS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

ADDS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMN (register);
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdm>` Is the general-purpose destination and second source register, encoded in the "Rdm" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

`<Rm>` For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T3: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

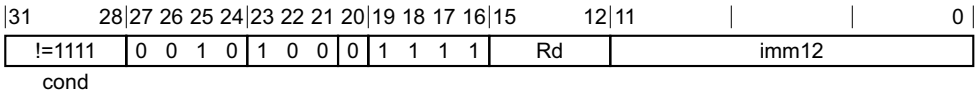
F5.1.9 ADD (immediate, to PC)

Add to PC adds an immediate value to the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias.

This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

A1



A1 variant

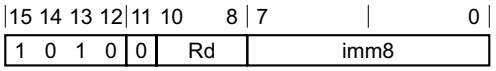
```
ADD{<c>}{<q>} <Rd>, PC, #<const>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

T1



T1 variant

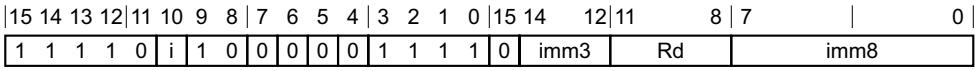
```
ADD{<c>}{<q>} <Rd>, PC, #<imm8>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

T3



T3 variant

```
ADDW{<c>}{<q>} <Rd>, PC, #<imm12> // <Rd>, <imm12> can be represented in T1
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

```
ADD{<c>}{<q>} <Rd>, PC, #<imm12>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T1 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<label>` For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-2337.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

`<imm8>` Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` An immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

Operation for all encodings

The description of ADR gives the operational pseudocode for this instruction.

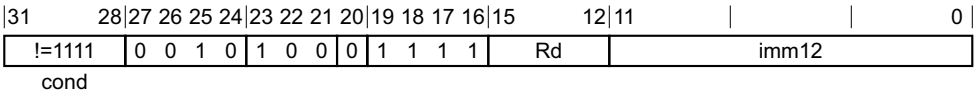
Non-Confidential - Beta

F5.1.10 ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

This instruction is used by the aliases ADD (immediate, to PC) and SUB (immediate, from PC). See the *Alias conditions* on page F5-2505 table for details of when each alias is preferred.

A1



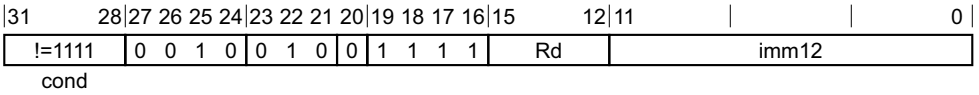
A1 variant

```
ADR{<c>}{<q>} <Rd>, <label>
```

Decode for this encoding

```
d = UInt(Rd);  imm32 = A32ExpandImm(imm12);  add = TRUE;
```

A2



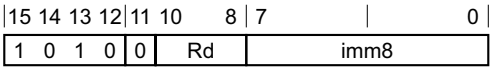
A2 variant

```
ADR{<c>}{<q>} <Rd>, <label>
```

Decode for this encoding

```
d = UInt(Rd);  imm32 = A32ExpandImm(imm12);  add = FALSE;
```

T1



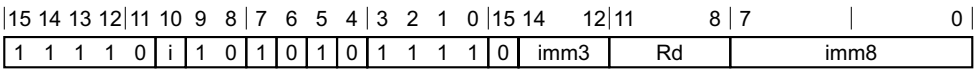
T1 variant

```
ADR{<c>}{<q>} <Rd>, <label>
```

Decode for this encoding

```
d = UInt(Rd);  imm32 = ZeroExtend(imm8:'00', 32);  add = TRUE;
```

T2



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

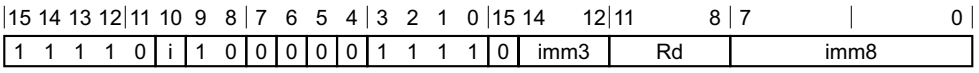
T2 variant

```
ADR{<c>}{<q>} <Rd>, <label>
```

Decode for this encoding

```
d = UInt(Rd);  imm32 = ZeroExtend(i:imm3:imm8, 32);  add = FALSE;
if d == 15 then UNPREDICTABLE;     // ARMv8-A removes UNPREDICTABLE for R13
```

T3



T3 variant

```
ADR{<c>}.W <Rd>, <label> // <Rd>, <label> can be presented in T1
ADR{<c>}{<q>} <Rd>, <label>
```

Decode for this encoding

```
d = UInt(Rd);  imm32 = ZeroExtend(i:imm3:imm8, 32);  add = TRUE;
if d == 15 then UNPREDICTABLE;   // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Alias conditions

Alias	of variant	is preferred when
ADD (immediate, to PC)	-	`Never`
SUB (immediate, from PC)	T2	`i:imm3:imm8 = '000000000000'`
SUB (immediate, from PC)	A2	`imm12==000000000000`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1 and A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<label>` For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-2337.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

The instruction aliases permit the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if d == 15 then          // Can only occur for A32 encodings
        ALUWritePC(result);
    else
        R[d] = result;
```

F5.1.11 AND, ANDS (immediate)

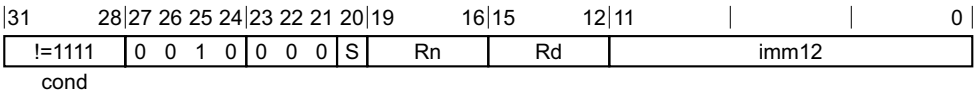
Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



AND variant

Applies when S == 0.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ANDS variant

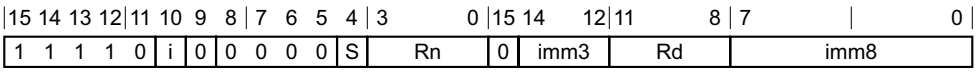
Applies when S == 1.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



AND variant

Applies when S == 0.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ANDS variant

Applies when S == 1 && Rd != 1111.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TST (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.12 AND, ANDS (register)

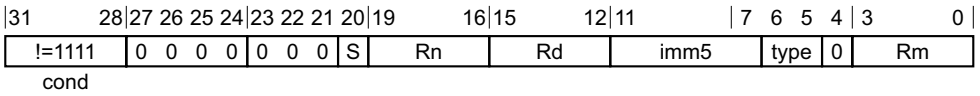
Bitwise AND (register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



AND, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

AND, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ANDS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ANDS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

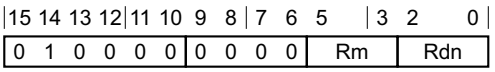
```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T1



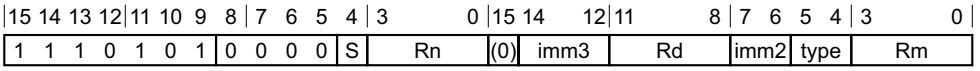
T1 variant

```
AND<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
ANDS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



AND, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

AND, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
AND<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ANDS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11`.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ANDS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
ANDS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TST (register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdn>` Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if `ANDS <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `ANDS <Rd>, <Rn>` had been written.
- Inside an IT block, if `AND<c> <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `AND<c> <Rd>, <Rn>` had been written.

To prevent either of these happening, use the `.W` qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

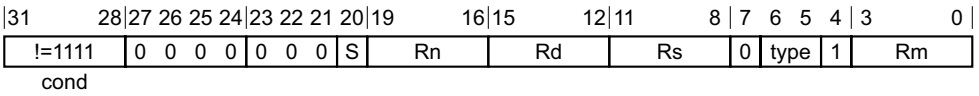
```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.13 AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Non-Confidential - Beta

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

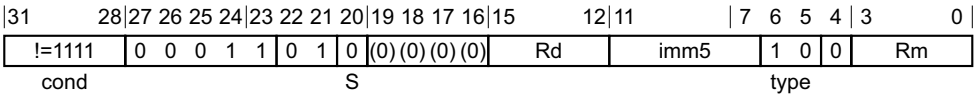
F5.1.14 ASR (immediate)

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOV, shift or rotate by value variant

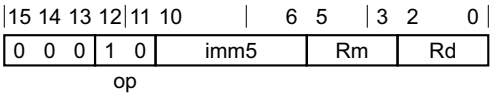
```
ASR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

T2



T2 variant

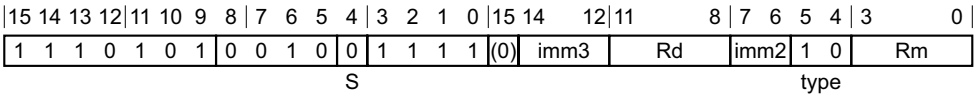
```
ASR<c>{<q>} {<Rd>,} <Rm>, #<imm> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is the preferred disassembly when `InITBlock()`.

T3



MOV, shift or rotate by value variant

```
ASR<c>.W {<Rd>,} <Rm>, #<imm> // Inside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

```
ASR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

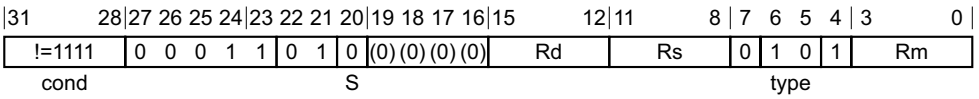
F5.1.15 ASR (register)

Arithmetic Shift Right (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

A1



Not flag setting variant

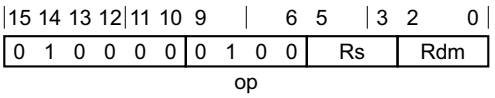
```
ASR{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

and is always the preferred disassembly.

T1



Arithmetic shift right variant

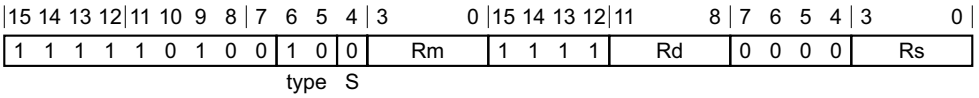
```
ASR<c>{<q>} {<Rdm>,} <Rdm>, <Rs> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs>
```

and is the preferred disassembly when `InITBlock()`.

T2



Not flag setting variant

```
ASR<c>.W {<Rd>,} <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

and is always the preferred disassembly.

```
ASR{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

and is always the preferred disassembly.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<Rdm>`	Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
`<Rd>`	Is the general-purpose destination register, encoded in the "Rd" field.
`<Rm>`	Is the first general-purpose source register, encoded in the "Rm" field.
`<Rs>`	Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

F5.1.16 ASRS (immediate)

Arithmetic Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

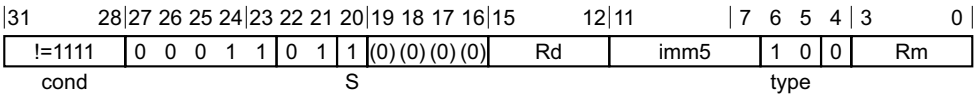
The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOVS, shift or rotate by value variant

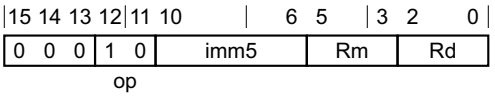
```
ASRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

T2



T2 variant

```
ASRS{<q>} {<Rd>,} <Rm>, #<imm> // Outside IT block
```

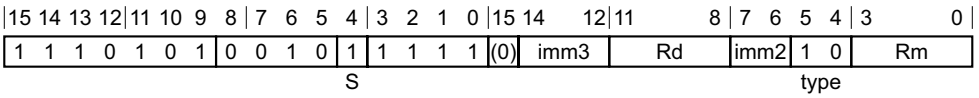
is equivalent to

```
MOVS{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is the preferred disassembly when `!InITBlock()`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T3



MOVS, shift or rotate by value variant

```
ASRS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

```
ASRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

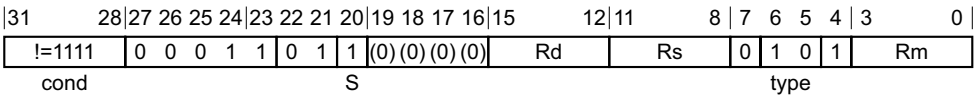
F5.1.17 ASRS (register)

Arithmetic Shift Right, setting flags (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, writes the result to the destination register, and updates the condition flags based on the result. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

A1



Flag setting variant

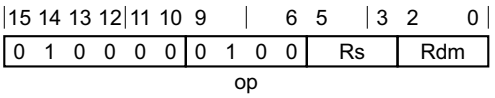
```
ASRS{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

and is always the preferred disassembly.

T1



Arithmetic shift right variant

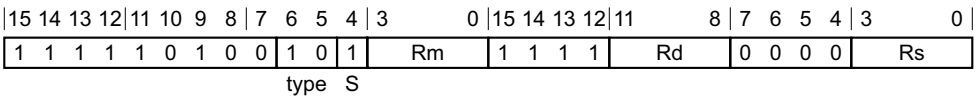
```
ASRS{<q>} {<Rdm>,} <Rdm>, <Rs> // Outside IT block
```

is equivalent to

```
MOVS{<q>} <Rdm>, <Rdm>, ASR <Rs>
```

and is the preferred disassembly when `!InITBlock()`.

T2



Flag setting variant

```
ASRS.W {<Rd>,} <Rm>, <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

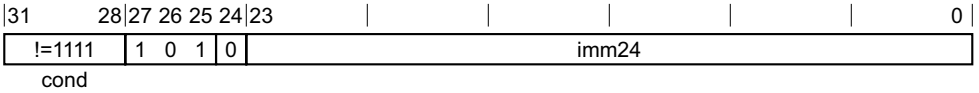
F5.1.18 B

Branch causes a branch to a target address.

A1



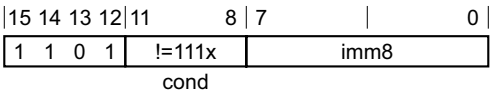
A1 variant

```
B{<c>}{<q>} <label>
```

Decode for this encoding

```
imm32 = SignExtend(imm24:'00', 32);
```

T1



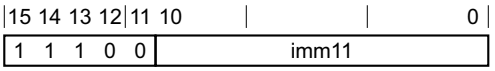
T1 variant

```
B<c>{<q>} <label> // Not permitted in IT block
```

Decode for this encoding

```
if cond == '1110' then SEE UDF;
if cond == '1111' then SEE SVC;
imm32 = SignExtend(imm8:'0', 32);
if InITBlock() then UNPREDICTABLE;
```

T2



T2 variant

```
B{<c>}{<q>} <label> // Outside or last in IT block
```

Decode for this encoding

```
imm32 = SignExtend(imm11:'0', 32);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T3

Non-Confidential - Beta

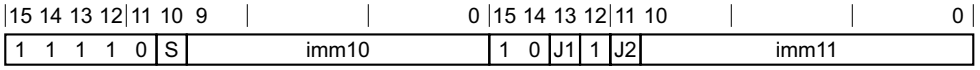
T3 variant

```
B<c>.W <label> // Not permitted in IT block, and <label> can be represented in T1
B<c>{<q>} <label> // Not permitted in IT block
```

Decode for this encoding

```
if cond<3:1> == '111' then SEE "Related encodings";
imm32 = SignExtend(S:J2:J1:imm6:imm11:'0', 32);
if InITBlock() then UNPREDICTABLE;
```

T4



T4 variant

```
B{<c>}.W <label> // <label> can be represented in T2
B{<c>}{<q>} <label>
```

Decode for this encoding

```
I1 = NOT(J1 EOR S);  I2 = NOT(J2 EOR S);  imm32 = SignExtend(S:I1:I2:imm10:imm11:'0', 32);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: Branches and miscellaneous control.

Assembler symbols

<c> For encoding A1, T2 and T4: see *Standard assembler syntax fields* on page F2-2322.

For encoding T1: see *Standard assembler syntax fields* on page F2-2322. Must not be AL or omitted.

For encoding T3: see *Standard assembler syntax fields* on page F2-2322. <c> must not be AL or omitted.

<q> See *Standard assembler syntax fields* on page F2-2322.

<label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are multiples of 4 in the range –33554432 to 33554428.

For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –256 to 254.

For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –2048 to 2046.

For encoding T3: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –1048576 to 1048574.

F5.1.21 BIC, BICS (immediate)

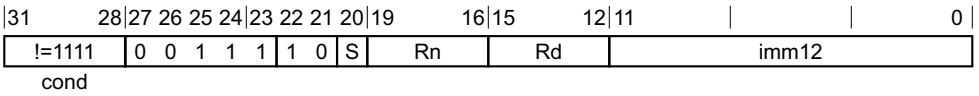
Bitwise Bit Clear (immediate) performs a bitwise AND of a register value and the complement of an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



BIC variant

Applies when S == 0.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

BICS variant

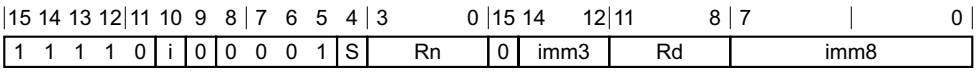
Applies when S == 1.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



BIC variant

Applies when S == 0.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

BICS variant

Applies when S == 1.

F5.1.22 BIC, BICS (register)

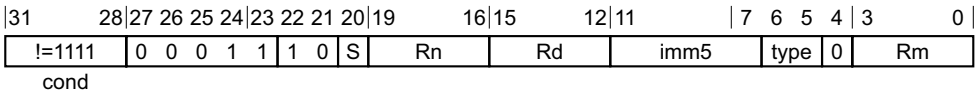
Bitwise Bit Clear (register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



BIC, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

BIC, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

BICS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

BICS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

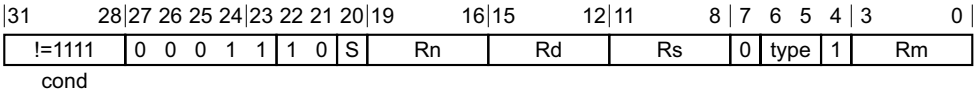
F5.1.23 BIC, BICS (register-shifted register)

Bitwise Bit Clear (register-shifted register) performs a bitwise AND of a register value and the complement of a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Non-Confidential - Beta

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

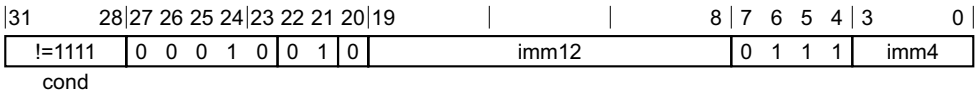
F5.1.24 BKPT

Breakpoint causes a Software Breakpoint Instruction exception.

Breakpoint is always unconditional, even when inside an IT block.

A1



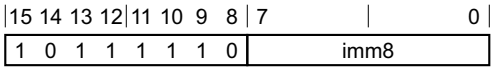
A1 variant

```
BKPT{<q>} {#}<imm>
```

Decode for this encoding

```
imm16 = imm12:imm4;
if cond != '1110' then UNPREDICTABLE;  // BKPT must be encoded with AL condition
```

T1



T1 variant

```
BKPT{<q>} {#}<imm>
```

Decode for this encoding

```
imm16 = ZeroExtend(imm8, 16);
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *BKPT* on page K1-5299.

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2322. An BKPT instruction must be unconditional.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE:

- Records this value in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
- Ignores this value otherwise.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE:

- Records this value in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
- Ignores this value otherwise.

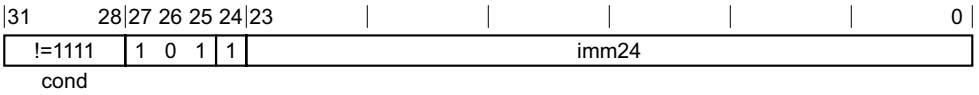
F5.1.25 BL, BLX (immediate)

Branch with Link calls a subroutine at a PC-relative address, and setting LR to the return address.

Branch with Link and Exchange Instruction Sets (immediate) calls a subroutine at a PC-relative address, setting LR to the return address, and changes the instruction set from A32 to T32, or from T32 to A32.

A1



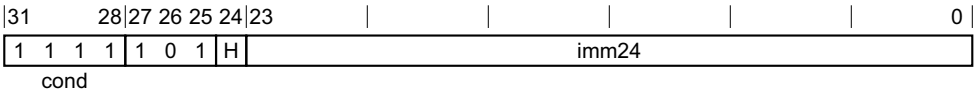
A1 variant

```
BL{<c>}{<q>} <label>
```

Decode for this encoding

```
imm32 = SignExtend(imm24:'00', 32);  targetInstrSet = InstrSet_A32;
```

A2



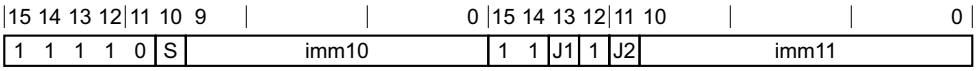
A2 variant

```
BLX{<c>}{<q>} <label>
```

Decode for this encoding

```
imm32 = SignExtend(imm24:H:'0', 32);  targetInstrSet = InstrSet_T32;
```

T1



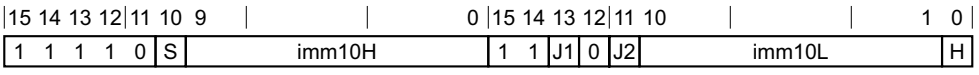
T1 variant

```
BL{<c>}{<q>} <label>
```

Decode for this encoding

```
I1 = NOT(J1 EOR S);  I2 = NOT(J2 EOR S);  imm32 = SignExtend(S:I1:I2:imm10:imm11:'0', 32);
targetInstrSet = InstrSet_T32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T2



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2 variant

```
BLX{<c>}{<q>} <label>
```

Decode for this encoding

```
if H == '1' then UNDEFINED;
I1 = NOT(J1 EOR S);  I2 = NOT(J2 EOR S);  imm32 = SignExtend(S:I1:I2:imm10H:imm10L:'00', 32);
targetInstrSet = InstrSet_A32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322.

For encoding A2: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.

<q> See *Standard assembler syntax fields* on page F2-2322.

<label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are multiples of 4 in the range –33554432 to 33554428.

For encoding A2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are even numbers in the range –33554432 to 33554430.

For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are even numbers in the range –16777216 to 16777214.

For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the Align(PC, 4) value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are multiples of 4 in the range –16777216 to 16777212.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if CurrentInstrSet() == InstrSet_A32 then
        LR = PC - 4;
    else
        LR = PC<31:1> : '1';
    if targetInstrSet == InstrSet_A32 then
        targetAddress = Align(PC,4) + imm32;
    else
        targetAddress = PC + imm32;
    SelectInstrSet(targetInstrSet);
    BranchWritePC(targetAddress);
```

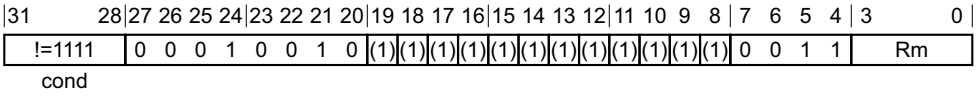
Non-Confidential - Beta

F5.1.26 BLX (register)

Branch with Link and Exchange (register) calls a subroutine at an address specified in the register, and if necessary changes to the instruction set indicated by bit[0] of the register value. If the value in bit[0] is 0, the instruction set after the branch will be A32. If the value in bit[0] is 1, the instruction set after the branch will be T32.

A1



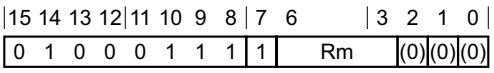
A1 variant

```
BLX{<c>}{<q>} <Rm>
```

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
BLX{<c>}{<q>} <Rm>
```

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The SP can be used, but this is deprecated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    target = R[m];
    if CurrentInstrSet() == InstrSet_A32 then
        next_instr_addr = PC - 4;
        LR = next_instr_addr;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
else
    next_instr_addr = PC - 2;
    LR = next_instr_addr<31:1> : '1';
BXWritePC(target);
```

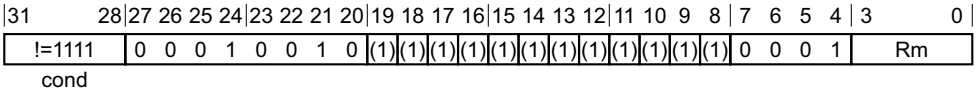
Non-Confidential - Beta

F5.1.27 BX

Branch and Exchange causes a branch to an address and instruction set specified by a register.

A1



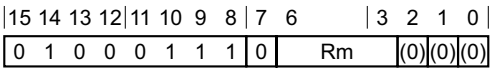
A1 variant

```
BX{<c>}{<q>} <Rm>
```

Decode for this encoding

```
m = UInt(Rm);
```

T1



T1 variant

```
BX{<c>}{<q>} <Rm>
```

Decode for this encoding

```
m = UInt(Rm);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rm> For encoding A1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The SP can be used, but this is deprecated. The PC can be used.

For encoding T1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The SP can be used, but this is deprecated. The PC can be used.

Note

If <Rm> is the PC at a non word-aligned address, it results in UNPREDICTABLE behavior because the address passed to the `BXWritePC()` pseudocode function has bits<1:0> = '10'.

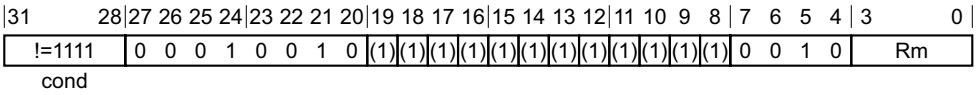
F5.1.28 BXJ

Branch and Exchange, previously Branch and Exchange Jazelle.

In ARMv8, BXJ behaves as a BX instruction, see BX. This means it causes a branch to an address and instruction set specified by a register.

A1



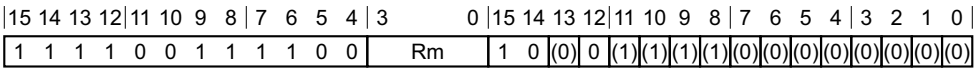
A1 variant

```
BXJ{<c>}{<q>} <Rm>
```

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
BXJ{<c>}{<q>} <Rm>
```

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;  // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

Operation for all encodings

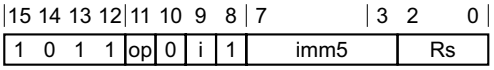
```
if ConditionPassed() then
    EncodingSpecificOperations();
    BXWritePC(R[m]);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.29 CBNZ, CBZ

Compare and Branch on Nonzero and Compare and Branch on Zero compare the value in a register with zero, and conditionally branch forward a constant value. They do not affect the condition flags.

T1



CBNZ variant

Applies when `op == 1`.

```
CBNZ{<q>} <Rn>, <label>
```

CBZ variant

Applies when `op == 0`.

```
CBZ{<q>} <Rn>, <label>
```

Decode for all variants of this encoding

```
n = UInt(Rn);  imm32 = ZeroExtend(i:imm5:'0', 32);  nonzero = (op == '1');
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<Rn>`	Is the general-purpose register to be tested, encoded in the "Rn" field.
`<label>`	Is the program label to be conditionally branched to. Its offset from the PC, a multiple of 2 and in the range 0 to 126, is encoded as "i:imm5" times 4.

Operation

```
EncodingSpecificOperations();
if nonzero != IsZero(R[n]) then
    BranchWritePC(PC + imm32);
```

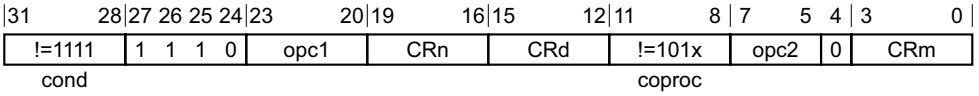
Non-Confidential - Beta

F5.1.30 CDP, CDP2

Coprocessor Data Processing is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the opc1, opc2, CRd, CRn, and CRm field values that are valid CDP and CDP2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

A1



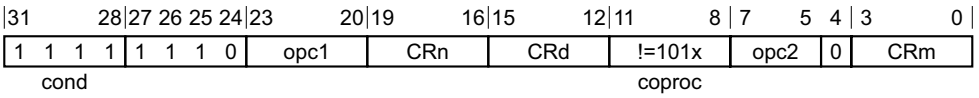
A1 variant

```
CDP{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

A2



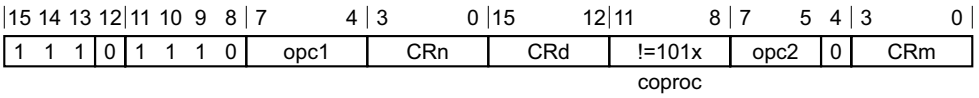
A2 variant

```
CDP2{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

T1



T1 variant

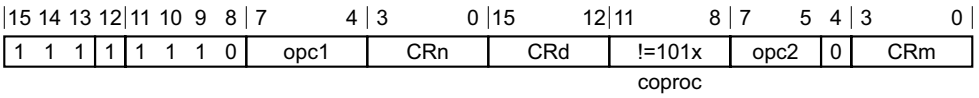
```
CDP{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
CDP2{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

Notes for all encodings

Floating-point instructions: See *Floating-point data-processing* on page F3-2364 for the T32 instruction set, or *Floating-point data-processing* on page F4-2447 for the A32 instruction set.

Assembler symbols

<c>	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<coproc>	Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.
<opc1>	Is a coprocessor-specific opcode, in the range 0 to 15, encoded in the "opc1" field.
<CRd>	Is the destination coprocessor register, encoded in the "CRd" field.
<CRn>	Is the coprocessor register that contains the first operand, encoded in the "CRn" field.
<CRm>	Is the coprocessor register that contains the second operand, encoded in the "CRm" field.
<opc2>	Is a coprocessor-specific opcode in the range 0 to 7, defaulting to 0 and encoded in the "opc2" field.

Operation for all encodings

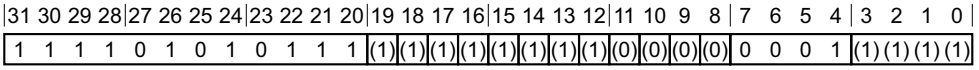
```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    Coproc_InternalOperation(cp, ThisInstr());
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.31 CLREX

Clear-Exclusive clears the local monitor of the executing PE.

A1



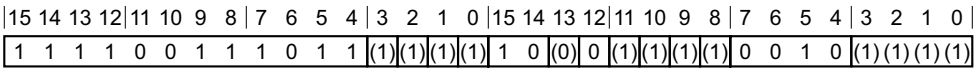
A1 variant

```
CLREX{<c>}{<q>}
```

Decode for this encoding

```
// No additional decoding required
```

T1



T1 variant

```
CLREX{<c>}{<q>}
```

Decode for this encoding

```
// No additional decoding required
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2322. Must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

Operation for all encodings

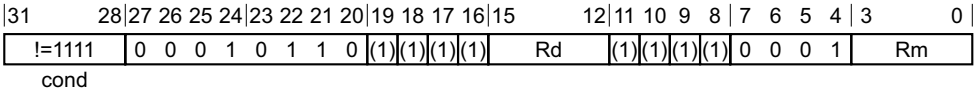
```
if ConditionPassed() then
    EncodingSpecificOperations();
    ClearExclusiveLocal(ProcessorID());
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.32 CLZ

Count Leading Zeros returns the number of binary zero bits before the first binary one bit in a value.

A1



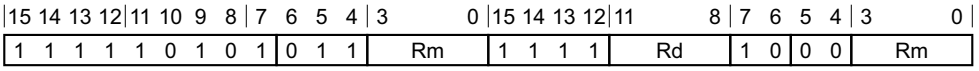
A1 variant

```
CLZ{<c>}{<q>} <Rd>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
CLZ{<c>}{<q>} <Rd>, <Rm>
```

Decode for this encoding

```
if !Consistent(Rm) then UNPREDICTABLE;
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *CLZ* on page K1-5300.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	For encoding A1: is the general-purpose source register, encoded in the "Rm" field. For encoding T1: is the general-purpose source register, encoded in the "Rm" field. Its number must be encoded twice.

Operation for all encodings

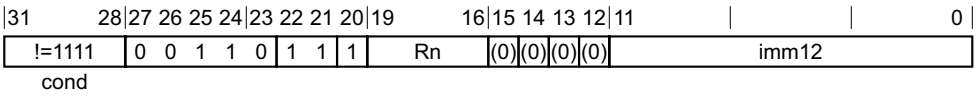
```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.33 CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1



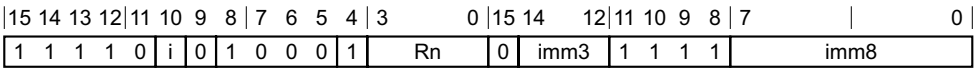
A1 variant

```
CMN{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);  imm32 = A32ExpandImm(imm12);
```

T1



T1 variant

```
CMN{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);  imm32 = T32ExpandImm(i:imm3:imm8);
if n == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, '0');
    PSTATE.<N,Z,C,V> = nzcv;
```

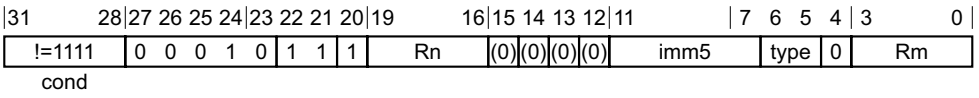
Non-Confidential - Beta

F5.1.34 CMN (register)

Compare Negative (register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



Rotate right with extend variant

Applies when `imm5 == 00000 && type == 11`.

```
CMN{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

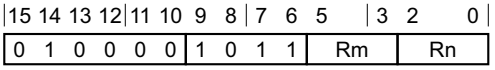
Applies when `!(imm5 == 00000 && type == 11)`.

```
CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1



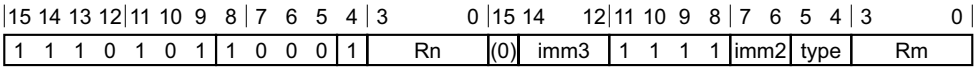
T1 variant

```
CMN{<c>}{<q>} <Rn>, <Rm>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



Rotate right with extend variant

Applies when `imm3 == 000 && imm2 == 00 && type == 11`.

```
CMN{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
CMN{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1
CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcv;
```

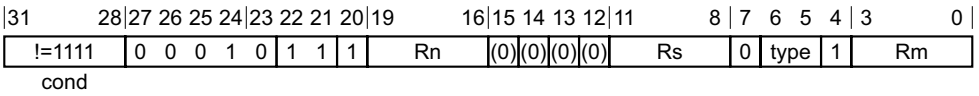
F5.1.35 CMN (register-shifted register)

Compare Negative (register-shifted register) adds a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



A1 variant

```
CMN{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcv;
```

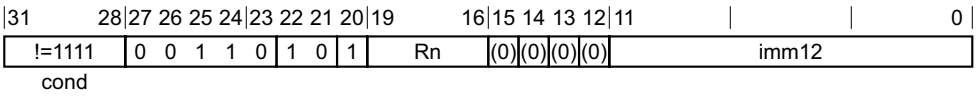
Non-Confidential - Beta

F5.1.36 CMP (immediate)

Compare (immediate) subtracts an immediate value from a register value. It updates the condition flags based on the result, and discards the result.

A1



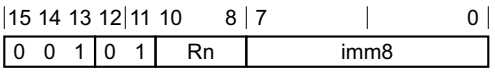
A1 variant

```
CMP{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);  imm32 = A32ExpandImm(imm12);
```

T1



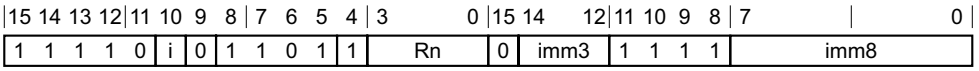
T1 variant

```
CMP{<c>}{<q>} <Rn>, #<imm8>
```

Decode for this encoding

```
n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
```

T2



T2 variant

```
CMP{<c>}.W <Rn>, #<const> // <Rd>, <const> can be represented in T1
CMP{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);  imm32 = T32ExpandImm(i:imm3:imm8);
if n == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is a general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the general-purpose source register, encoded in the "Rn" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

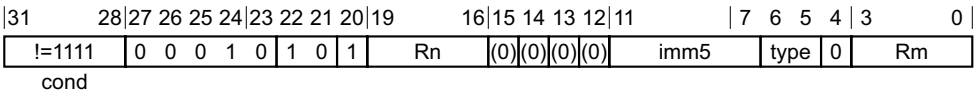
F5.1.37 CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1



Rotate right with extend variant

Applies when `imm5 == 00000 && type == 11`.

```
CMP{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

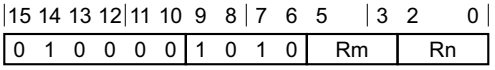
Applies when `!(imm5 == 00000 && type == 11)`.

```
CMP{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1



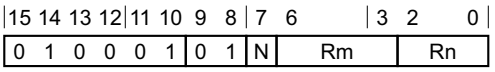
T1 variant

```
CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> both from R0-R7
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



T2 variant

```
CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> not both from R0-R7
```

Decode for this encoding

```
n = UInt(N:Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
if n < 8 && m < 8 then UNPREDICTABLE;
if n == 15 || m == 15 then UNPREDICTABLE;
```

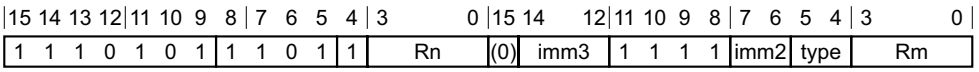
Non-Confidential - Beta

T3



Rotate right with extend variant

Applies when `imm3 == 000 && imm2 == 00 && type == 11`.

```
CMP{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

```
CMP{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1 or T2
CMP{<c>}{<q>} <Rn>, <Rm>, <shift> #<amount>
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *CMP (register)* on page K1-5300.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Non-Confidential - Beta

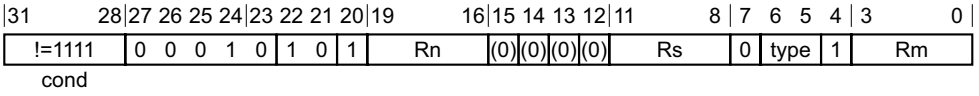
F5.1.38 CMP (register-shifted register)

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1



A1 variant

```
CMP{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

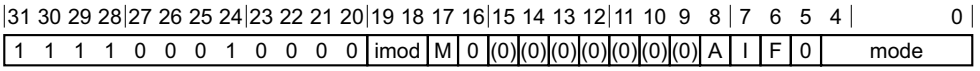
F5.1.39 CPS, CPSID, CPSIE

Change PE State changes one or more of the PSTATE.{A, I, F} interrupt mask bits and, optionally, the PSTATE.M mode field, without changing any other PSTATE bits.

CPS is treated as NOP if executed in User mode unless it is defined as being CONSTRAINED UNPREDICTABLE elsewhere in this section.

The PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3667.

A1



CPS variant

Applies when imod == 00 && M == 1.

```
CPS{<q>} #<mode> // Cannot be conditional
```

CPSID variant

Applies when imod == 11 && M == 0.

```
CPSID{<q>} <iflags> // Cannot be conditional
```

CPSID variant

Applies when imod == 11 && M == 1.

```
CPSID{<q>} <iflags> , #<mode> // Cannot be conditional
```

CPSIE variant

Applies when imod == 10 && M == 0.

```

Non-Confidential - Beta

Notes for all encodings

Hint instructions: In encoding T2, if the `imod` field is `00` and the `M` bit is `0`, a hint instruction is encoded. To determine which hint instruction, see Branches and miscellaneous control.

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *CPS (T32)* on page K1-5345 and *CPS (A32)* on page K1-5344.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<iflags>` Is a sequence of one or more of the following, specifying which interrupt mask bits are affected:

- `a` Sets the A bit in the instruction, causing the specified effect on PSTATE.A, the asynchronous abort mask bit.
- `i` Sets the I bit in the instruction, causing the specified effect on PSTATE.I, the IRQ interrupt mask bit.
- `f` Sets the F bit in the instruction, causing the specified effect on PSTATE.F, the FIQ interrupt mask bit.

`<mode>` Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
        if changemode then
            // WriteMode will set PSTATE.IL if 'mode' is not legal.
            AArch32.WriteMode(mode);
else
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
        if changemode then
            // WriteMode will set PSTATE.IL if 'mode' is not legal.
            AArch32.WriteMode(mode);
```

F5.1.40 CRC32

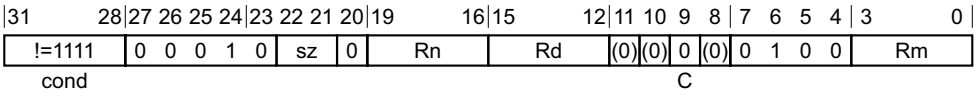
CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

Note

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

A1



CRC32B variant

Applies when sz == 00.

```
CRC32B{<q>} <Rd>, <Rn>, <Rm>
```

CRC32H variant

Applies when sz == 01.

```
CRC32H{<q>} <Rd>, <Rn>, <Rm>
```

CRC32W variant

Applies when sz == 10.

```

F5.1.41 CRC32C

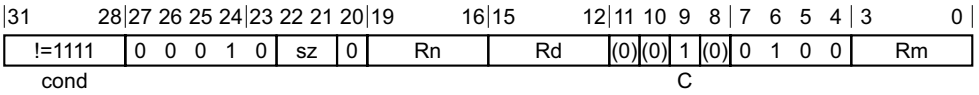
CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

Note

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

A1



CRC32CB variant

Applies when sz == 00.

```
CRC32CB{<q>} <Rd>, <Rn>, <Rm>
```

CRC32CH variant

Applies when sz == 01.

```
CRC32CH{<q>} <Rd>, <Rn>, <Rm>
```

CRC32CW variant

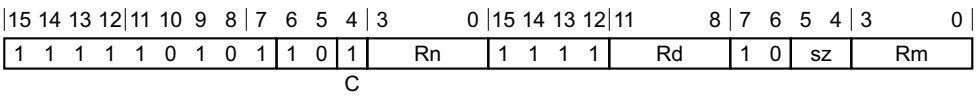
Applies when sz == 10.

```
CRC32CW{<q>} <Rd>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
```

T1



CRC32CB variant

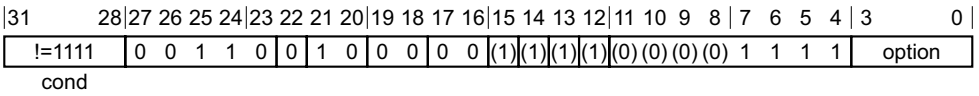
F5.1.42 DBG

Debug Hint provides a hint to debug and related systems. See the system documentation for what use (if any) is made of this instruction.

A1



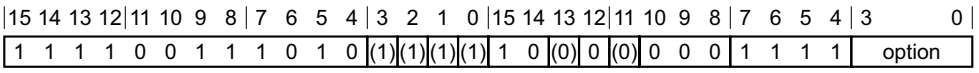
A1 variant

```
DBG{<c>}{<q>} #<option>
```

Decode for this encoding

```
// Any decoding of 'option' is specified by the debug system
```

T1



T1 variant

```
DBG{<c>}{<q>} #<option>
```

Decode for this encoding

```
// Any decoding of 'option' is specified by the debug system
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<option> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Hint_Debug(option);
```

F5.1.43 DCPS1, DCPS2, DCPS3

Debug Change PE State allows the debugger to move the PE into a higher Exception Level or to a specific mode at the current Exception Level.

These instructions are always UNDEFINED in Non-debug state.

`DCPS1` targets EL1 and:

- If EL1 is using AArch32, the PE enters SVC mode. If EL3 is using AArch32, Secure SVC is an EL3 mode. This means `DCPS1` causes the PE to enter EL3.
- If EL1 is using AArch64, the PE enters EL1h, and executes future instructions as A64 instructions.

`DCPS2` targets EL2 and:

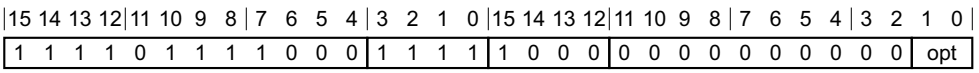
- If EL2 is using AArch32, the PE enters Hyp mode.
- If EL2 is using AArch64, the PE enters EL2h, and executes future instructions as A64 instructions.

`DCPS3` targets EL3 and:

- If EL3 is using AArch32, the PE enters Monitor mode.
- If EL3 is using AArch64, the PE enters EL3h, and executes future instructions as A64 instructions.

For more information on the operation of these instructions, see *DCPS* on page H2-4721.

T1



DCPS1 variant

Applies when `opt == 01`.

`DCPS1`

DCPS2 variant

Applies when `opt == 10`.

`DCPS2`

DCPS3 variant

Applies when `opt == 11`.

`DCPS3`

Decode for all variants of this encoding

```
if !Halted() || opt == '00' then UNDEFINED;
```

Operation

```
DCPSInstruction(opt);
```

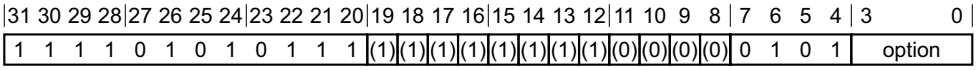
F5.1.44 DMB

Data Memory Barrier is a memory barrier that ensures the ordering of observations of memory accesses, see *Data Memory Barrier (DMB)* on page E2-2252.

A1



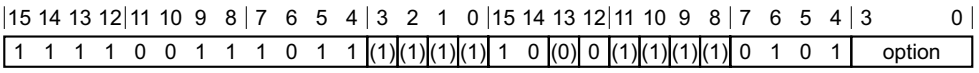
A1 variant

```
DMB{<c>}{<q>} {<option>}
```

Decode for this encoding

```
// No additional decoding required
```

T1



T1 variant

```
DMB{<c>}{<q>} {<option>}
```

Decode for this encoding

```
// No additional decoding required
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2322. Must be `AL` or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<option>` Specifies an optional limitation on the barrier operation. Values are:

- `SY` Full system is the required shareability domain, reads and writes are the required access types in both Group A and Group B. Can be omitted. This option is referred to as the full system DMB. Encoded as option = `0b1111`.
- `ST` Full system is the required shareability domain, writes are the required access type in both Group A and Group B. `SYST` is a synonym for `ST`. Encoded as option = `0b1110`.
- `LD` Full system is the required shareability domain, reads are the required access type in Group A, and reads and writes are the required access types in Group B. Encoded as option = `0b1101`.
- `ISH` Inner Shareable is the required shareability domain, reads and writes are the required access types in both Group A and Group B. Encoded as option = `0b1011`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ISHST — Inner Shareable is the required shareability domain, writes are the required access type in both Group A and Group B. Encoded as option = 0b1010.

ISHLD — Inner Shareable is the required shareability domain, reads are the required access type in Group A, and reads and writes are the required access types in Group B. Encoded as option = 0b1001.

NSH — Non-shareable is the required shareability domain, reads and writes are the required access types in both Group A and Group B. Encoded as option = 0b0111.

NSHST — Non-shareable is the required shareability domain, writes are the required access type in both Group A and Group B. Encoded as option = 0b0110.

NSHLD — Non-shareable is the required shareability domain, reads are the required access type in Group A, and reads and writes are the required access types in Group B. Encoded as option = 0b0101.

OSH — Outer Shareable is the required shareability domain, reads and writes are the required access types in both Group A and Group B. Encoded as option = 0b0011.

OSHST — Outer Shareable is the required shareability domain, writes are the required access type in both Group A and Group B. Encoded as option = 0b0010.

OSHLD — Outer Shareable is the required shareability domain, reads are the required access type in Group A, and reads and writes are the required access types in Group B. Encoded as option = 0b0001.

All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system barrier operation, but software must not rely on this behavior.

Note

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST is an alias for NSHST.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    case option of
        when '0001'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_Reads;
        when '0010'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_Writes;
        when '0011'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_All;
        when '0101'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_Reads;
        when '0110'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_Writes;
        when '0111'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_All;
        when '1001'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_Reads;
        when '1010'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_Writes;
        when '1011'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_All;
        when '1101'  domain = MBReqDomain_FullSystem;      types = MBReqTypes_Reads;
        when '1110'  domain = MBReqDomain_FullSystem;      types = MBReqTypes_Writes;
        otherwise    domain = MBReqDomain_FullSystem;      types = MBReqTypes_All;

    if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1} then
        if HCR.BSU == '11' then
            domain = MBReqDomain_FullSystem;
        if HCR.BSU == '10' && domain != MBReqDomain_FullSystem then
            domain = MBReqDomain_OuterShareable;

F5.1.46 EOR, EORS (immediate)

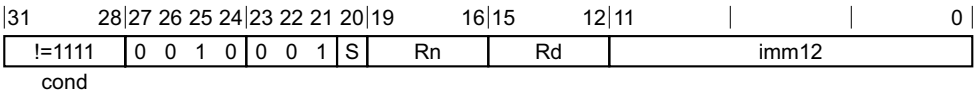
Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



EOR variant

Applies when S == 0.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

EORS variant

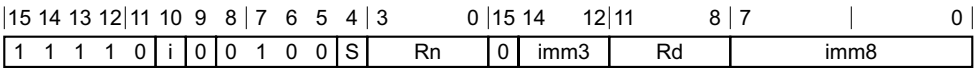
Applies when S == 1.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



EOR variant

Applies when S == 0.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

EORS variant

Applies when S == 1 && Rd != 1111.

Non-Confidential - Beta

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TEQ (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.47 EOR, EORS (register)

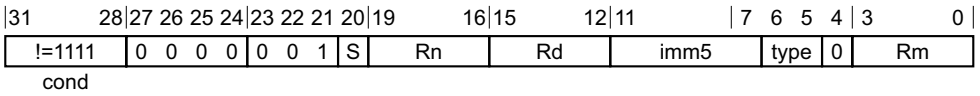
Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



EOR, rotate right with extend variant

Applies when S == 0 && imm5 == 00000 && type == 11.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

EOR, shift or rotate by value variant

Applies when S == 0 && !(imm5 == 00000 && type == 11).

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

EORS, rotate right with extend variant

Applies when S == 1 && imm5 == 00000 && type == 11.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

EORS, shift or rotate by value variant

Applies when S == 1 && !(imm5 == 00000 && type == 11).

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

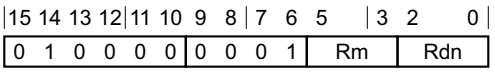
Non-Confidential - Beta

T1



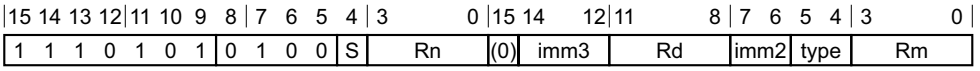
T1 variant

```
EOR<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
EORS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



EOR, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

EOR, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
EOR<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

EORS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11`.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

EORS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
EORS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TEQ (register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential - Beta

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdn>` Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if `EORS <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `EORS <Rd>, <Rn>` had been written
- Inside an IT block, if `EOR<c> <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `EOR<c> <Rd>, <Rn>` had been written.

To prevent either of these happening, use the `.W` qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

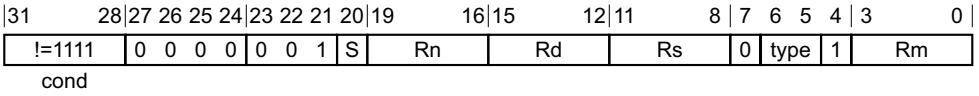
```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.48 EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Non-Confidential - Beta

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Non-Confidential - Beta

F5.1.49 ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores PSTATE from SPSR_<current_mode>.

The register holding the preferred return address is:

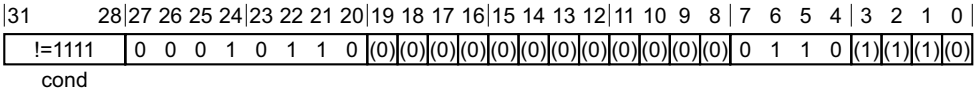
- ELR_hyp, when executing in Hyp mode.
- LR, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.

Exception Return is CONSTRAINED UNPREDICTABLE in User mode and System mode.

In Debug state, the T1 encoding of ERET is decoded as DRPS.

A1



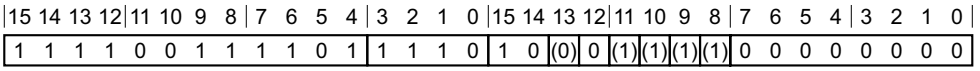
A1 variant

```
ERET{<c>}{<q>}
```

Decode for this encoding

```
// No additional decoding required
```

T1



T1 variant

```
ERET{<c>}{<q>}
```

Decode for this encoding

```
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

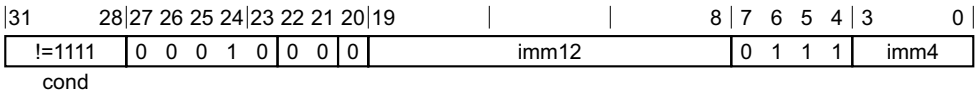
F5.1.50 HLT

Halting breakpoint causes a software breakpoint to occur.

Halting breakpoint is always unconditional, even inside an IT block.

A1



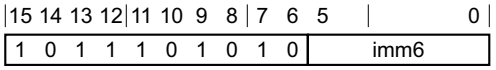
A1 variant

```
HLT{<q>} {#}<imm>
```

Decode for this encoding

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
if cond != '1110' then UNPREDICTABLE; // HLT must be encoded with AL condition
// imm12:imm4 are for assembly/disassembly only and ignored by hardware
```

T1



T1 variant

```
HLT{<q>} {#}<imm>
```

Decode for this encoding

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
// imm6 is for assembly/disassembly only and ignored by hardware
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *HLT* on page K1-5301.

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2322. An HLT instruction must be unconditional.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

Operation for all encodings

```
EncodingSpecificOperations();
Halt(DebugHalt_HaltInstruction);
```

F5.1.51 HVC

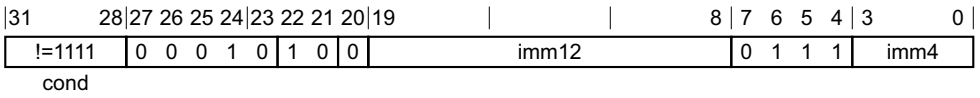
Hypervisor Call causes a Hypervisor Call exception. For more information see *Hypervisor Call (HVC) exception* on page G1-3713. Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is:

- UNDEFINED in Secure state, and in User mode in Non-secure state.
- When SCR.HCE is set to 0, UNDEFINED in Non-secure EL1 modes and CONSTRAINED UNPREDICTABLE in Hyp mode.

On executing an HVC instruction, the HSR reports the exception as a Hypervisor Call exception, using the EC value 0x12, and captures the value of the immediate argument, see *Use of the HSR* on page G4-3989.

A1



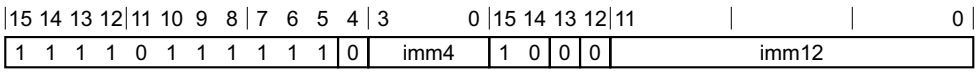
A1 variant

```
HVC{<q>} {#}<imm16>
```

Decode for this encoding

```
if cond != '1110' then UNPREDICTABLE;
imm16 = imm12:imm4;
// imm16 is for assembly/disassembly. It is reported in the HSR but otherwise is ignored by
// hardware. An HVC handler might interpret imm16, for example to determine the required service.
```

T1



T1 variant

```
HVC{<q>} {#}<imm16>
```

Decode for this encoding

```
// imm16 is for assembly/disassembly. It is reported in the HSR but otherwise is ignored by
// hardware. An HVC handler might interpret imm16, for example to determine the required service.
imm16 = imm4:imm12;
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and in particular, *HVC* on page K1-5366.

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2322. An HVC instruction must be unconditional.

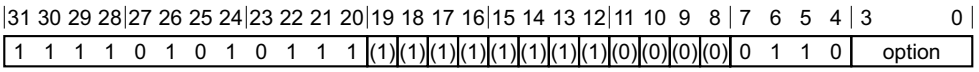
F5.1.52 ISB

Instruction Synchronization Barrier flushes the pipeline in the PE, so that all instructions following the `ISB` are fetched from cache or memory, after the instruction has been completed. It ensures that the effects of context changing operations executed before the `ISB` instruction are visible to the instructions fetched after the `ISB`. Context changing operations include changing the Address Space Identifier (ASID), TLB maintenance instructions, branch predictor maintenance operations, and all changes to the System registers.

In addition, any branches that appear in program order after the `ISB` instruction are written into the branch prediction logic with the context that is visible after the `ISB` instruction. This is needed to ensure correct execution of the instruction stream.

For more information, see *Instruction Synchronization Barrier (ISB)* on page E2-2251.

A1



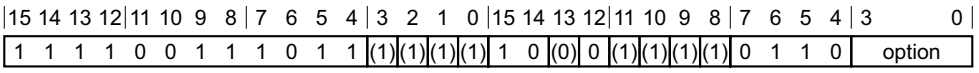
A1 variant

```
ISB{<c>}{<q>} {<option>}
```

Decode for this encoding

```
// No additional decoding required
```

T1



T1 variant

```
ISB{<c>}{<q>} {<option>}
```

Decode for this encoding

```
// No additional decoding required
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2322. Must be `AL` or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<option>` Specifies an optional limitation on the barrier operation. Values are:

`SY` Full system barrier operation, encoded as option = `0b1111`. Can be omitted.

All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

Non-Confidential - Beta

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    InstructionSynchronizationBarrier();
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.53 IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.

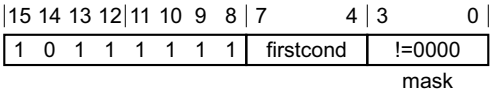
The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores ITSTATE to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

See also *Conditional instructions* on page F1-2285 and *Conditional execution* on page F2-2323.

T1



T1 variant

```
IT{<x>{<y>{<z>}}}{<q>} <cond>
```

Decode for this encoding

```
if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *IT* on page K1-5301.

Related encodings: Miscellaneous 16-bit instructions.

Assembler symbols

<x> The condition for the second instruction in the IT block. If omitted, the "mask" field is set to 0b1000. If present it is encoded in the "mask[3]" field:

- T — firstcond[0]
- E — NOT firstcond[0]

<y> The condition for the third instruction in the IT block. If omitted and <x> is present, the "mask[2:0]" field is set to 0b100. If <y> is present it is encoded in the "mask[2]" field:

- T — firstcond[0]
- E — NOT firstcond[0]

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<z> The condition for the fourth instruction in the IT block. If omitted and <y> is present, the "mask[1:0]" field is set to 0b10. If <z> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:

T firstcond[0]

E NOT firstcond[0]

<q> See *Standard assembler syntax fields* on page F2-2322.

<cond> The condition for the first instruction in the IT block, encoded in the "firstcond" field. See Table F2-1 on page F2-2323 for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See *Conditional instructions* on page F1-2285.

Operation

```
EncodingSpecificOperations();
AArch32.CheckITEnabled(mask);
PSTATE.IT<7:0> = firstcond:mask;
```

F5.1.58 LDAEXD

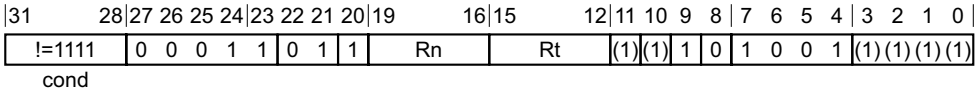
Load-Acquire Exclusive Doubleword loads a doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also acts as a barrier instruction with the ordering requirements described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



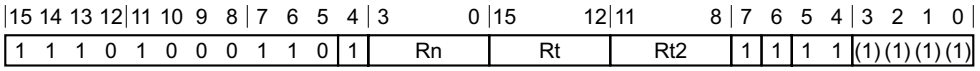
A1 variant

```
LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt);  t2 = t + 1;  n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDAEXD* on page K1-5301.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address, 8);
    value = MemO[address, 8];
    // Extract words from 64-bit loaded value such that R[t] is
    // loaded from address and R[t2] from address+4.
    R[t]  = if BigEndian() then value<63:32> else value<31:0>;
    R[t2] = if BigEndian() then value<31:0>  else value<63:32>;
```

F5.1.61 LDC, LDC2 (immediate)

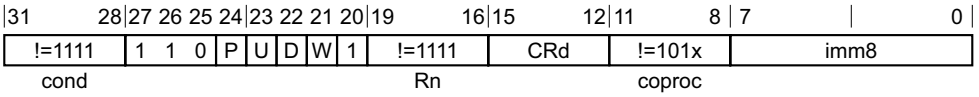
Load Coprocessor (immediate) loads data from consecutive memory addresses to a conceptual coprocessor.

This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `imm8`, `CRd`, and `D` field values that are valid `LDC` and `LDC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

In an implementation that includes EL2, the permitted `LDC` access to a system control register can be trapped to Hyp mode, meaning that an attempt to execute an `LDC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *Trapping general Non-secure System register accesses to debug registers* on page G1-3768.

For simplicity, the `LDC` pseudocode does not show this possible trap to Hyp mode.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>{, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>, #{+/-}<imm>]!
```

Unindexed variant

Applies when `P == 0 && U == 1 && W == 0`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>], <option>
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDC (literal);
if P == '0' && U == '0' && D == '0' && W == '0' then UNDEFINED;
if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
n = UInt(Rn);  cp = UInt(coproc);
imm32 = ZeroExtend(imm8:'00', 32);  index = (P == '1');  add = (U == '1');  wback = (W == '1');
```

<coproc> Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.

<CRd> Is the coprocessor register to be transferred, encoded in the "CRd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see LDC, LDC2 (literal).

<option> Is a coprocessor option, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

<imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    repeat
        Coproc_SendLoadedWord(MemA[address,4], cp, ThisInstr());
        address = address + 4;
    until Coproc_DoneLoading(cp, ThisInstr());
    if wback then R[n] = offset_addr;
```

if coproc == '101x' then UNDEFINED;
index = (P == '1');  add = (U == '1');  cp = UInt(coproc);  imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDC/LDC2 (literal)* on page K1-5302.

Advanced SIMD and floating-point: See *Floating-point and Advanced SIMD load/store and 64-bit register moves* on page F3-2362 for the T32 instruction set, or *Floating-point and Advanced SIMD load/store and 64-bit register moves* on page F4-2445 for the A32 instruction set.

Assembler symbols

`L`	If specified, selects the D == 1 form of the encoding. If omitted, selects the D == 0 form.
`<c>`	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. `<c>` must be `AL` or omitted.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<coproc>` Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.

`<CRd>` Is the coprocessor register to be transferred, encoded in the "CRd" field.

`<option>` Is a coprocessor option, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field.

`<label>` The label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE` (encoded as U == 1). If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE (encoded as U == 0)`.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    address = if index then offset_addr else Align(PC,4);
    repeat
        Coproc_SendLoadedWord(MemA[address,4], cp, ThisInstr());
        address = address + 4;
    until Coproc_DoneLoading(cp, ThisInstr());
```

F5.1.63 LDM, LDMIA, LDMFD

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.

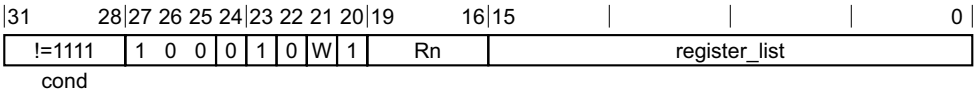
The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Related system instructions are LDM (User registers) and LDM (exception return).

This instruction is used by the alias POP (multiple registers). See the *Alias conditions* on page F5-2614 table for details of when each alias is preferred.

A1



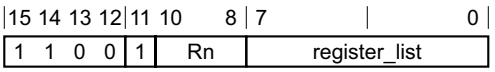
A1 variant

```
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

T1



T1 variant

```
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = '00000000':register_list;  wback = (registers<n> == '0');
if BitCount(registers) < 1 then UNPREDICTABLE;
```

T2

Non-Confidential - Beta

T2 variant

```
LDM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented
in T1
LDMFD{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Full Descending stack, if <Rn>, '!' and
<registers> can be represented in T1
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = P:M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDM/LDMIA/LDMFD (T32)* on page K1-5303 and *LDM/LDMIA/LDMFD (A32)* on page K1-5303.

Alias conditions

Alias	is preferred when
POP (multiple registers)	`W == '1' && Rn == '1101' && BitCount(register_list) > 1`

Assembler symbols

`IA` Is an optional suffix for the Increment After form.

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`!` For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if `<Rn>` is included in `<registers>`, otherwise it must be present.

`<registers>` For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field.

For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Non-Confidential - Beta

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

F5.1.64 LDM (exception return)

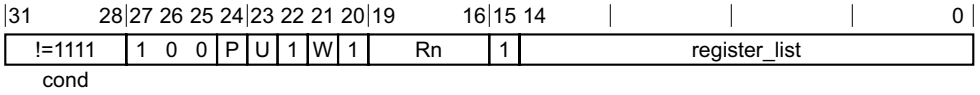
Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The SPSR of the current mode is copied to the CPSR. An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

A1



A1 variant

```
LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers_with_pc>^
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;
wback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDM (exception return)* on page K1-5346.

Assembler symbols

<amode> is one of:

DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
FA	Full Ascending. For this instruction, a synonym for DA.
DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
EA	Empty Ascending. For this instruction, a synonym for DB.
IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
FD	Full Descending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
ED	Empty Descending. For this instruction, a synonym for IB.

<c> See *Standard assembler syntax fields* on page F2-2322.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers_with_pc> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

Instructions with similar syntax but without the PC included in the registers list are described in LDM (User registers).

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;                          // UNDEFINED or NOP
    else
        length = 4*BitCount(registers) + 4;
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;

        for i = 0 to 14
            if registers<i> == '1' then
                R[i] = MemA[address,4];  address = address + 4;
        new_pc_value = MemA[address,4];

        if wback && registers<n> == '0' then R[n] = if increment then R[n]+length else R[n]-length;
        if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;

        AArch32.ExceptionReturn(new_pc_value, SPSR[]);
```

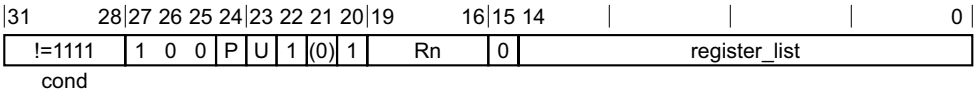
F5.1.65 LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is UNDEFINED in Hyp mode, and UNPREDICTABLE in User and System modes.

A1



A1 variant

```
LDM{<amode>}{<c>}{<q>} <Rn>, <registers_without_pc>^
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  increment = (U == '1');  wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDM (User registers)* on page K1-5346.

Assembler symbols

<amode> is one of:

DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
FA	Full Ascending. For this instruction, a synonym for DA.
DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
EA	Empty Ascending. For this instruction, a synonym for DB.
IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
FD	Full Descending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
ED	Empty Descending. For this instruction, a synonym for IB.

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<registers_without_pc>

Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded by the LDM instruction. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must not be in the register list. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

Instructions with similar syntax but with the PC included in <registers_without_pc> are described in LDM (exception return).

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then  // Load User mode register
                Rmode[i, M32_User] = MemA[address,4];  address = address + 4;
```

Non-Confidential - Beta

F5.1.66 LDMDA, LDMFA

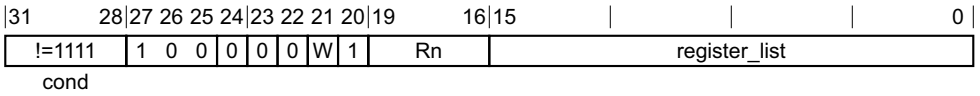
Load Multiple Decrement After (Full Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Related system instructions are LDM (User registers) and LDM (exception return).

A1



A1 variant

```
LDMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDMDA/LDMFA* on page K1-5304.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
```

F5.1.67 LDMDB, LDMEA

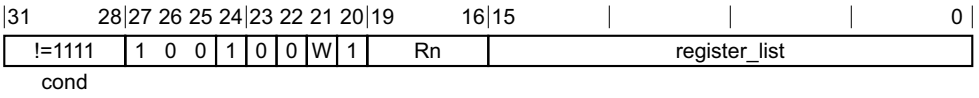
Load Multiple Decrement Before (Empty Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Related system instructions are LDM (User registers) and LDM (exception return).

A1



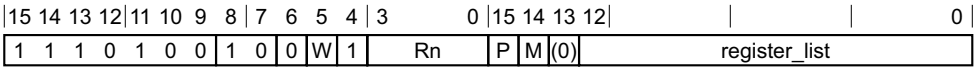
A1 variant

```
LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

T1



T1 variant

```
LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = P:M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDMDB/LDMEA* on page K1-5305.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

Non-Confidential - Beta

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

F5.1.68 LDMIB, LDMED

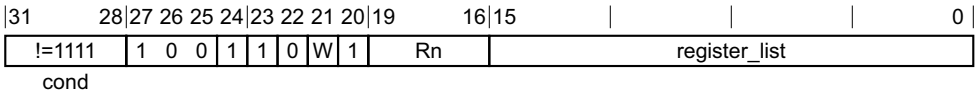
Load Multiple Increment Before (Empty Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Related system instructions are LDM (User registers) and LDM (exception return).

A1



A1 variant

```
LDMIB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDMIB/LDMED* on page K1-5304.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.

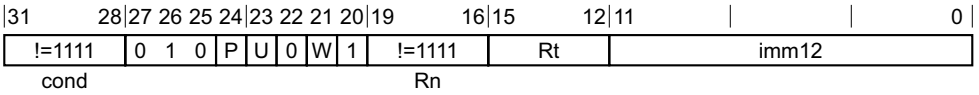
F5.1.69 LDR (immediate)

Load Register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

This instruction is used by the alias POP (single register). See the *Alias conditions* on page F5-2628 table for details of when each alias is preferred.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDR{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

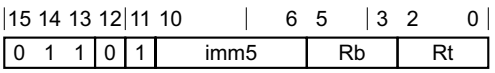
Applies when `P == 1 && W == 1`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDR (literal);
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if wback && n == t then UNPREDICTABLE;
```

T1



T1 variant

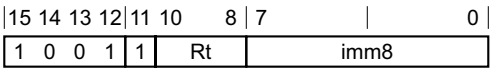
```
LDR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



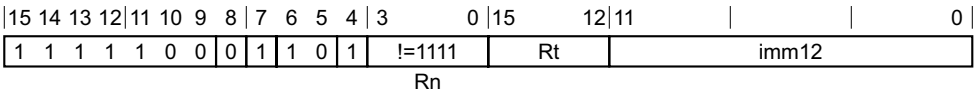
T2 variant

```
LDR{<c>}{<q>} <Rt>, [SP{, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = 13;  imm32 = ZeroExtend(imm8:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T3



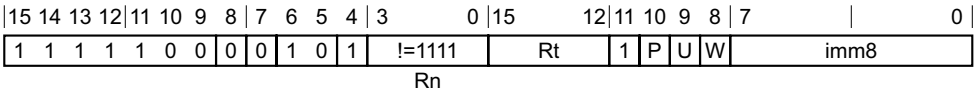
T3 variant

```
LDR{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
LDR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE LDR (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32); index = TRUE;  add = TRUE;
wback = FALSE; if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T4



Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
LDR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDR (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);
imm32 = ZeroExtend(imm8, 32); index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (wback && n == t) || (t == 15 && InITBlock() && !LastInITBlock()) then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDR (immediate, T32)* on page K1-5306 and *LDR (immediate, A32)* on page K1-5306.

Alias conditions

Alias	of variant	is preferred when
POP (single register)	A1 (post-indexed)	`P == '0' && U == '1' && W == '0' && Rn == '1101' && imm12 == '000000000100'`
POP (single register)	T4 (post-indexed)	`Rn == '1101' && U == '1' && imm8 == '00000100'`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

`<Rn>` For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDR (literal).

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1 and T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.

For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
```

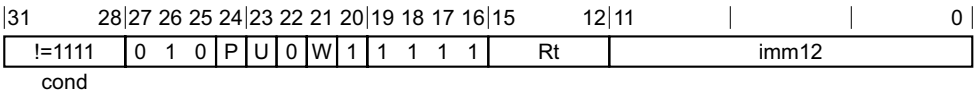
F5.1.70 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



A1 variant

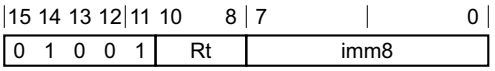
Applies when `!(P == 0 && W == 1)`.

```
LDR{<c>}{<q>} <Rt>, <label> // Normal form
LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if wback then UNPREDICTABLE;
```

T1



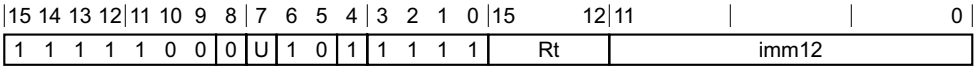
T1 variant

```
LDR{<c>}{<q>} <Rt>, <label> // Normal form
```

Decode for this encoding

```
t = UInt(Rt);  imm32 = ZeroExtend(imm8:'00', 32);  add = TRUE;
```

T2



T2 variant

```
LDR{<c>}.W <Rt>, <label> // Preferred syntax, and <Rt>, <label> can be represented in T1
LDR{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

Decode for this encoding

```
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDR (literal)* on page K1-5306.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

`<label>` For encoding A1 and T2: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,4];
    if t == 15 then
        if address<1:0> == '00' then
            LoadWritePC(data);
        else
            UNPREDICTABLE;
    else
        R[t] = data;
```

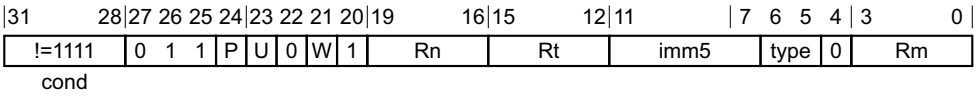
F5.1.71 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see *Memory accesses* on page F2-2327.

The T32 form of LDR (register) does not support register writeback.

A1



Offset variant

Applies when P == 1 && W == 0.

```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed variant

Applies when P == 0 && W == 0.

```
LDR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed variant

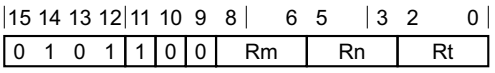
Applies when P == 1 && W == 1.

```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

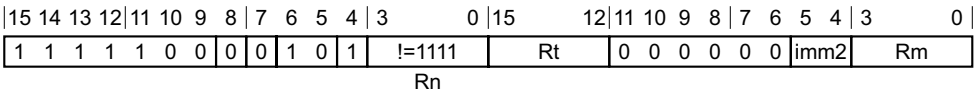
```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
LDR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE LDR (literal);
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDR (register, A32)* on page K1-5307.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This branch is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

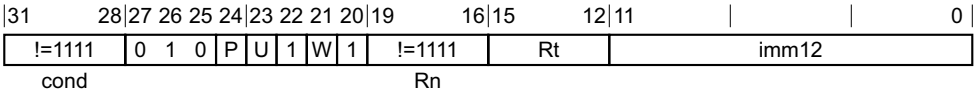
F5.1.72 LDRB (immediate)

Load Register Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

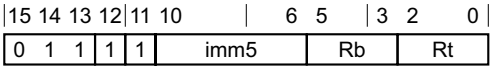
Applies when `P == 1 && W == 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRB (literal);
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

T1



T1 variant

```
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T2

Non-Confidential - Beta

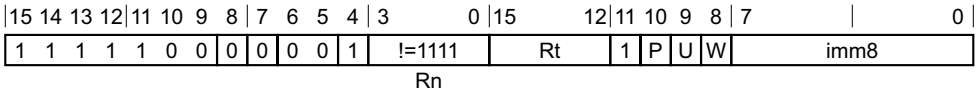
T2 variant

```
LDRB{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rt == '1111' then SEE PLD;
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

T3



Offset variant

Applies when `Rt != 1111 && P == 1 && U == 0 && W == 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLD, PLDW (immediate);
if Rn == '1111' then SEE LDRB (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRBT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if  (t == 15 &&  W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRB (immediate, T32)* on page K1-5307 and *LDRB (immediate, A32)* on page K1-5307.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.

Non-Confidential - Beta

`<Rn>` For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRB (literal).

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        R[t] = ZeroExtend(MemU[address,1], 32);
        if wback then R[n] = offset_addr;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        R[t] = ZeroExtend(MemU[address,1], 32);
        if wback then R[n] = offset_addr;
```

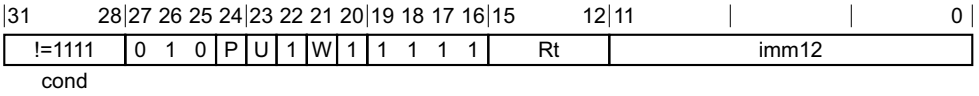
Non-Confidential - Beta

F5.1.73 LDRB (literal)

Load Register Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



A1 variant

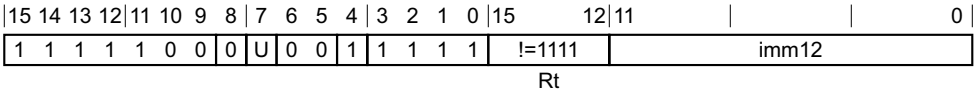
Applies when `!(P == 0 && W == 1)`.

```
LDRB{<c>}{<q>} <Rt>, <label> // Normal form
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

T1



T1 variant

```
LDRB{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

Decode for this encoding

```
if Rt == '1111' then SEE PLD;
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRB (literal)* on page K1-5308.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<label>` The label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = ZeroExtend(MemU[address,1], 32);
```

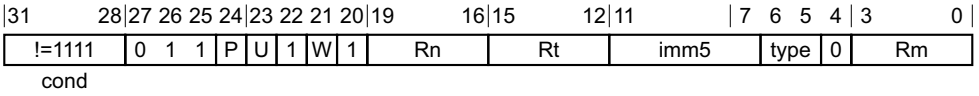
F5.1.74 LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed variant

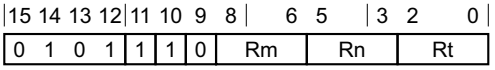
Applies when `P == 1 && W == 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

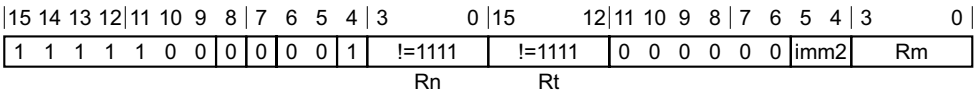
```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
LDRB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rt == '1111' then SEE PLD;
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRB (register)* on page K1-5308.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1],32);
    if wback then R[n] = offset_addr;
```

Non-Confidential - Beta

F5.1.75 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

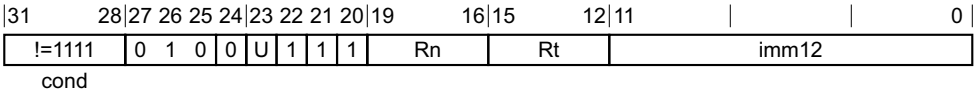
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1



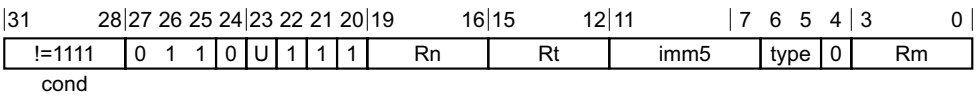
A1 variant

```
LDRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

A2



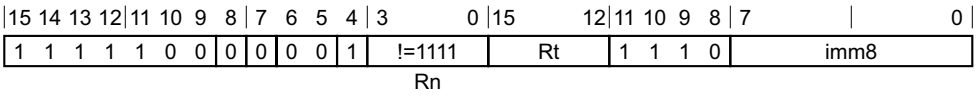
A2 variant

```
LDRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRBT* on page K1-5308.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = ZeroExtend(MemU_unpriv[address,1],32);
    if postindex then R[n] = offset_addr;
```

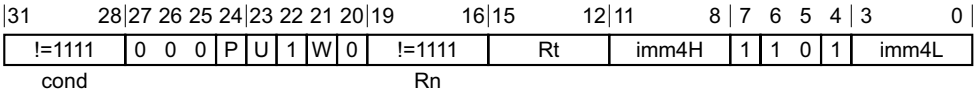
Non-Confidential - Beta

F5.1.76 LDRD (immediate)

Load Register Dual (immediate) calculates an address from a base register value and an immediate offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

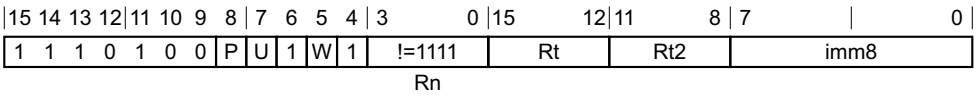
Applies when `P == 1 && W == 1`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRD (literal);
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
```

T1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

if wback && (n == t || n == t2) then UNPREDICTABLE;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRD (immediate)* on page K1-5309.

Related encodings: Load/store dual, load/store exclusive, table branch.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRD (literal).

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian()  then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
    if wback then R[n] = offset_addr;
```

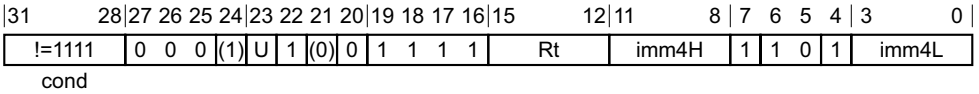
F5.1.77 LDRD (literal)

Load Register Dual (literal) calculates an address from the PC value and an immediate offset, loads two words from memory, and writes them to two registers. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



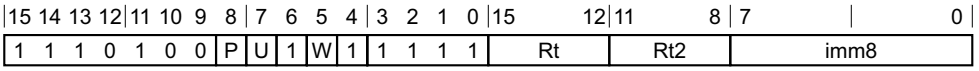
A1 variant

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  imm32 = ZeroExtend(imm4H:imm4L, 32);  add = (U == '1');
if t2 == 15 then UNPREDICTABLE;
```

T1



T1 variant

Applies when `!(P == 0 && W == 0)`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt);  t2 = UInt(Rt2);
imm32 = ZeroExtend(imm8:'00', 32);  add = (U == '1');
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if W == '1' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRD (literal)* on page K1-5310.

Related encodings: Load/store dual, load/store exclusive, table branch.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<label>` For encoding A1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
```

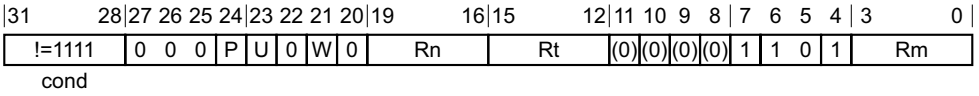
F5.1.78 LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!
```

Decode for all variants of this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 || m == t || m == t2 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRD (register)* on page K1-5310.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

`<Rt2>` Is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];

    if wback then R[n] = offset_addr;
```

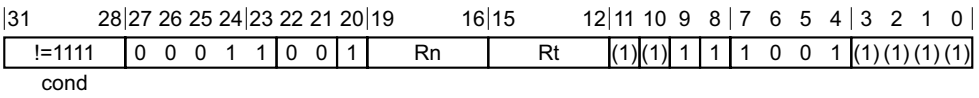
F5.1.79 LDREX

Load Register Exclusive calculates an address from a base register value and an immediate offset, loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



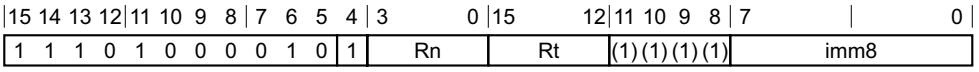
A1 variant

```
LDREX{<c>}{<q>} <Rt>, [<Rn> {, {#}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if t == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDREX{<c>}{<q>} <Rt>, [<Rn> {, #<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDREX* on page K1-5311.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
<imm>	For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    AArch32.SetExclusiveMonitors(address,4);
    R[t] = MemA[address,4];
```

Non-Confidential - Beta

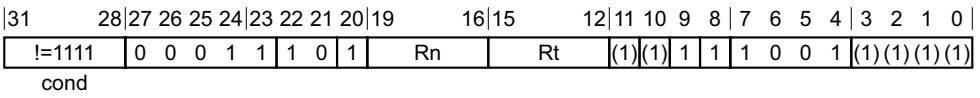
F5.1.80 LDREXB

Load Register Exclusive Byte derives an address from a base register value, loads a byte from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



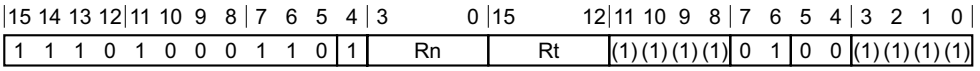
A1 variant

```
LDREXB{<c>}{<q>} <Rt>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDREXB{<c>}{<q>} <Rt>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDREXB* on page K1-5311.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.

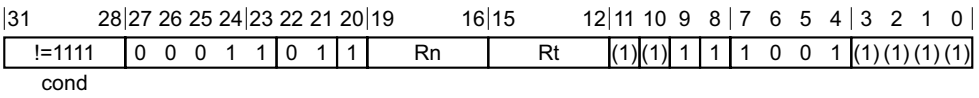
F5.1.81 LDREXD

Load Register Exclusive Doubleword derives an address from a base register value, loads a 64-bit doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



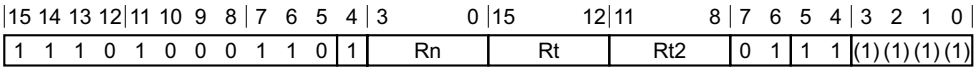
A1 variant

```
LDREXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt);  t2 = t + 1;  n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDREXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDREXD* on page K1-5312.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

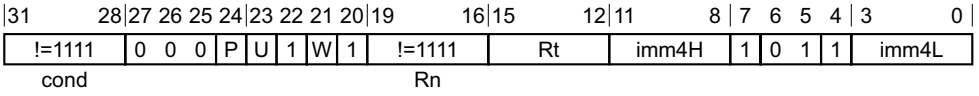
F5.1.83 LDRH (immediate)

Load Register Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

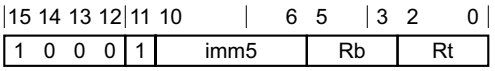
Applies when `P == 1 && W == 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRH (literal);
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

T1



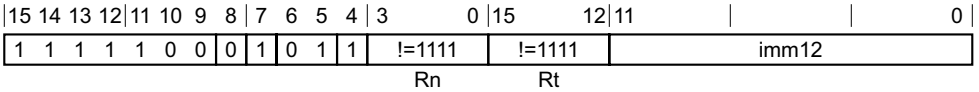
T1 variant

```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'0', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T2



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

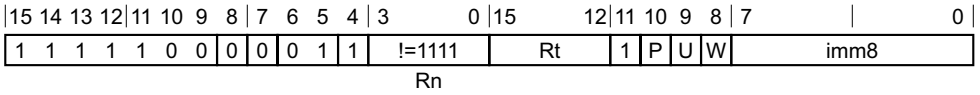
T2 variant

```
LDRH{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rt == '1111' then SEE PLD (immediate);
if Rn == '1111' then SEE LDRH (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

T3



Offset variant

Applies when `Rt != 1111 && P == 1 && U == 0 && W == 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRH (literal);
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLDW (immediate);
if P == '1' && U == '1' && W == '0' then SEE LDRHT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRH (immediate, T32)* on page K1-5313 and *LDRH (immediate, A32)* on page K1-5312.

Non-Confidential - Beta

`<Rn>` For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRH (literal).

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,2];
        if wback then R[n] = offset_addr;
        R[t] = ZeroExtend(data, 32);
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,2];
        if wback then R[n] = offset_addr;
        R[t] = ZeroExtend(data, 32);
```

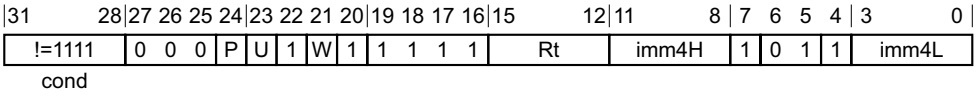
F5.1.84 LDRH (literal)

Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



A1 variant

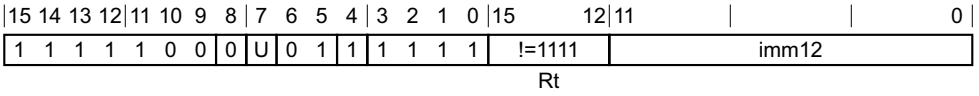
Applies when `!(P == 0 && W == 1)`.

```
LDRH{<c>}{<q>} <Rt>, <label> // Normal form
LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt);  imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

T1



T1 variant

```
LDRH{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

Decode for this encoding

```
if Rt == '1111' then SEE PLD (literal);
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRH (literal)* on page K1-5313.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

Non-Confidential - Beta

`<label>` For encoding A1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = ZeroExtend(data, 32);
```

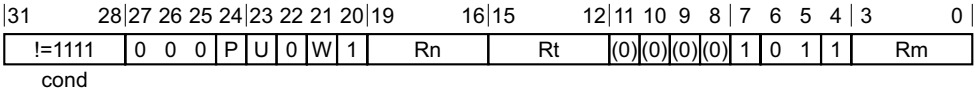
Non-Confidential - Beta

F5.1.85 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

Pre-indexed variant

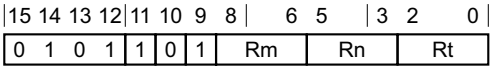
Applies when `P == 1 && W == 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRType_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

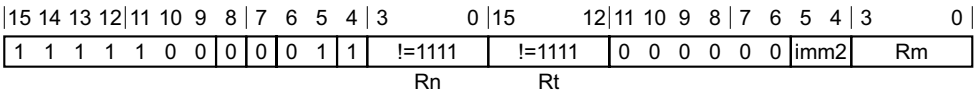
```
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
LDRH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE LDRH (literal);
if Rt == '1111' then SEE PLDW (register);
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRH (register)* on page K1-5313.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
```

Non-Confidential - Beta

F5.1.86 LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

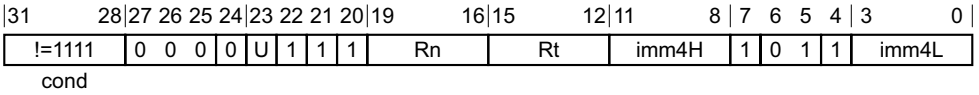
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1



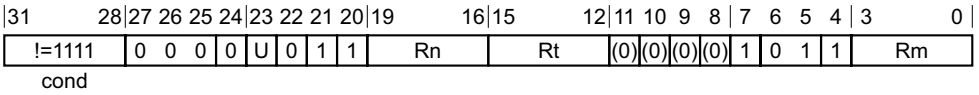
A1 variant

```
LDRHT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

A2



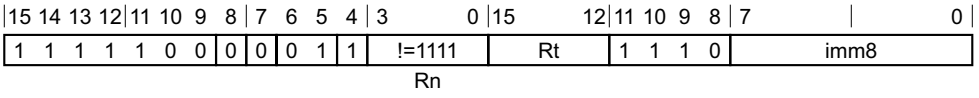
A2 variant

```
LDRHT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDRHT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then SEE LDRH (literal);
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRHT* on page K1-5314.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,2];
    if postindex then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
```

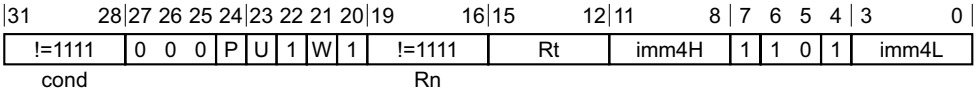
F5.1.87 LDRSB (immediate)

Load Register Signed Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

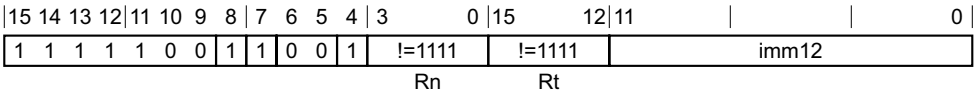
Applies when `P == 1 && W == 1`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRSB (literal);
if P == '0' && W == '1' then SEE LDRSBT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

T1



T1 variant

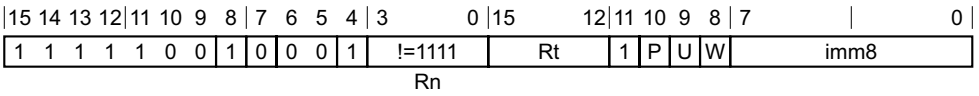
```
LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rt == '1111' then SEE PLI;
if Rn == '1111' then SEE LDRSB (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLI;
if Rn == '1111' then SEE LDRSB (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRSBT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRSB (immediate)* on page K1-5314.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<Rt>`	Is the general-purpose register to be transferred, encoded in the "Rt" field.
`<Rn>`	Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSB (literal).

`+/-`	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
	`-` when `U = 0`
	`+` when `U = 1`

`+`	Specifies the offset is added to the base register.
`<imm>`	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRSB (register)* on page K1-5315.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<Rt>`	Is the general-purpose register to be transferred, encoded in the "Rt" field.
`<Rn>`	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-`	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
	`-` when `U = 0`
	`+` when `U = 1`

`+`	Specifies the index register is added to the base register.
`<Rm>`	Is the general-purpose index register, encoded in the "Rm" field.
`<imm>`	If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = SignExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
```

F5.1.90 LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

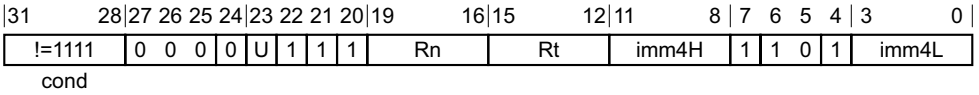
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1



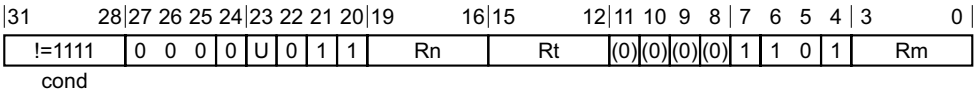
A1 variant

```
LDRSBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

A2



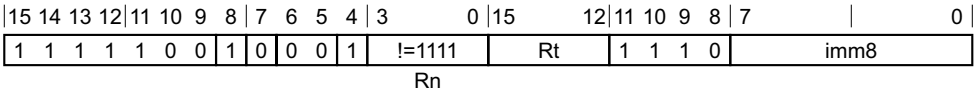
A2 variant

```
LDRSBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
LDRSBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then SEE LDRSB (literal);
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRSBT* on page K1-5315.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = SignExtend(MemU_unpriv[address,1], 32);
    if postindex then R[n] = offset_addr;
```

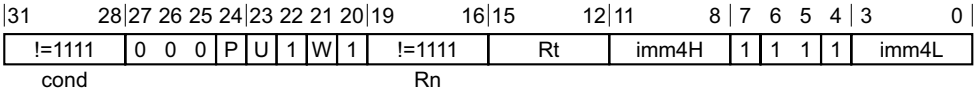
F5.1.91 LDRSH (immediate)

Load Register Signed Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

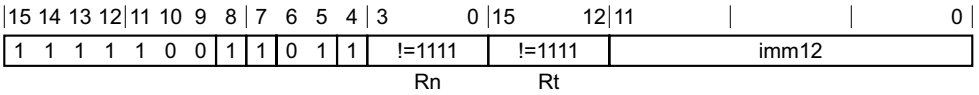
Applies when `P == 1 && W == 1`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRSH (literal);
if P == '0' && W == '1' then SEE LDRSHT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

T1



T1 variant

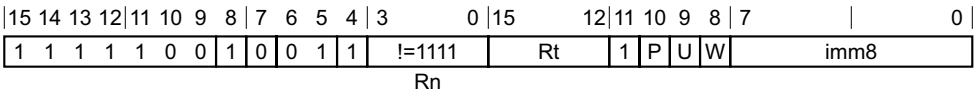
```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "Related instructions";
if P == '1' && U == '1' && W == '0' then SEE LDRSHT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRSH (immediate)* on page K1-5315.

Related instructions: Load/store single.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<Rt>`	Is the general-purpose register to be transferred, encoded in the "Rt" field.
`<Rn>`	Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSH (literal).

`+/-`	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
	`-` when `U = 0`
	`+` when `U = 1`

`+`	Specifies the offset is added to the base register.
`<imm>`	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

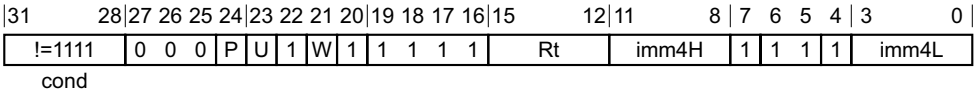
F5.1.92 LDRSH (literal)

Load Register Signed Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



A1 variant

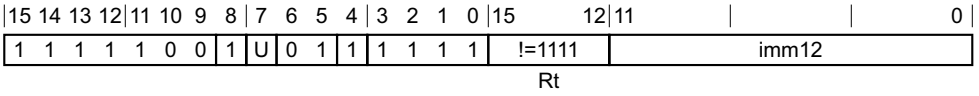
Applies when `!(P == 0 && W == 1)`.

```
LDRSH{<c>}{<q>} <Rt>, <label> // Normal form
LDRSH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRSHT;
t = UInt(Rt);  imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

T1



T1 variant

```
LDRSH{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRSH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

Decode for this encoding

```
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRSH (literal)* on page K1-5316*SBZ or SBO fields in instructions* on page K1-5292.

Related instructions: Load literal.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.

Non-Confidential - Beta

`<label>` For encoding A1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = SignExtend(data, 32);
```

Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then SEE LDR (literal);
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDRT* on page K1-5317.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,4];
    if postindex then R[n] = offset_addr;
    R[t] = data;
```

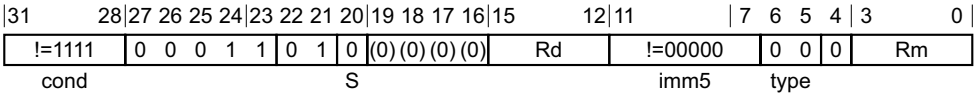
F5.1.96 LSL (immediate)

Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOV, shift or rotate by value variant

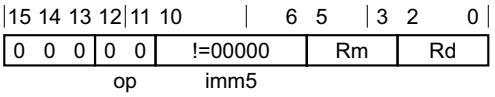
```
LSL{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

T2



T2 variant

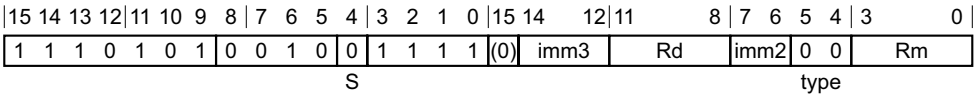
```
LSL<c>{<q>} {<Rd>,} <Rm>, #<imm> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is the preferred disassembly when `InITBlock()`.

T3



MOV, shift or rotate by value variant

```
LSL<c>.W {<Rd>,} <Rm>, #<imm> // Inside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

```
LSL{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 31, encoded in the "imm5" field.

For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

Operation for all encodings

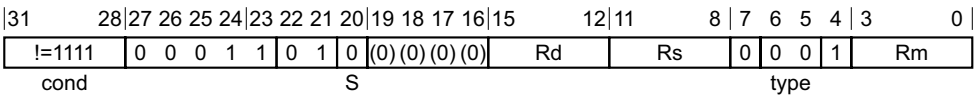
F5.1.97 LSL (register)

Logical Shift Left (register) shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

A1



Not flag setting variant

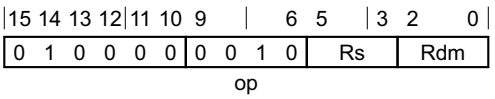
```
LSL{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL <Rs>
```

and is always the preferred disassembly.

T1



Logical shift left variant

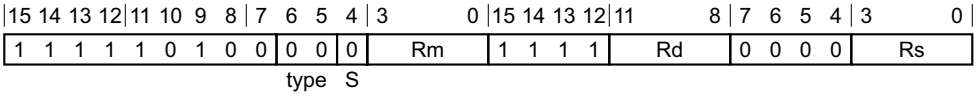
```
LSL<c>{<q>} {<Rdm>,} <Rdm>, <Rs> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs>
```

and is the preferred disassembly when `InITBlock()`.

T2



Not flag setting variant

```
LSL<c>.W {<Rd>,} <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL <Rs>
```

and is always the preferred disassembly.

F5.1.98 LSLS (immediate)

Logical Shift Left, setting flags (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

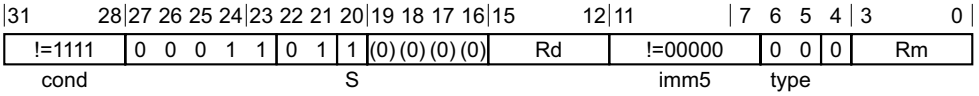
The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOVS, shift or rotate by value variant

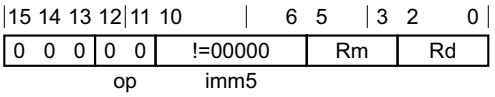
```
LSLS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

T2



T2 variant

```
LSLS{<q>} {<Rd>,} <Rm>, #<imm> // Outside IT block
```

is equivalent to

```
MOVS{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is the preferred disassembly when `!InITBlock()`.

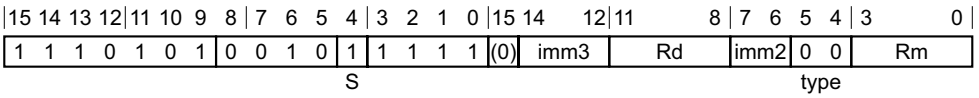
Non-Confidential - Beta

T3



MOVS, shift or rotate by value variant

```
LSLS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

```
LSLS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 31, encoded in the "imm5" field.

For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

F5.1.102 LSRS (immediate)

Logical Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

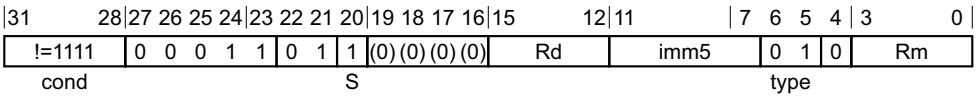
The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOVS, shift or rotate by value variant

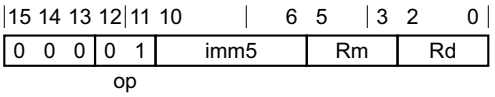
```
LSRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is always the preferred disassembly.

T2



T2 variant

```
LSRS{<q>} {<Rd>,} <Rm>, #<imm> // Outside IT block
```

is equivalent to

```
MOVS{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is the preferred disassembly when `!InITBlock()`.

F5.1.104 MCR, MCR2

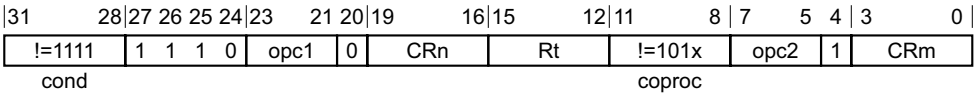
Move to Coprocessor from general-purpose register passes the value of a general-purpose register to a conceptual coprocessor.

This is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the opc1, opc2, CRn, and CRd field values that are valid MCR and MCR2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

In an implementation that includes EL2, MCR accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *EL2 configurable controls* on page G1-3751.

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

A1



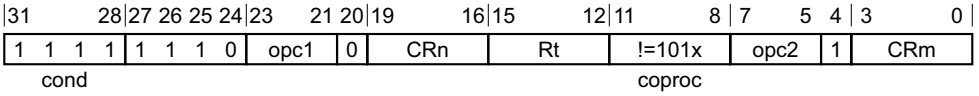
A1 variant

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  cp = UInt(coproc);
if t == 15  then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

A2



A2 variant

```
MCR2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

Decode for this encoding

t = UInt(Rt);  cp = UInt(coproc);
if t == 15  then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Advanced SIMD and floating-point: See *Floating-point and Advanced SIMD 32-bit register moves* on page F3-2367 for the T32 instruction set, or *Floating-point and Advanced SIMD 32-bit register moves* on page F4-2451 for the A32 instruction set.

Assembler symbols

<c>	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<coproc>	Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.
<opc1>	Is a coprocessor-specific opcode in the range 0 to 7, encoded in the "opc1" field.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<CRn>	Is the first coprocessor register, encoded in the "CRn" field.
<CRm>	Is the second coprocessor register, encoded in the "CRm" field.
<opc2>	Is a coprocessor-specific opcode in the range 0 to 7, defaulting to 0 and encoded in the "opc2" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    Coproc_SendOneWord(R[t], cp, ThisInstr());
```

Non-Confidential - Beta

F5.1.105 MCRR, MCRR2

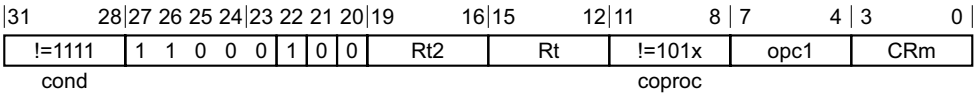
Move to Coprocessor from two general-purpose registers passes the values of two general-purpose registers to a conceptual coprocessor.

This is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the opc1, and CRm field values that are valid MCRR and MCRR2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

In an implementation that includes EL2, MCRR accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *EL2 configurable controls* on page G1-3751.

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

A1



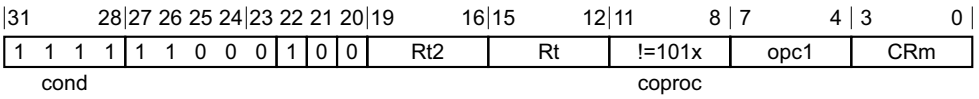
A1 variant

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

A2



A2 variant

```
MCRR2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

T1

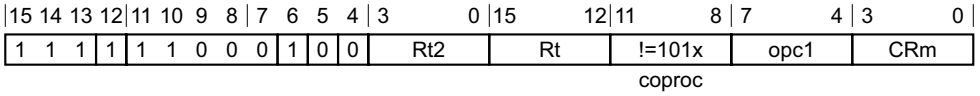
T1 variant

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

T2



T2 variant

```
MCRR2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Advanced SIMD and floating-point: See *Advanced SIMD and floating-point 64-bit move* on page F3-2363 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-2446 for the A32 instruction set.

Assembler symbols

<c>	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<coproc>	Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.
<opc1>	Is a coprocessor-specific opcode in the range 0 to 15, encoded in the "opc1" field.
<Rt>	Is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	Is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<CRm>	Is a coprocessor register, encoded in the "CRm" field.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected coprocessor register, while <Rt> transfers bits[31:0].

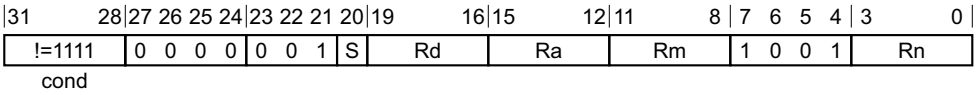
F5.1.106 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1



Flag setting variant

Applies when `S == 1`.

```
MLAS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Not flag setting variant

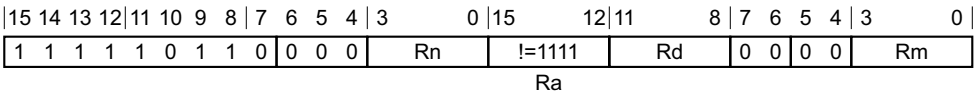
Applies when `S == 0`.

```
MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  setflags = (S == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for this encoding

```
if Ra == '1111' then SEE MUL;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  setflags = FALSE;
if d == 15 || n == 15 || m  == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
    addend   = SInt(R[a]);  // addend   = UInt(R[a]) produces the same final results
    result = operand1 * operand2 + addend;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
```

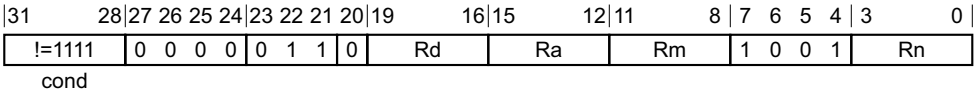
Non-Confidential - Beta

F5.1.107 MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

A1



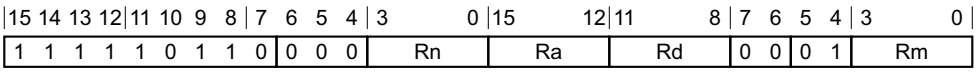
A1 variant

```
MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

F5.1.108 MOV, MOVS (immediate)

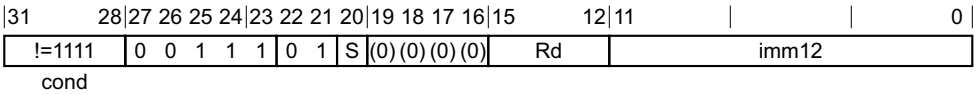
Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



MOV variant

Applies when S == 0.

```
MOV{<c>}{<q>} <Rd>, #<const>
```

MOVS variant

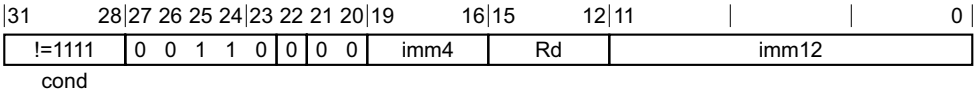
Applies when S == 1.

```
MOVS{<c>}{<q>} <Rd>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');  (imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

A2



A2 variant

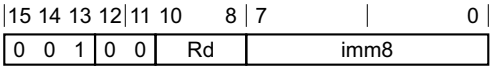
```
MOV{<c>}{<q>} <Rd>, #<imm16> // <imm16> can not be represented in A1
MOVW{<c>}{<q>} <Rd>, #<imm16> // <imm16> can be represented in A1
```

Decode for this encoding

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(imm4:imm12, 32);
if d == 15 then UNPREDICTABLE;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T1



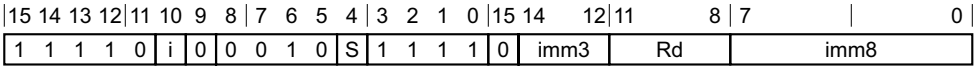
T1 variant

```
MOV<c>{<q>} <Rd>, #<imm8> // Inside IT block
MOVS{<q>} <Rd>, #<imm8> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);  carry = PSTATE.C;
```

T2



MOV variant

Applies when `S == 0`.

```
MOV<c>.W <Rd>, #<const> // Inside IT block, and <Rd>, <const> can be represented in T1
MOV{<c>}{<q>} <Rd>, #<const>
```

MOVS variant

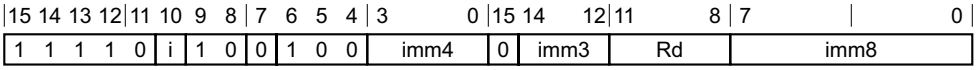
Applies when `S == 1`.

```
MOVS.W <Rd>, #<const> // Outside IT block, and <Rd>, <const> can be represented in T1
MOVS{<c>}{<q>} <Rd>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');  (imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T3



T3 variant

```
MOV{<c>}{<q>} <Rd>, #<imm16> // <imm16> cannot be represented in T1 or T2
MOVW{<c>}{<q>} <Rd>, #<imm16> // <imm16> can be represented in T1 or T2
```

Decode for this encoding

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(imm4:i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding A2, T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<imm16> For encoding A2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.

For encoding T3: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = imm32;
    if d == 15 then          // Can only occur for encoding A1
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.109 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

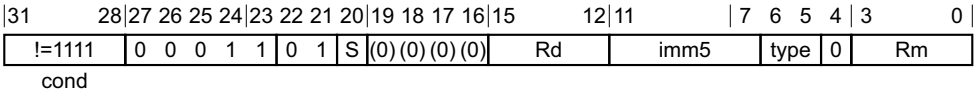
If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases ASRS (immediate), ASR (immediate), LSLS (immediate), LSL (immediate), LSRS (immediate), LSR (immediate), RORS (immediate), ROR (immediate), RRXS, and RRX. See the *Alias conditions* on page F5-2717 table for details of when each alias is preferred.

A1



MOV, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOV, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MOVS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOVS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

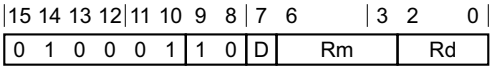
```
MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T1



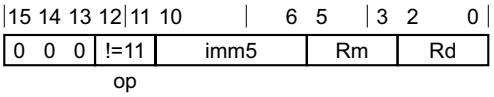
T1 variant

```
MOV{<c>}{<q>} <Rd>, <Rm>
```

Decode for this encoding

```
d = UInt(D:Rd);  m = UInt(Rm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T2



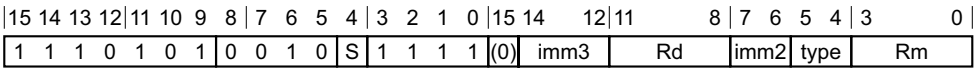
T2 variant

```
MOV<c>{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block
MOVS{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = TRUE;
(shift_t, shift_n) = DecodeImmShift(op, imm5);
if op == '00' && imm5 == '00000' && InITBlock() then UNPREDICTABLE;
```

T3



MOV, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOV, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
MOV<c>.W <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block, and <Rd>, <Rm>, <shift>, <amount> can be
represented in T1 or T2
MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MOVS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && imm2 == 00 && type == 11`.

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

MOVS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
MOVS.W <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block, and <Rd>, <Rm>, <shift>, <amount> can be
represented in T1 or T2
MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *MOV (register, T32)* on page K1-5317.

Alias conditions

Alias	of variant	is preferred when
ASRS (immediate)	T3 (MOVS, shift or rotate by value), A1 (MOVS, shift or rotate by value)	`S == '1' && type == '10'`
ASRS (immediate)	T2	`op == '10' && !InITBlock()`

Non-Confidential - Beta

Alias	of variant	is preferred when
RRXS	A1 (MOVS, rotate right with extend)	`S == '1' && imm5 == '00000' && type == '11'`
RRX	T3 (MOV, rotate right with extend)	`S == '0' && imm3 == '000' && imm2 == '00' && type == '11'`
RRX	A1 (MOV, rotate right with extend)	`S == '0' && imm5 == '00000' && type == '11'`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of the instruction if <Rn> is not the LR, or if the optional shift or `RRX` argument is specified.

For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:

- The instruction causes a branch to the address moved to the PC. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The instruction must either be outside an IT block or the last instruction of an IT block.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<shift>` For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

`ROR` when `type = 11`

For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:

`LSL` when `op = 00`

`LSR` when `op = 01`

`ASR` when `op = 10`

`<amount>` For encoding A1 and T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = shifted;
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

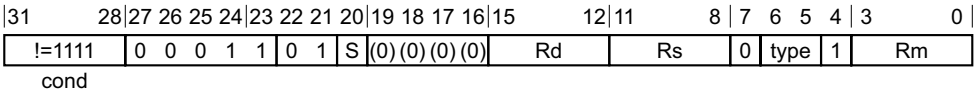
F5.1.110 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases ASRS (register), ASR (register), LSLS (register), LSL (register), LSRS (register), LSR (register), RORS (register), and ROR (register). See the *Alias conditions* on page F5-2722 table for details of when each alias is preferred.

A1



Flag setting variant

Applies when `S == 1`.

```
MOVS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Not flag setting variant

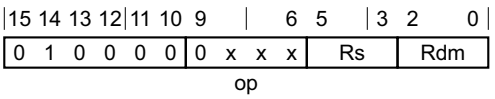
Applies when `S == 0`.

```
MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

T1



Arithmetic shift right variant

Applies when `op == 0100`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, ASR <Rs> // Outside IT block
```

Logical shift left variant

Applies when `op == 0010`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, LSL <Rs> // Outside IT block
```

Logical shift right variant

Applies when `op == 0011`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, LSR <Rs> // Outside IT block
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Rotate right variant

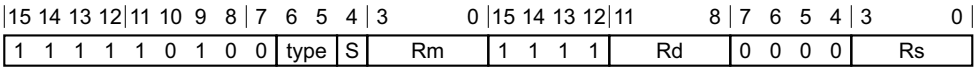
Applies when op == 0111.

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, ROR <Rs> // Outside IT block
```

Decode for all variants of this encoding

```
if !(op IN {'0010', '0011', '0100', '0111'}) then SEE "Related encodings";
d = UInt(Rdm);  m = UInt(Rdm);  s = UInt(Rs);
setflags = !InITBlock();  shift_t = DecodeRegShift(op<2>:op<0>);
```

T2



Flag setting variant

Applies when S == 1.

```
MOVS.W <Rd>, <Rm>, <type> <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
MOVS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when S == 0.

```
MOV<c>.W <Rd>, <Rm>, <type> <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in
T1
MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Related encodings: In encoding T1, for a op field value that is not described above, see Data-processing (two low registers).

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Alias conditions

Alias	of variant	is preferred when
ASRS (register)	A1 (flag setting)	`S == '1' && type == '10'`
ASRS (register)	T1 (arithmetic shift right)	`op == '0100' && !InITBlock()`
ASRS (register)	T2 (flag setting)	`type == '10' && S == '1'`
ASR (register)	A1 (not flag setting)	`S == '0' && type == '10'`
ASR (register)	T1 (arithmetic shift right)	`op == '0100' && InITBlock()`
ASR (register)	T2 (not flag setting)	`type == '10' && S == '0'`
LSLS (register)	A1 (flag setting)	`S == '1' && type == '00'`
LSLS (register)	T1 (logical shift left)	`op == '0010' && !InITBlock()`
LSLS (register)	T2 (flag setting)	`type == '00' && S == '1'`
LSL (register)	A1 (not flag setting)	`S == '0' && type == '00'`
LSL (register)	T1 (logical shift left)	`op == '0010' && InITBlock()`
LSL (register)	T2 (not flag setting)	`type == '00' && S == '0'`
LSRS (register)	A1 (flag setting)	`S == '1' && type == '01'`
LSRS (register)	T1 (logical shift right)	`op == '0011' && !InITBlock()`
LSRS (register)	T2 (flag setting)	`type == '01' && S == '1'`
LSR (register)	A1 (not flag setting)	`S == '0' && type == '01'`
LSR (register)	T1 (logical shift right)	`op == '0011' && InITBlock()`
LSR (register)	T2 (not flag setting)	`type == '01' && S == '0'`
RORS (register)	A1 (flag setting)	`S == '1' && type == '11'`
RORS (register)	T1 (rotate right)	`op == '0111' && !InITBlock()`
RORS (register)	T2 (flag setting)	`type == '11' && S == '1'`
ROR (register)	A1 (not flag setting)	`S == '0' && type == '11'`
ROR (register)	T1 (rotate right)	`op == '0111' && InITBlock()`
ROR (register)	T2 (not flag setting)	`type == '11' && S == '0'`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdm>` Is the general-purpose source register and the destination register, encoded in the "Rdm" field.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` Is the general-purpose source register, encoded in the "Rm" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

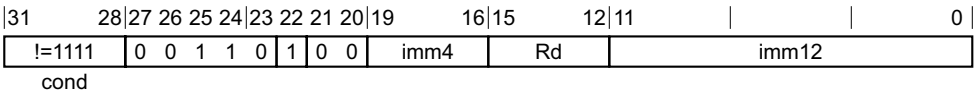
F5.1.111 MOVT

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

A1



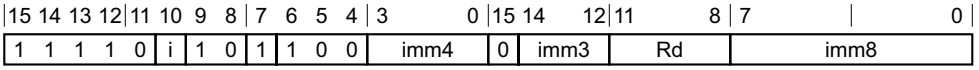
A1 variant

```
MOVT{<c>}{<q>} <Rd>, #<imm16>
```

Decode for this encoding

```
d = UInt(Rd);  imm16 = imm4:imm12;
if d == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
MOVT{<c>}{<q>} <Rd>, #<imm16>
```

Decode for this encoding

```
d = UInt(Rd);  imm16 = imm4:i:imm3:imm8;
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm16>	For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

F5.1.112 MRC, MRC2

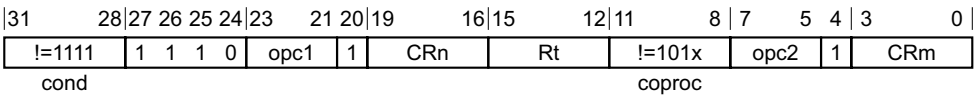
Move to general-purpose register from Coprocessor causes a conceptual coprocessor to transfer a value to a general-purpose register or to the condition flags.

This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `opc1`, `opc2`, `CRn`, and `CRd` field values that are valid `MRC` and `MRC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

In an implementation that includes EL2, `MRC` accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an `MRC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *EL2 configurable controls* on page G1-3751.

Because of the range of possible traps to Hyp mode, the `MRC` pseudocode does not show these possible traps.

A1



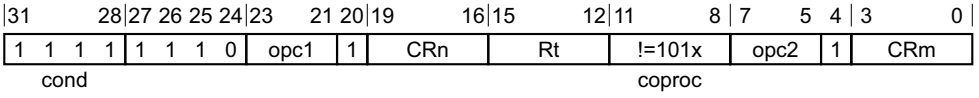
A1 variant

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

A2



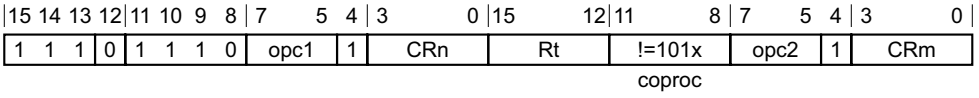
A2 variant

```
MRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

T1



T1 variant

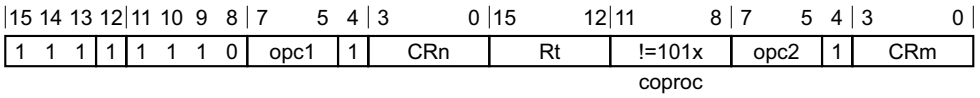
```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

T2



T2 variant

```
MRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Advanced SIMD and floating-point: See *Floating-point and Advanced SIMD 32-bit register moves* on page F3-2367 for the T32 instruction set, or *Floating-point and Advanced SIMD 32-bit register moves* on page F4-2451 for the A32 instruction set.

Assembler symbols

`<c>`	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. `<c>` must be `AL` or omitted.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<coproc>`	Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.
`<opc1>`	Is a coprocessor-specific opcode in the range 0 to 7, encoded in the "opc1" field.
`<Rt>`	Is the general-purpose register to be transferred or `APSR_nzcv` (encoded as `0b1111`), encoded in the "Rt" field. If `APSR_nzcv` is used, bits [31:28] of the transferred value are written to the PSTATE condition flags.
`<CRn>`	Is the first coprocessor register, encoded in the "CRn" field.
`<CRm>`	Is the second coprocessor register, encoded in the "CRm" field.
`<opc2>`	Is a coprocessor-specific opcode in the range 0 to 7, defaulting to 0 and encoded in the "opc2" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    value = Coproc_GetOneWord(cp, ThisInstr());
    if t != 15 then
        R[t] = value;
```

F5.1.113 MRRC, MRRC2

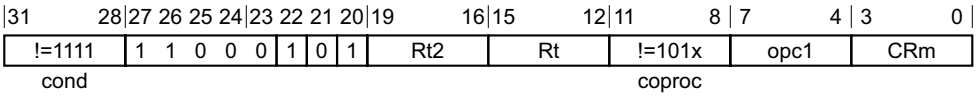
Move to two general-purpose registers from Coprocessor causes a conceptual coprocessor to transfer values to two general-purpose registers.

This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `opc1`, and `CRm` field values that are valid `MRRC` and `MRRC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

In an implementation that includes EL2, `MRRC` accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an `MRRC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *EL2 configurable controls* on page G1-3751.

Because of the range of possible traps to Hyp mode, the `MRRC` pseudocode does not show these possible traps.

A1



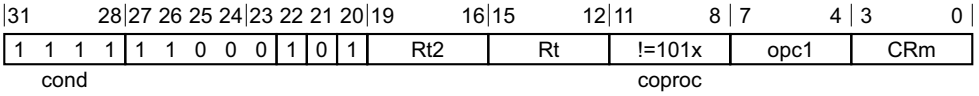
A1 variant

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

A2



A2 variant

```
MRRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

T1

Non-Confidential - Beta

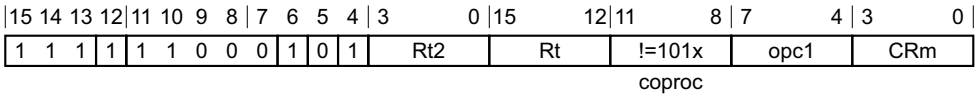
T1 variant

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T2



T2 variant

```
MRRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Advanced SIMD and floating-point: See *Advanced SIMD and floating-point 64-bit move* on page F3-2363 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-2446 for the A32 instruction set.

Assembler symbols

<c>	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<coproc>	Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.
<opc1>	Is a coprocessor-specific opcode in the range 0 to 15, encoded in the "opc1" field.
<Rt>	Is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	Is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<CRm>	Is a coprocessor register, encoded in the "CRm" field.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected coprocessor register, while <Rt> transfers bits[31:0].

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    (R[t2], R[t]) = Coproc_GetTwoWords(cp, ThisInstr());
```

Non-Confidential - Beta

F5.1.114 MRS

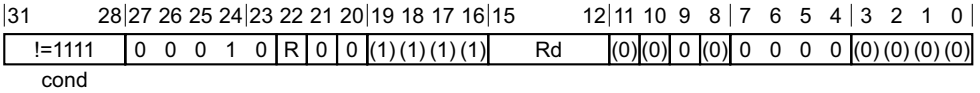
Move Special register to general-purpose register moves the value of the APSR, CPSR, or SPSR_<current_mode> into a general-purpose register.

ARM recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR* on page E1-2214.

An MRS that accesses the SPSR is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the CPSR returns an UNKNOWN value for the CPSR.{E, A, I, F, M} fields.

A1



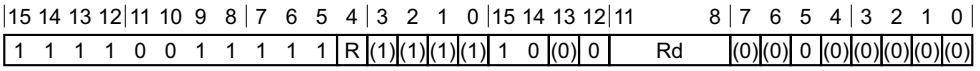
A1 variant

```
MRS{<c>}{<q>} <Rd>, <spec_reg>
```

Decode for this encoding

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
MRS{<c>}{<q>} <Rd>, <spec_reg>
```

Decode for this encoding

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *MRS* on page K1-5347.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<spec_reg> Is the special register to be accessed, encoded in the "R" field. It can have the following values:

CPSR|APSR when R = 0

SPSR when R = 1

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if read_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            R[d] = SPSR[];
    else
        // CPSR has same bit assignments as SPSR, but with the IT, J, SS, IL, and T bits masked out.
        bits(32) mask = '11111000 00001111 00000011 11011111';
        psr_val = GetPSRFromPSTATE() AND mask;
        if PSTATE.EL == EL0 then
            // If accessed from User mode return UNKNOWN values for E, A, I, F bits, bits<9:6>,
            // and for the M field, bits<4:0>
            psr_val<9:6> = bits(4) UNKNOWN;
            psr_val<4:0> = bits(5) UNKNOWN;
        R[d] = psr_val;
```

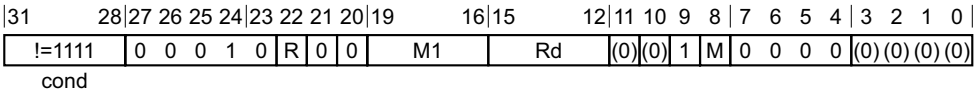
F5.1.115 MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or SPSR of the specified mode, or the value of *ELR_hyp* on page G1-3662, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F5-3103.

A1



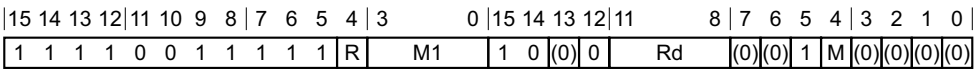
A1 variant

```
MRS{<c>}{<q>} <Rd>, <banked_reg>
```

Decode for this encoding

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE;
SYSm = M:M1;
```

T1



T1 variant

```
MRS{<c>}{<q>} <Rd>, <banked_reg>
```

Decode for this encoding

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
SYSm = M:M1;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<banked_reg> Is the name of the banked register to be transferred to or from, encoded in the "R:M:M1" field. It can have the following values:

R8_usr	when R = 0, M = 0, M1 = 0000

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.

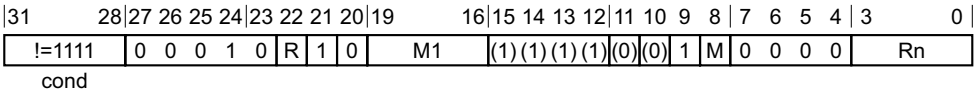
F5.1.116 MSR (Banked register)

Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to the Banked general-purpose register or SPSR of the specified mode, or to *ELR_hyp* on page G1-3662.

MSR (Banked register) is UNPREDICTABLE if executed in User mode.

The effect of using an MSR (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F5-3103.

A1



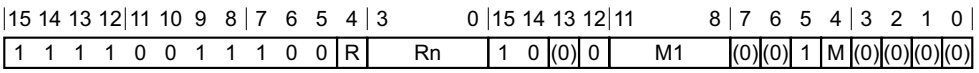
A1 variant

```
MSR{<c>}{<q>} <banked_reg>, <Rn>
```

Decode for this encoding

```
n = UInt(Rn);  write_spsr = (R == '1');
if n == 15 then UNPREDICTABLE;
SYSm = M:M1;
```

T1



T1 variant

```
MSR{<c>}{<q>} <banked_reg>, <Rn>
```

Decode for this encoding

```
n = UInt(Rn);  write_spsr = (R == '1');
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
SYSm = M:M1;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<banked_reg> Is the name of the banked register to be transferred to or from, encoded in the "R:M:M1" field. It can have the following values:

R8_usr	when R = 0, M = 0, M1 = 0000

F5.1.117 MSR (immediate)

Move immediate value to Special register moves selected bits of an immediate value to the corresponding bits in the APSR, CPSR, or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, the immediate form of MSR is normally only useful at the Application level for writing to APSR_nzcvq (CPSR_f).

If an MSR (immediate) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3667.

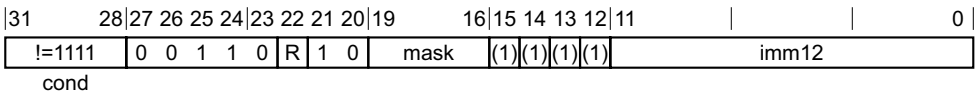
An MSR (immediate) executed in User mode:

- Is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher,

An MSR (immediate) executed in System mode is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

A1



A1 variant

Applies when !(R == 0 && mask == 0000).

```
MSR{<c>}{<q>} <spec_reg>, #<imm>
```

Decode for this encoding

```
if mask == '0000' && R == '0' then SEE "Related encodings";
imm32 = A32ExpandImm(imm12);  write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *MSR (immediate)* on page K1-5347.

Related encodings: Move Special Register & Hints (immediate).

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<spec_reg> Is one of:

- APSR_<bits>.
- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.

x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.

s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`f` mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of `nzcvq`, `g`, or `nzcvqg`. These map to the following CPSR_<fields> values:

- `APSR_nzcvq` is the same as `CPSR_f` (mask== '1000').
- `APSR_g` is the same as `CPSR_s` (mask == '0100').
- `APSR_nzcvqg` is the same as `CPSR_fs` (mask == '1100').

ARM recommends the `APSR_<bits>` forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR* on page E1-2214.

`<imm>` Is an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(imm32, mask);
```

F5.1.118 MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the APSR, CPSR or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR_nzcvq (CPSR_f).

If an MSR (register) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3667.

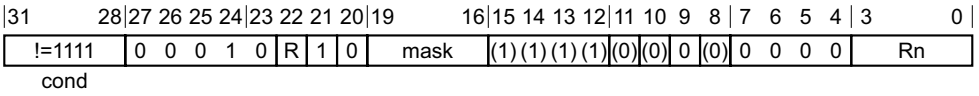
An MSR (register) executed in User mode:

- Is UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

A1



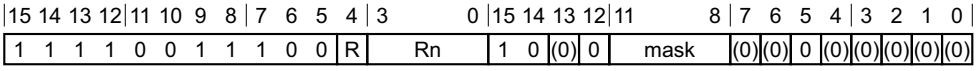
A1 variant

```
MSR{<c>}{<q>} <spec_reg>, <Rn>
```

Decode for this encoding

```
n = UInt(Rn);  write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
MSR{<c>}{<q>} <spec_reg>, <Rn>
```

Decode for this encoding

```
n = UInt(Rn);  write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *MSR (register)* on page K1-5318.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<spec_reg> Is one of:

- APSR_<bits>.
- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.

x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.

s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.

f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvq, g, or nzcvqg. These map to the following CPSR_<fields> values:

- APSR_nzcvq is the same as CPSR_f (mask== '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvqg is the same as CPSR_fs (mask == '1100').

ARM recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR* on page E1-2214.

<Rn> Is the general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(R[n], mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(R[n], mask);
```

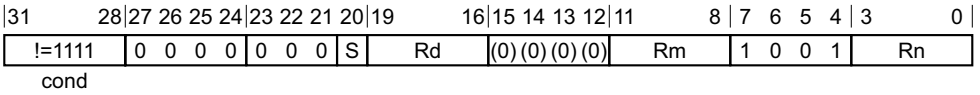
F5.1.119 MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

A1



Flag setting variant

Applies when `S == 1`.

```
MULS{<c>}{<q>} <Rd>, <Rn>{, <Rm>}
```

Not flag setting variant

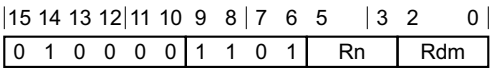
Applies when `S == 0`.

```
MUL{<c>}{<q>} <Rd>, <Rn>{, <Rm>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



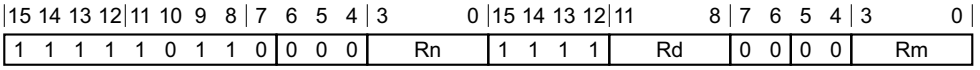
T1 variant

```
MUL<c>{<q>} <Rdm>, <Rn>{, <Rdm>} // Inside IT block
MULS{<q>} <Rdm>, <Rn>{, <Rdm>} // Outside IT block
```

Decode for this encoding

```
d = UInt(Rdm);  n = UInt(Rn);  m = UInt(Rdm);  setflags = !InITBlock();
```

T2



T2 variant

```
MUL<c>.W <Rd>, <Rn>{, <Rm>} // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
MUL{<c>}{<q>} <Rd>, <Rn>{, <Rm>}
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rdm>	Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
    result = operand1 * operand2;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
```

F5.1.120 MVN, MVNS (immediate)

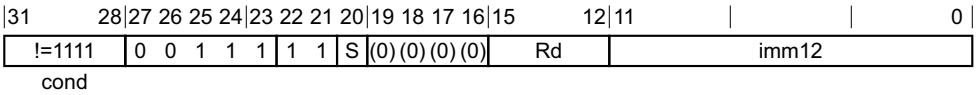
Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



MVN variant

Applies when S == 0.

```
MVN{<c>}{<q>} <Rd>, #<const>
```

MVNS variant

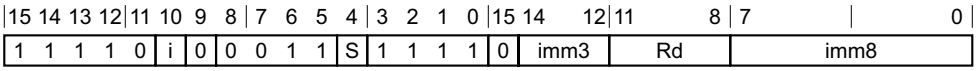
Applies when S == 1.

```
MVNS{<c>}{<q>} <Rd>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



MVN variant

Applies when S == 0.

```
MVN{<c>}{<q>} <Rd>, #<const>
```

MVNS variant

Applies when S == 1.

```
MVNS{<c>}{<q>} <Rd>, #<const>
```

Non-Confidential - Beta

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the MVNS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = NOT(imm32);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.121 MVN, MVNS (register)

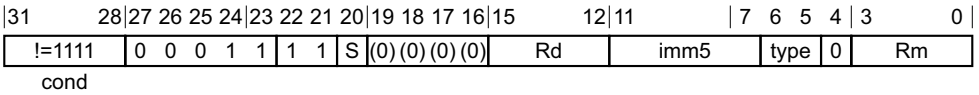
Bitwise NOT (register) writes the bitwise inverse of a register value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



MVN, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
MVN{<c>}{<q>} <Rd>, <Rm>, RRX
```

MVN, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
MVN{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MVNS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
MVNS{<c>}{<q>} <Rd>, <Rm>, RRX
```

MVNS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
MVNS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the MVNS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = NOT(shifted);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

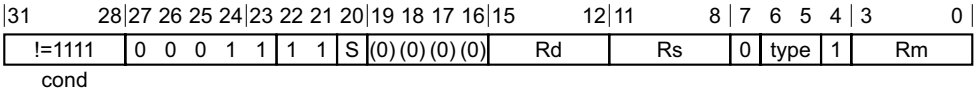
Non-Confidential - Beta

F5.1.122 MVN, MVNS (register-shifted register)

Bitwise NOT (register-shifted register) writes the bitwise inverse of a register-shifted register value to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
MVNS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
MVN{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` Is the general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);

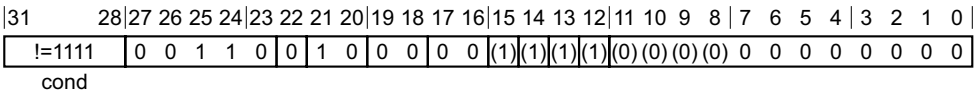
F5.1.123 NOP

No Operation does nothing. This instruction can be used for instruction alignment purposes.

Note

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

A1



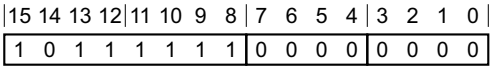
A1 variant

```
NOP{<c>}{<q>}
```

Decode for this encoding

```
// No additional decoding required
```

T1



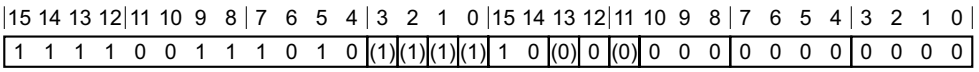
T1 variant

```
NOP{<c>}{<q>}
```

Decode for this encoding

```
// No additional decoding required
```

T2



T2 variant

```
NOP{<c>}.W
```

Decode for this encoding

```
// No additional decoding required
```

Notes for all encodings

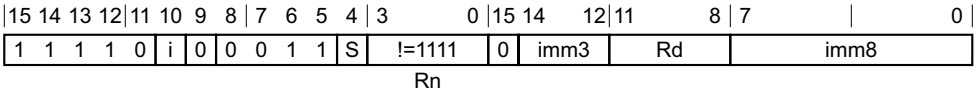
F5.1.124 ORN, ORNS (immediate)

Bitwise OR NOT (immediate) performs a bitwise (inclusive) OR of a register value and the complement of an immediate value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

T1



Flag setting variant

Applies when `S == 1`.

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Not flag setting variant

Applies when `S == 0`.

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE MVN (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<const>	An immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR NOT(imm32);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

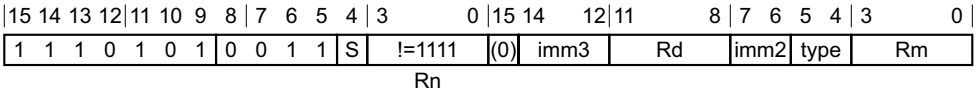
F5.1.125 ORN, ORNS (register)

Bitwise OR NOT (register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

T1



ORN, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORN, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ORNS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORNS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE MVN (register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.

F5.1.126 ORR, ORRS (immediate)

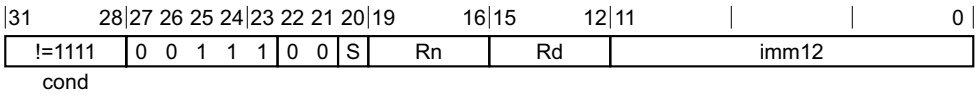
Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ORR variant

Applies when S == 0.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ORRS variant

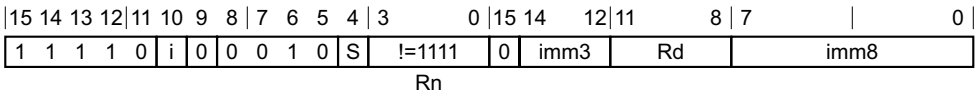
Applies when S == 1.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



ORR variant

Applies when S == 0.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

ORRS variant

Applies when S == 1.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE MOV (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

F5.1.127 ORR, ORRS (register)

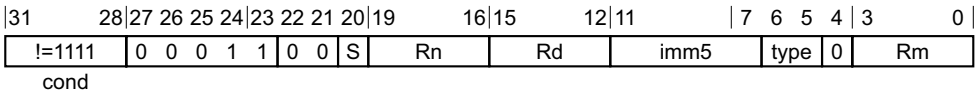
Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



ORR, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORR, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ORRS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORRS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

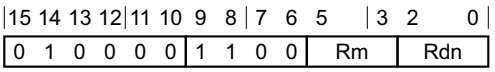
T1



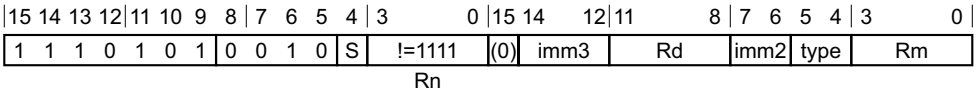
T1 variant

```
ORR<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
ORRS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



ORR, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORR, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORR<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ORRS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && imm2 == 00 && type == 11`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORRS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORRS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "Related encodings";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Related Encodings: Data-processing (shifted register)

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

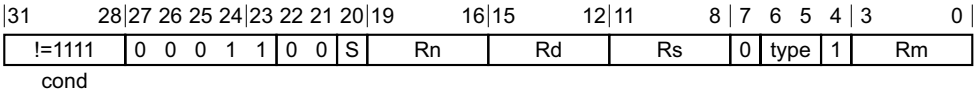
F5.1.128 ORR, ORRS (register-shifted register)

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

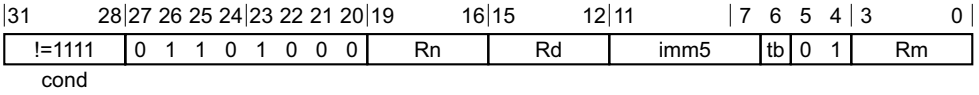
F5.1.129 PKHBT, PKHTB

Pack Halfword combines one halfword of its first operand with the other halfword of its shifted second operand.

A1



PKHBT variant

Applies when `tb == 0`.

```
PKHBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, LSL #<imm>}
```

PKHTB variant

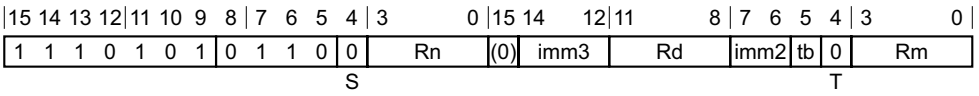
Applies when `tb == 1`.

```
PKHTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ASR #<imm>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm5);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



PKHBT variant

Applies when `tb == 0`.

```
PKHBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, LSL #<imm>} // tbform == FALSE
```

PKHTB variant

Applies when `tb == 1`.

```
PKHTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ASR #<imm>} // tbform == TRUE
```

Decode for all variants of this encoding

```
if S == '1' || T == '1' then UNDEFINED;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1: the shift to apply to the value read from `<Rm>`, encoded in imm5. Is one of:

`omitted` No shift, encoded as `0b00000`.

`1-31` Left shift by specified number of bits, encoded as a binary number.

For encoding A1: the shift to apply to the value read from `<Rm>`, encoded in imm5. Is one of:

`omitted` Instruction is a pseudo-instruction and is assembled as though `PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn>` had been written.

`1-32` Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as `0b00000`. Other shift amounts are encoded as binary numbers.

Note

An assembler can permit `<imm>` = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

For encoding T1: the shift to apply to the value read from `<Rm>`, encoded in imm3:imm2. For `PKHBT`, it is one of:

`omitted` No shift, encoded as `0b00000`.

`1-31` Left shift by specified number of bits, encoded as a binary number.

For `PKHTB`, it is one of:

`omitted` Instruction is a pseudo-instruction and is assembled as though `PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn>` had been written.

`1-32` Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as `0b00000`. Other shift amounts are encoded as binary numbers.

Note

An assembler can permit `<imm>` = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = Shift(R[m], shift_t, shift_n, PSTATE.C);  // PSTATE.C ignored
    R[d]<15:0>  = if tbform then operand2<15:0> else R[n]<15:0>;
    R[d]<31:16> = if tbform then R[n]<31:16>    else operand2<31:16>;
```

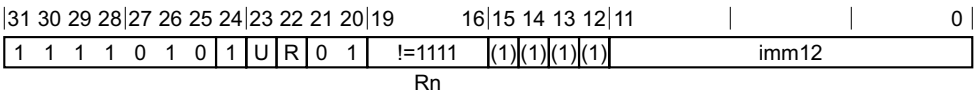
F5.1.130 PLD, PLDW (immediate)

Preload Data (immediate) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches on page E2-2237*.

A1



Preload read variant

Applies when R == 1.

```
PLD{<c>}{<q>} [<Rn> {, #{+/-}<imm>}]
```

Preload write variant

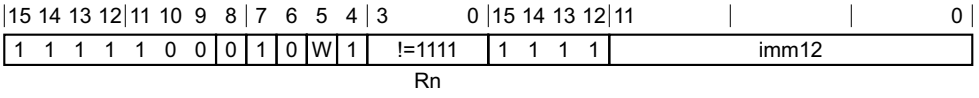
Applies when R == 0.

```
PLDW{<c>}{<q>} [<Rn> {, #{+/-}<imm>}]
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');  is_pldw = (R == '0');
```

T1



Preload read variant

Applies when W == 0.

```
PLD{<c>}{<q>} [<Rn> {, #{+}<imm>}]
```

Preload write variant

Applies when W == 1.

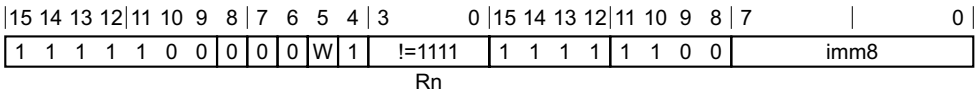
```
PLDW{<c>}{<q>} [<Rn> {, #{+}<imm>}]
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = TRUE;  is_pldw = (W == '1');
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



Preload read variant

Applies when `W == 0`.

```
PLD{<c>}{<q>} [<Rn> {, #-<imm>}]
```

Preload write variant

Applies when `W == 1`.

```
PLDW{<c>}{<q>} [<Rn> {, #-<imm>}]
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);  add = FALSE;  is_pldw = (W == '1');
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2322. Must be `AL` or omitted.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see PLD (literal).

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (R[n] + imm32) else (R[n] - imm32);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```

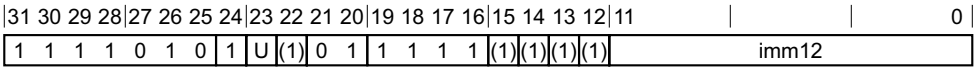
Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.131 PLD (literal)

Preload Data (literal) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The effect of a PLD instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2237.

A1



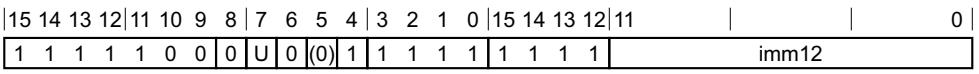
A1 variant

```
PLD{<c>}{<q>} <label> // Normal form
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

T1



T1 variant

```
PLD{<c>}{<q>} <label> // Preferred syntax
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax
```

Decode for this encoding

```
imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2322. Must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<label> The label of the literal data item that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095. If the offset is zero or positive, imm32 is equal to the offset and add == TRUE. If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    Hint_PreloadData(address);
```

Non-Confidential - Beta

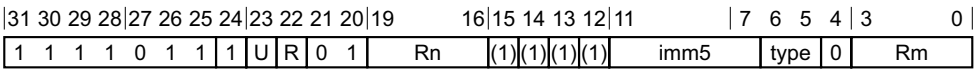
F5.1.132 PLD, PLDW (register)

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2237.

A1



Preload read, optional shift or rotate variant

Applies when `R == 1 && !(imm5 == 00000 && type == 11)`.

```
PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

Preload read, rotate right with extend variant

Applies when `R == 1 && imm5 == 00000 && type == 11`.

```
PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

Preload write, optional shift or rotate variant

Applies when `R == 0 && !(imm5 == 00000 && type == 11)`.

```
PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

Preload write, rotate right with extend variant

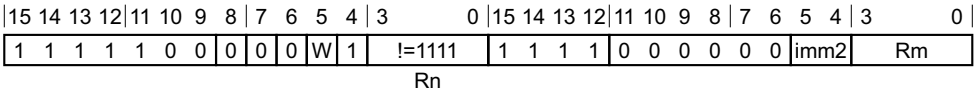
Applies when `R == 0 && imm5 == 00000 && type == 11`.

```
PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);  add = (U == '1');  is_pldw = (R == '0');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 || (n == 15 && is_pldw) then UNPREDICTABLE;
```

T1



Preload read variant

Applies when `W == 0`.

```
PLD{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

Preload write variant

Applies when `W == 1`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
PLDW{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  m = UInt(Rm);  add = TRUE;  is_pldw = (W == '1');
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.

For encoding T1: see *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

\+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```

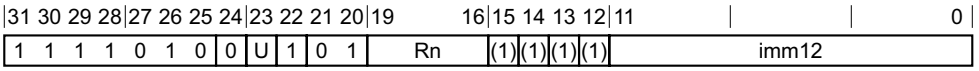
F5.1.133 PLI (immediate, literal)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2237.

A1



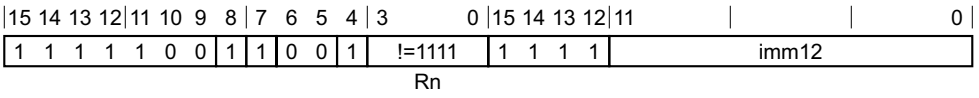
A1 variant

```
PLI{<c>}{<q>} [<Rn> {, #{+/-}<imm>}]
PLI{<c>}{<q>} <label> // Normal form
PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative form
```

Decode for this encoding

```
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

T1



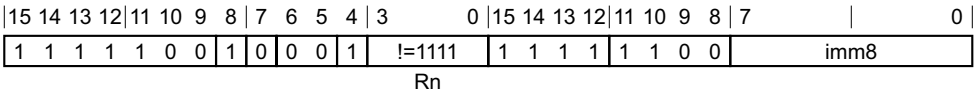
T1 variant

```
PLI{<c>}{<q>} [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE encoding T3;
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = TRUE;
```

T2



T2 variant

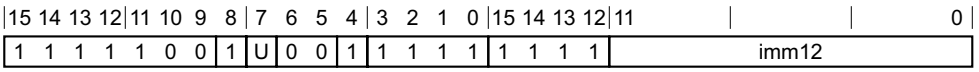
```
PLI{<c>}{<q>} [<Rn> {, #-<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE encoding T3;
n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);  add = FALSE;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T3



T3 variant

```
PLI{<c>}{<q>} <label> // Preferred syntax
PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax
```

Decode for this encoding

```
n = 15;  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2322. Must be `AL` or omitted.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<label>` The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. The offset must be in the range –4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as `0b1111` in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

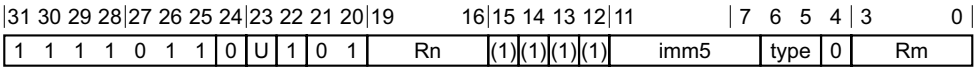
F5.1.134 PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2237.

A1



Rotate right with extend variant

Applies when `imm5 == 00000 && type == 11`.

```
PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

Shift or rotate by value variant

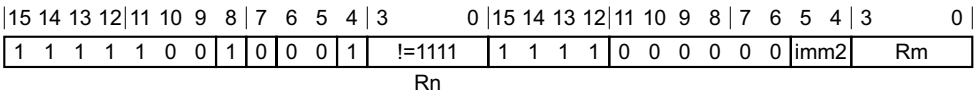
Applies when `!(imm5 == 00000 && type == 11)`.

```
PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);  add = (U == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
PLI{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

Decode for this encoding

```
if Rn == '1111' then SEE PLI (immediate, literal);
n = UInt(Rn);  m = UInt(Rm);  add = TRUE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: see *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    Hint_PreloadInstr(address);
```

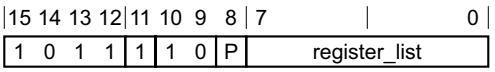
F5.1.135 POP

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

T1



T1 variant

```
POP{<c>}{<q>} <registers> // Preferred syntax
LDM{<c>}{<q>} SP!, <registers> // Alternate syntax
```

Decode for this encoding

```
registers = P:'0000000':register_list;   UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *POP (T32)* on page K1-5318 and *POP (A32)* on page K1-5318.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0. If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
    if registers<15> == '1' then
        if UnalignedAllowed then
            if address<1:0> == '00' then
                LoadWritePC(MemU[address,4]);
            else
```

Non-Confidential - Beta

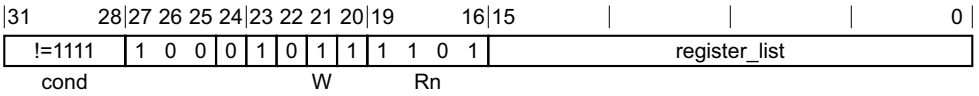
F5.1.136 POP (multiple registers)

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data

This instruction is an alias of the LDM, LDMIA, LDMFD instruction. This means that:

- The encodings in this description are named to match the encodings of LDM, LDMIA, LDMFD.
- The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.

A1



A1 variant

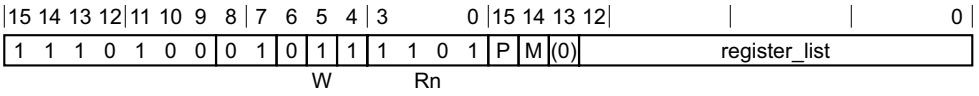
```
POP{<c>}{<q>} <registers>
```

is equivalent to

```
LDM{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

T2



T2 variant

```
POP{<c>}{<q>} <registers>
```

is equivalent to

```
LDM{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<registers>` For encoding A1: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328. If the SP is in the list, the value of the SP after such an instruction is UNKNOWN. The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211. ARM deprecates the use of this instruction with both the LR and the PC in the list.

For encoding T2: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of*

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

lists of general-purpose registers and the PC on page F2-2328. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

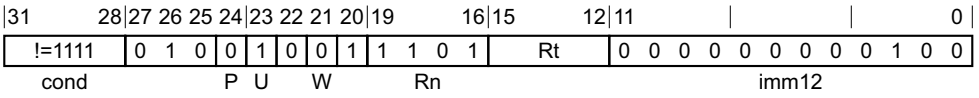
F5.1.137 POP (single register)

Pop Single Register from Stack loads a single general-purpose register from the stack, loading from the address in SP, and updates SP to point just above the loaded data

This instruction is an alias of the LDR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of LDR (immediate).
- The description of LDR (immediate) gives the operational pseudocode for this instruction.

A1



Post-indexed variant

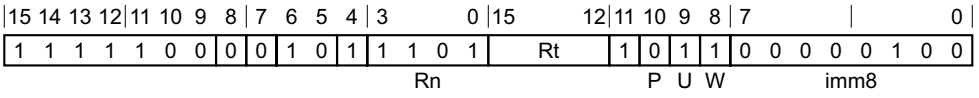
```
POP{<c>}{<q>} <single_register_list>
```

is equivalent to

```
LDR{<c>}{<q>} <Rt>, [SP], #4
```

and is always the preferred disassembly.

T4



Post-indexed variant

```
POP{<c>}{<q>} <single_register_list>
```

is equivalent to

```
LDR{<c>}{<q>} <Rt>, [SP], #4
```

and is always the preferred disassembly.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<single_register_list>

Is the general-purpose register <Rt> to be loaded surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Operation for all encodings

The description of LDR (immediate) gives the operational pseudocode for this instruction.

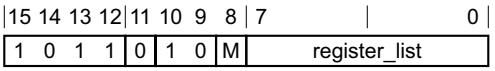
Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.138 PUSH

Push Multiple Registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

T1



T1 variant

```
PUSH{<c>}{<q>} <registers> // Preferred syntax
STMDB{<c>}{<q>} SP!, <registers> // Alternate syntax
```

Decode for this encoding

```
registers = '0':M:'000000':register_list;  UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *PUSH* on page K1-5319.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the LR. If the LR is in the list, the "M" field is set to 1, otherwise this field defaults to 0.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == 13 && i != LowestSetBit(registers) then  // Only possible for encoding A1
                MemA[address,4] = bits(32) UNKNOWN;
            else
                if UnalignedAllowed then
                    MemU[address,4] = R[i];
                else
                    MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then  // Only possible for encoding A1 or A2
        if UnalignedAllowed then
            MemU[address,4] = PCStoreValue();
        else
            MemA[address,4] = PCStoreValue();
    SP = SP - 4*BitCount(registers);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

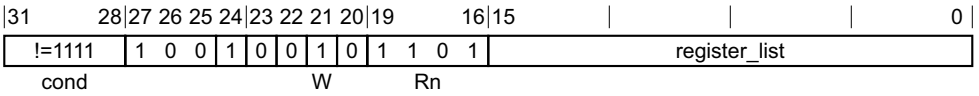
F5.1.139 PUSH (multiple registers)

Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the STMDB, STMFD instruction. This means that:

- The encodings in this description are named to match the encodings of STMDB, STMFD.
- The description of STMDB, STMFD gives the operational pseudocode for this instruction.

A1



A1 variant

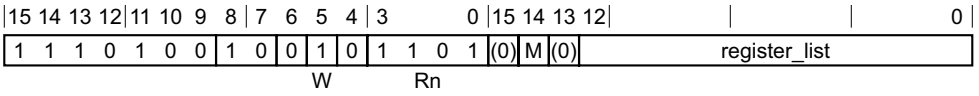
```
PUSH{<c>}{<q>} <registers>
```

is equivalent to

```
STMDB{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

T1



T1 variant

```
PUSH{<c>}{<q>} <registers>
```

is equivalent to

```
STMDB{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<registers>` For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328. The SP and PC can be in the list. However:

- ARM deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

The description of STMDB, STMFD gives the operational pseudocode for this instruction.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

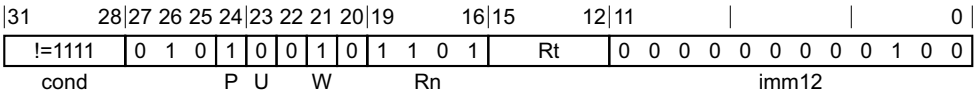
F5.1.140 PUSH (single register)

Push Single Register to Stack stores a single general-purpose register to the stack, storing to the 32-bit word below the address in SP, and updates SP to point to the start of the stored data

This instruction is an alias of the STR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of STR (immediate).
- The description of STR (immediate) gives the operational pseudocode for this instruction.

A1



Pre-indexed variant

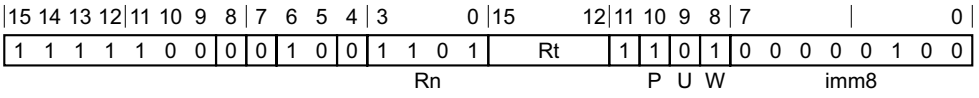
```
PUSH{<c>}{<q>} <single_register_list>
```

is equivalent to

```
STR{<c>}{<q>} <Rt>, [SP, #4]!
```

and is always the preferred disassembly.

T4



Pre-indexed variant

```
PUSH{<c>}{<q>} <single_register_list> // Standard syntax
```

is equivalent to

```
STR{<c>}{<q>} <Rt>, [SP, #-4]!
```

and is always the preferred disassembly.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<single_register_list>
Is the general-purpose register <Rt> to be stored surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

Operation for all encodings

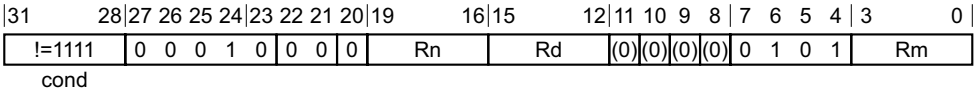
The description of STR (immediate) gives the operational pseudocode for this instruction.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.141 QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range -2^{31} to $(2^{31} - 1)$, and writes the result to the destination register. If saturation occurs, it sets PSTATE.Q to 1.

A1



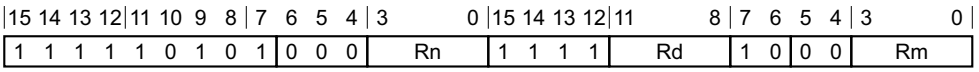
A1 variant

```
QADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
QADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

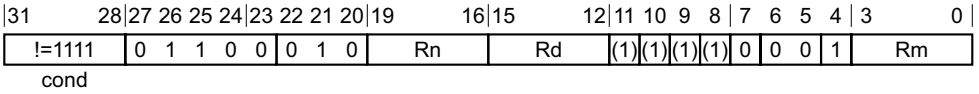
F5.1.142 QADD16

Saturating Add 16 performs two 16-bit integer additions, saturates the results to the 16-bit signed integer range $-2^{15} <= x <= 2^{15} - 1$, and writes the results to the destination register.

A1



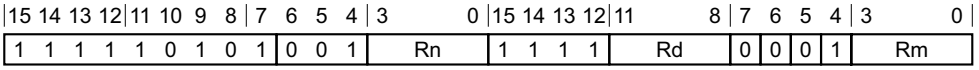
A1 variant

```
QADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
QADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

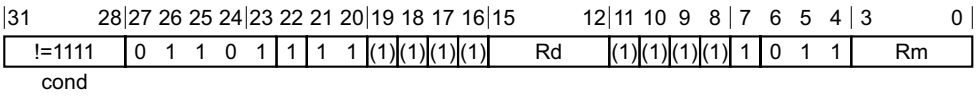
F5.1.154 REVSH

Byte-Reverse Signed Halfword reverses the byte order in the lower 16-bit halfword of a 32-bit register, and sign-extends the result to 32 bits.

A1



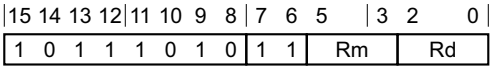
A1 variant

```
REVSH{<c>}{<q>} <Rd>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



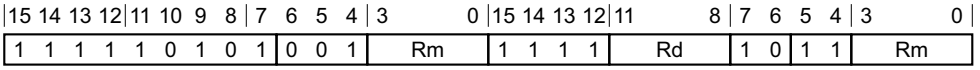
T1 variant

```
REVSH{<c>}{<q>} <Rd>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);
```

T2



T2 variant

```
REVSH{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1
REVSH{<c>}{<q>} <Rd>, <Rm>
```

Decode for this encoding

```
if !Consistent(Rm) then UNPREDICTABLE;
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *REVSH* on page K1-5321.

F5.1.155 RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:

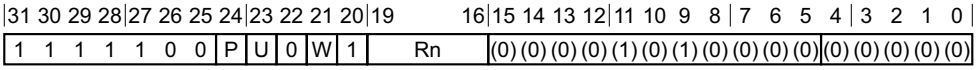
- The word loaded from the lower address is treated as an instruction address. The PE branches to it.
- The word loaded from the higher address is used to restore PSTATE. This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

A1



Decrement After variant

Applies when P == 0 && U == 0.

```
RFEDA{<c>}{<q>} <Rn>{!}
```

Decrement Before variant

Applies when P == 1 && U == 0.

```
RFEDB{<c>}{<q>} <Rn>{!}
```

Increment After variant

Applies when P == 0 && U == 1.

```
RFE{IA}{<c>}{<q>} <Rn>{!}
```

Increment Before variant

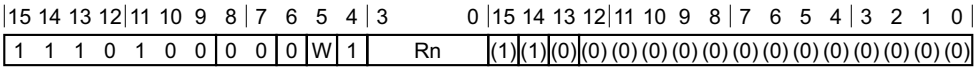
Applies when P == 1 && U == 1.

```
RFEIB{<c>}{<q>} <Rn>{!}
```

Decode for all variants of this encoding

```
n = UInt(Rn);
wback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
```

T1



T1 variant

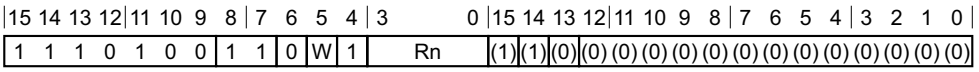
```
RFEDB{<c>}{<q>} <Rn>{!} // Outside or last in IT block
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
n = UInt(Rn);  wback = (W == '1');  increment = FALSE;  wordhigher = FALSE;
if n == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T2



T2 variant

```
RFE{IA}{<c>}{<q>} <Rn>{!} // Outside or last in IT block
```

Decode for this encoding

```
n = UInt(Rn);  wback = (W == '1');  increment = TRUE;  wordhigher = FALSE;
if n == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *RFE* on page K1-5348.

Assembler symbols

IA	For encoding A1: is an optional suffix to indicate the Increment After variant. For encoding T2: is an optional suffix for the Increment After form.
<c>	For encoding A1: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted. For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

RFEFA, RFEEA, RFEFD, and RFEED are pseudo-instructions for RFEDA, RFEDB, RFEIA, and RFEIB respectively, referring to their use for popping data from Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.EL == EL0 then
        UNPREDICTABLE;                          // UNDEFINED or NOP
    else
        address = if increment then R[n] else R[n]-8;
        if wordhigher then address = address+4;
        new_pc_value = MemA[address,4];
        spsr = MemA[address+4,4];
        if wback then R[n] = if increment then R[n]+8 else R[n]-8;
        AArch32.ExceptionReturn(new_pc_value, spsr);
```

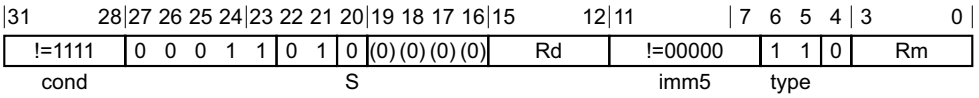
F5.1.156 ROR (immediate)

Rotate Right (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOV, shift or rotate by value variant

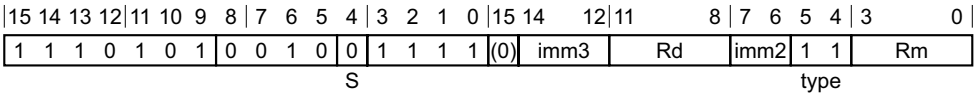
```
ROR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

T3



MOV, shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00)`.

```
ROR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T3: is the general-purpose source register, encoded in the "Rm" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<imm> For encoding A1: is the shift amount, in the range 1 to 31, encoded in the "imm5" field.

For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

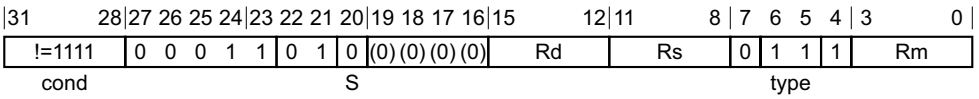
F5.1.157 ROR (register)

Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

A1



Not flag setting variant

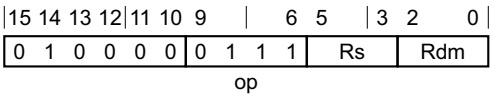
```
ROR{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

and is always the preferred disassembly.

T1



Rotate right variant

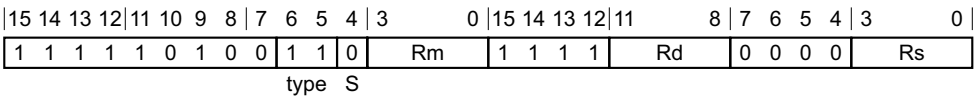
```
ROR<c>{<q>} {<Rdm>,} <Rdm>, <Rs> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs>
```

and is the preferred disassembly when `InITBlock()`.

T2



Not flag setting variant

```
ROR<c>.W {<Rd>,} <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

F5.1.158 RORS (immediate)

Rotate Right, setting flags (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

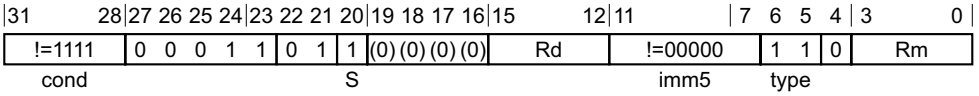
The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOVS, shift or rotate by value variant

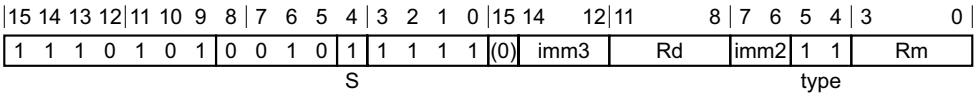
```
RORS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

T3



MOVS, shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00)`.

```
RORS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

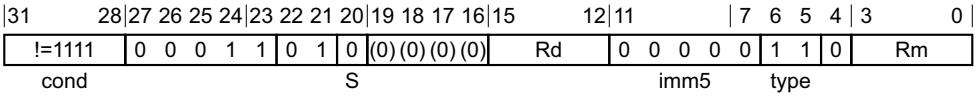
F5.1.160 RRX

Rotate Right with Extend provides the value of the contents of a register shifted right by one place, with the Carry flag shifted into bit[31].

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOV, rotate right with extend variant

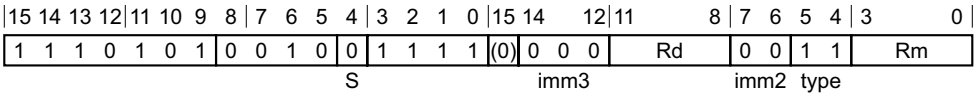
```
RRX{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

T3



MOV, rotate right with extend variant

```
RRX{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

F5.1.161 RRXS

Rotate Right with Extend, setting flags provides the value of the contents of a register shifted right by one place, with the Carry flag shifted into bit[31].

If the destination register is not the PC, this instruction updates the condition flags based on the result, and bit[0] is shifted into the Carry flag.

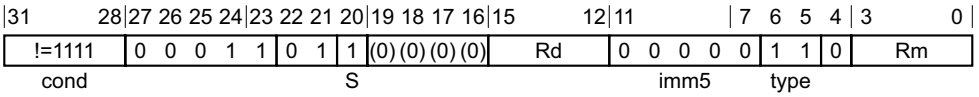
The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1



MOVS, rotate right with extend variant

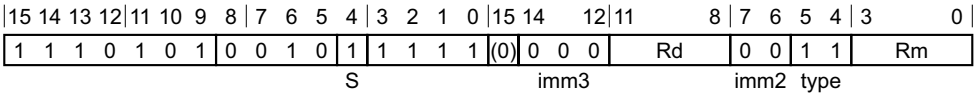
```
RRXS{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

T3



MOVS, rotate right with extend variant

```
RRXS{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

F5.1.162 RSB, RSBS (immediate)

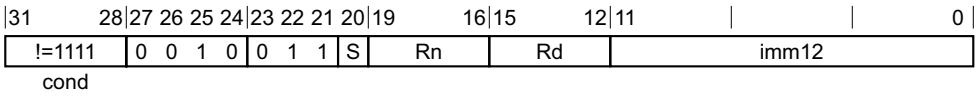
Reverse Subtract (immediate) subtracts a register value from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



RSB variant

Applies when S == 0.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

RSBS variant

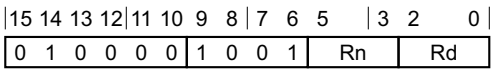
Applies when S == 1.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



T1 variant

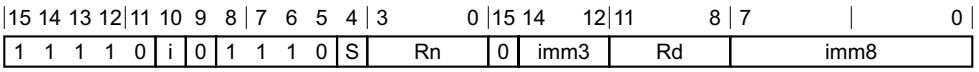
```
RSB<c>{<q>} {<Rd>, }<Rn>, #0 // Inside IT block
RSBS{<q>} {<Rd>, }<Rn>, #0 // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = Zeros(32); // immediate = #0
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



RSB variant

Applies when `S == 0`.

```
RSB<c>.W {<Rd>,} <Rn>, #0 // Inside IT block
RSB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

RSBS variant

Applies when `S == 1`.

```
RSBS.W {<Rd>,} <Rn>, #0 // Outside IT block
RSBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

F5.1.163 RSB, RSBS (register)

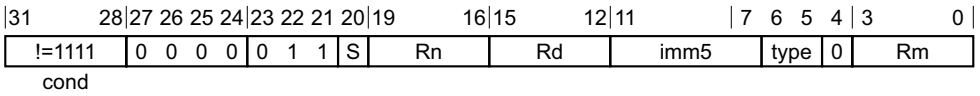
Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



RSB, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSB, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

RSBS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSBS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

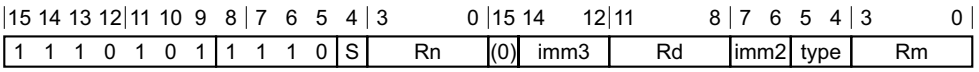
Non-Confidential - Beta

T1



RSB, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSB, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

RSBS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && imm2 == 00 && type == 11`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSBS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

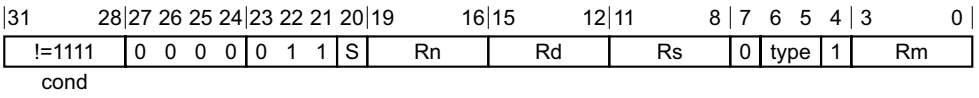
Non-Confidential - Beta

F5.1.164 RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

F5.1.165 RSC, RSCS (immediate)

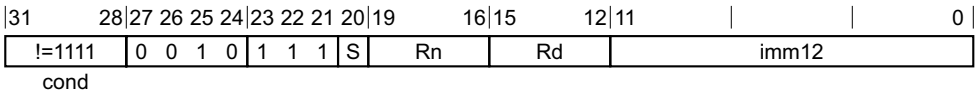
Reverse Subtract with Carry (immediate) subtracts a register value and the value of NOT (Carry flag) from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



RSC variant

Applies when S == 0.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

RSCS variant

Applies when S == 1.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the RSCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

<Rn> Is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

F5.1.166 RSC, RSCS (register)

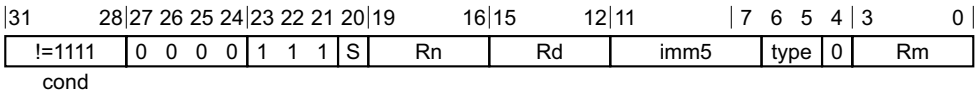
Reverse Subtract with Carry (register) subtracts a register value and the value of NOT (Carry flag) from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



RSC, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSC, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

RSCS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSCS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the RSCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, PSTATE.C);
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

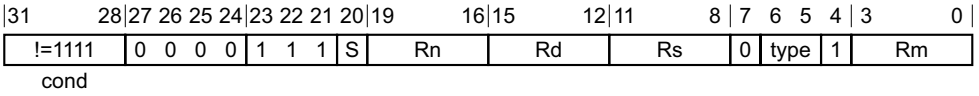
F5.1.167 RSC, RSCS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value and the value of NOT (Carry flag) from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

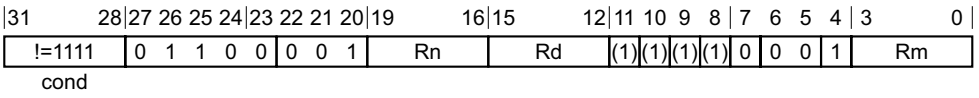
F5.1.168 SADD16

Signed Add 16 performs two 16-bit signed integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

A1



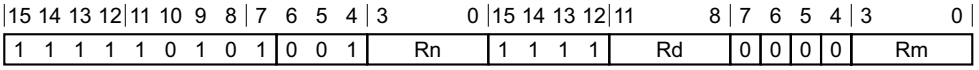
A1 variant

```
SADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.

F5.1.171 SBC, SBCS (immediate)

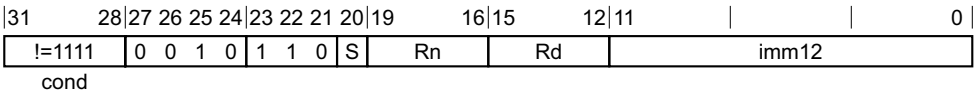
Subtract with Carry (immediate) subtracts an immediate value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



SBC variant

Applies when S == 0.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

SBCS variant

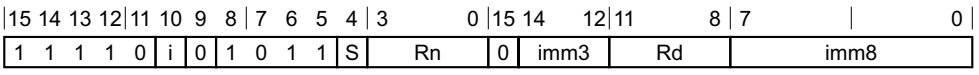
Applies when S == 1.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



SBC variant

Applies when S == 0.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

SBCS variant

Applies when S == 1.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.172 SBC, SBCS (register)

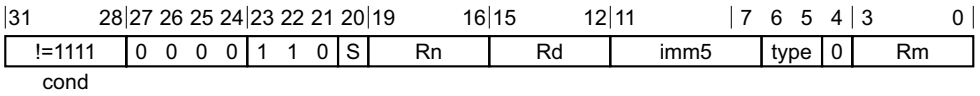
Subtract with Carry (register) subtracts an optionally-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



SBC, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && type == 11`.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SBC, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && type == 11)`.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

SBCS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && type == 11`.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SBCS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && type == 11)`.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

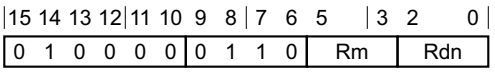
Non-Confidential - Beta

T1



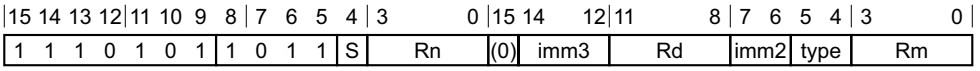
T1 variant

```
SBC<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
SBCS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



SBC, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SBC, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
SBC<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

SBCS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && imm2 == 00 && type == 11`.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SBCS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
SBCS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

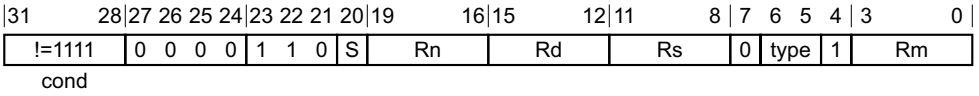
F5.1.173 SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

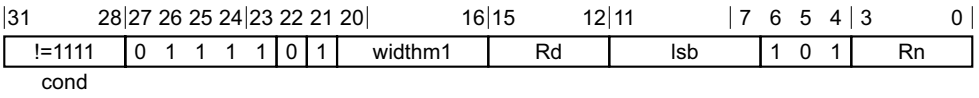
F5.1.174 SBFX

Signed Bit Field Extract extracts any number of adjacent bits at any position from a register, sign-extends them to 32 bits, and writes the result to the destination register.

A1



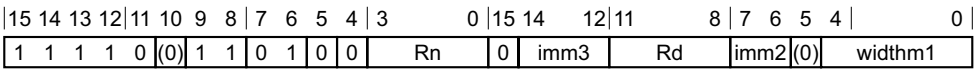
A1 variant

```
SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(lsb);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(imm3:imm2);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *SBFX* on page K1-5321.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<lsb>	For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field. For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.

Operation for all encodings

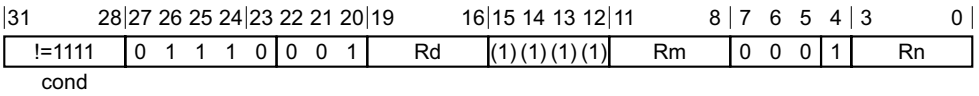
```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsbit + widthminus1;
    if msbit <= 31 then
        R[d] = SignExtend(R[n]<msbit:lsbit>, 32);
    else
        UNPREDICTABLE;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.175 SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the result to the destination register. The condition flags are not affected.

A1



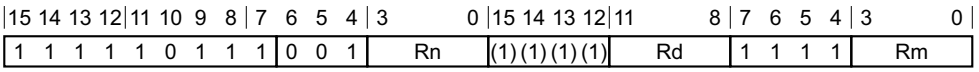
A1 variant

```
SDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *SDIV* on page K1-5322.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Overflow

If the signed integer division `0x80000000` / `0xFFFFFFFF` is performed, the pseudocode produces the intermediate integer result $+2^{31}$, that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to <Rd> must be the bottom 32 bits of the binary representation of $+2^{31}$. So the result of the division is `0x80000000`.

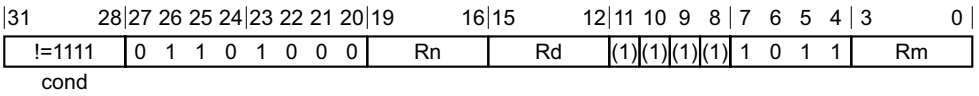
F5.1.176 SEL

Select Bytes selects each byte of its result from either its first operand or its second operand, according to the values of the PSTATE.GE flags.

A1



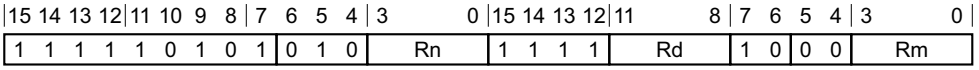
A1 variant

```
SEL{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SEL{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    R[d]<7:0>   = if PSTATE.GE<0> == '1' then R[n]<7:0>   else R[m]<7:0>;

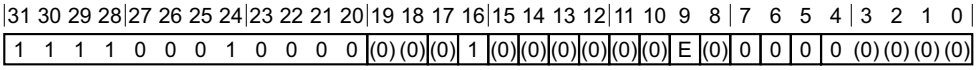
F5.1.177 SETEND

Set Endianness writes a new value to PSTATE.E.

A1



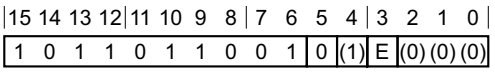
A1 variant

```
SETEND{<q>} <endian_specifier> // Cannot be conditional
```

Decode for this encoding

```
set_bigend = (E == '1');
```

T1



T1 variant

```
SETEND{<q>} <endian_specifier> // Not permitted in IT block
```

Decode for this encoding

```
set_bigend = (E == '1');
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2322.

<endian_specifier> Is the endianness to be selected, and the value to be set in PSTATE.E, encoded in the "E" field. It can have the following values:

LE when E = 0

BE when E = 1

Operation for all encodings

```
EncodingSpecificOperations();
AArch32.CheckSETENDEnabled();
PSTATE.E = if set_bigend then '1' else '0';
```

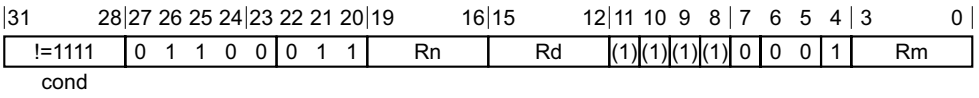
F5.1.180 SHADD16

Signed Halving Add 16 performs two signed 16-bit integer additions, halves the results, and writes the results to the destination register.

A1



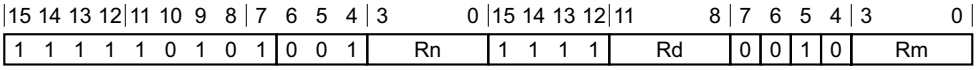
A1 variant

```
SHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

F5.1.186 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see *Secure Monitor Call (SMC) exception* on page G1-3712.

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.

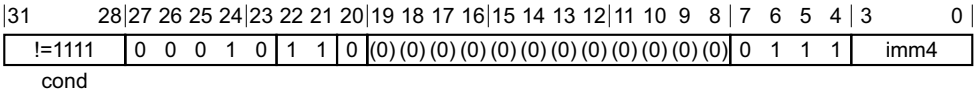
If the values of HCR.TSC and SCR.SCD are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the SCR_EL3.SMD bit, rather than the SCR.SCD bit, that can change the effect of executing an SMC instruction.

If the value of HCR.TSC is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of SCR.SCD. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see *Traps to Hyp mode of Non-secure EL1 execution of SMC instructions* on page G1-3758.

If the value of HCR.TSC is 0 and the value of SCR.SCD is 1, the SMC instruction is:

- UNDEFINED in Non-secure state.
- CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

A1



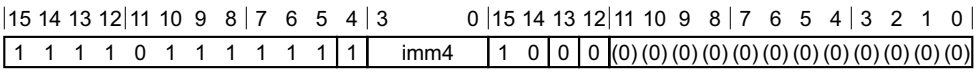
A1 variant

```
SMC{<c>}{<q>} {#}<imm4>
```

Decode for this encoding

```
// imm4 is for assembly/disassembly only and is ignored by hardware
```

T1



T1 variant

```
SMC{<c>}{<q>} {#}<imm4>
```

Decode for this encoding

```
// imm4 is for assembly/disassembly only and is ignored by hardware
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<imm4> Is a 4-bit unsigned immediate value, in the range 0 to 15, encoded in the "imm4" field. This is ignored by the PE. The Secure Monitor Call exception handler (Secure Monitor code) can use this value to determine what service is being requested, but ARM does not recommend this.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    if !HaveEL(EL3) || PSTATE.EL == EL0 then
        UNDEFINED;

    AArch32.CheckForSMCTrap();

    if !ELUsingAArch32(EL3) then
        if SCR_EL3.SMD == '1' then
            // SMC disabled.
            UNDEFINED;
    else
        if SCR.SCD == '1' then
            // SMC disabled
            if IsSecure() then
                // Executes either as a NOP or UNALLOCATED.
                c = ConstrainUnpredictable(Unpredictable_SMD);
                assert c IN {Constraint_NOP, Constraint_UNDEF};
                if c == Constraint_NOP then EndOfInstruction();
            UNDEFINED;

    if !ELUsingAArch32(EL3) then
        AArch64.CallSecureMonitor(Zeros(16));
    else
        AArch32.TakeSMCException();
```

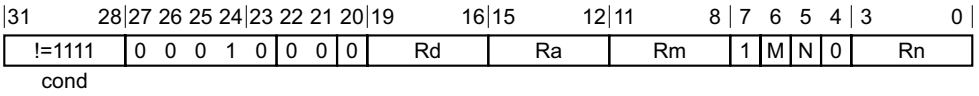
F5.1.187 SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. It is not possible for overflow to occur during the multiplication.

A1



SMLABB variant

Applies when `M == 0 && N == 0`.

```
SMLABB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

SMLABT variant

Non-Confidential - Beta

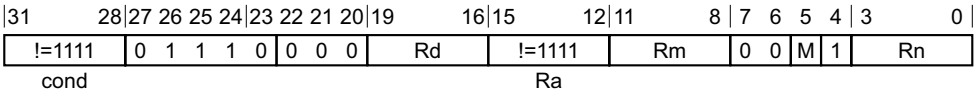
F5.1.188 SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets PSTATE.Q to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

A1



SMLAD variant

Applies when `M == 0`.

```
SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

SMLADX variant

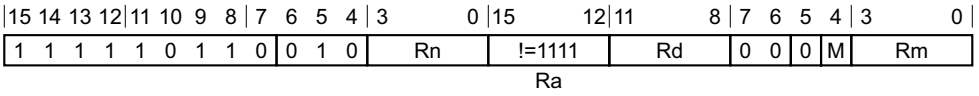
Applies when `M == 1`.

```
SMLADX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for all variants of this encoding

```
if Ra == '1111' then SEE SMUAD;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



SMLAD variant

Applies when `M == 0`.

```
SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

SMLADX variant

Applies when `M == 1`.

```
SMLADX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for all variants of this encoding

```
if Ra == '1111' then SEE SMUAD;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

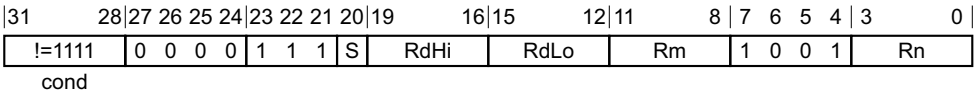
F5.1.189 SMLAL, SMLALS

Signed Multiply Accumulate Long multiplies two signed 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1



Flag setting variant

Applies when `S == 1`.

```
SMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Not flag setting variant

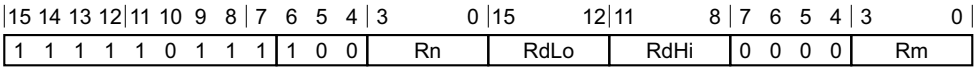
Applies when `S == 0`.

```
SMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

T1



T1 variant

```
SMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *SMLAL* on page K1-5322.

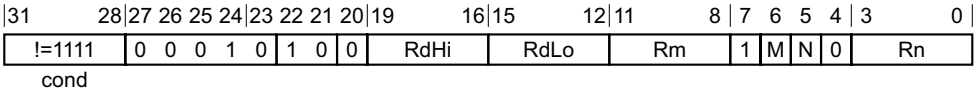
F5.1.190 SMLALBB, SMLALBT, SMLALTB, SMLALTT

Signed Multiply Accumulate Long (halfwords) multiplies two signed 16-bit values to produce a 32-bit value, and accumulates this with a 64-bit value. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is sign-extended and accumulated with a 64-bit accumulate value.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^{64}.

A1



SMLALBB variant

Applies when `M == 0 && N == 0`.

```
SMLALBB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

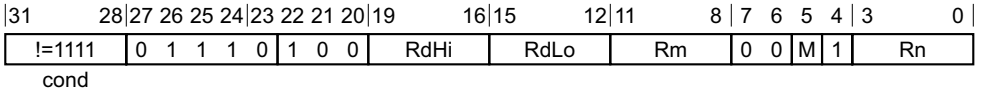
F5.1.191 SMLALD, SMLALDX

Signed Multiply Accumulate Long Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 64-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^{64}.

A1



SMLALD variant

Applies when `M == 0`.

```
SMLALD{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

SMLALDX variant

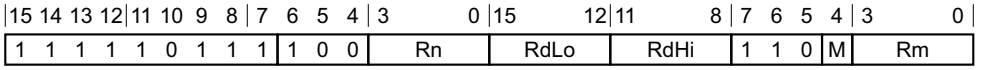
Applies when `M == 1`.

```
SMLALDX{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

T1



SMLALD variant

Applies when `M == 0`.

```
SMLALD{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

SMLALDX variant

Applies when `M == 1`.

```
SMLALDX{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

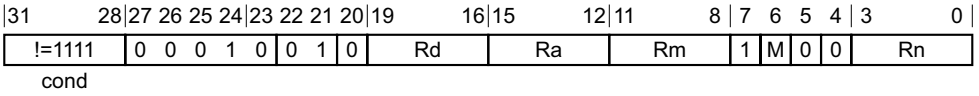
F5.1.192 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. No overflow can occur during the multiplication.

A1



SMLAWB variant

Applies when `M == 0`.

```
SMLAWB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

SMLAWT variant

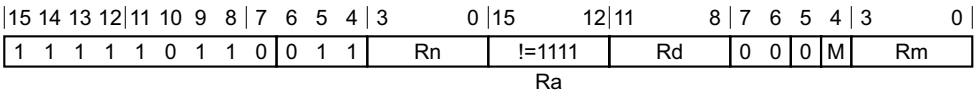
Applies when `M == 1`.

```
SMLAWT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1



SMLAWB variant

Applies when `M == 0`.

```
SMLAWB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

SMLAWT variant

Applies when `M == 1`.

```
SMLAWT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

Decode for all variants of this encoding

```
if Ra == '1111' then SEE SMULWB, SMULWT;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

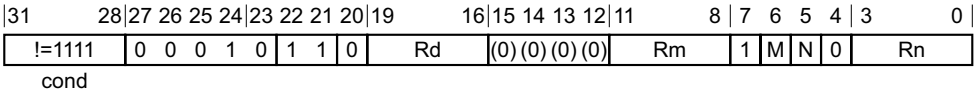
F5.1.199 SMULBB, SMULBT, SMULTB, SMULTT

Signed Multiply (halfwords) multiplies two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is written to the destination register. No overflow is possible during this instruction.

A1



SMULBB variant

Applies when `M == 0 && N == 0`.

```
SMULBB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULBT variant

Applies when `M == 1 && N == 0`.

```
SMULBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULTB variant

Applies when `M == 0 && N == 1`.

```
SMULTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULTT variant

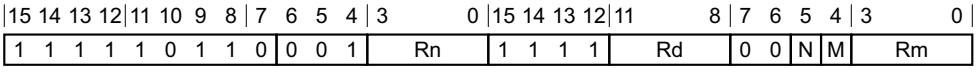
Applies when `M == 1 && N == 1`.

```
SMULTT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
n_high = (N == '1');  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



SMULBB variant

Applies when `N == 0 && M == 0`.

```
SMULBB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULBT variant

Applies when `N == 0 && M == 1`.

```
SMULBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

SMULTB variant

Applies when `N == 1 && M == 0`.

```
SMULTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULTT variant

Applies when `N == 1 && M == 1`.

```
SMULTT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
n_high = (N == '1');  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;
    operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
    result = SInt(operand1) * SInt(operand2);
    R[d] = result<31:0>;
    // Signed overflow cannot occur
```

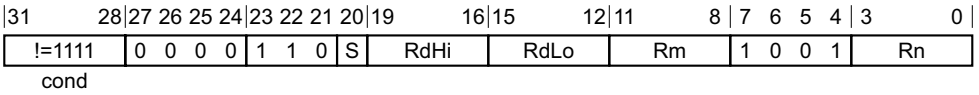
Non-Confidential - Beta

F5.1.200 SMULL, SMULLS

Signed Multiply Long multiplies two 32-bit signed values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1



Flag setting variant

Applies when `S == 1`.

```
SMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Not flag setting variant

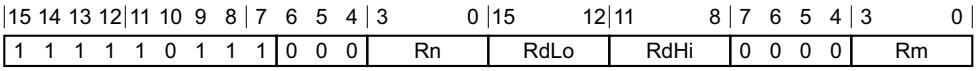
Applies when `S == 0`.

```
SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

T1



T1 variant

```
SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *SMULL* on page K1-5323.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

Non-Confidential - Beta

<RdLo> Is the general-purpose destination register for the lower 32 bits of the result, encoded in the "RdLo" field.

<RdHi> Is the general-purpose destination register for the upper 32 bits of the result, encoded in the "RdHi" field.

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then
        PSTATE.N = result<63>;
        PSTATE.Z = IsZeroBit(result<63:0>);
        // PSTATE.C, PSTATE.V unchanged
```

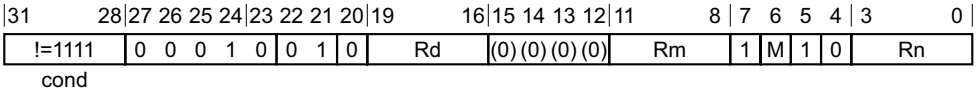
Non-Confidential - Beta

F5.1.201 SMULWB, SMULWT

Signed Multiply (word by halfword) multiplies a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are written to the destination register. The bottom 16 bits of the 48-bit product are ignored. No overflow is possible during this instruction.

A1



SMULWB variant

Applies when `M == 0`.

```
SMULWB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULWT variant

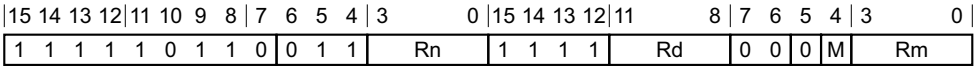
Applies when `M == 1`.

```
SMULWT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



SMULWB variant

Applies when `M == 0`.

```
SMULWB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMULWT variant

Applies when `M == 1`.

```
SMULWT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential - Beta

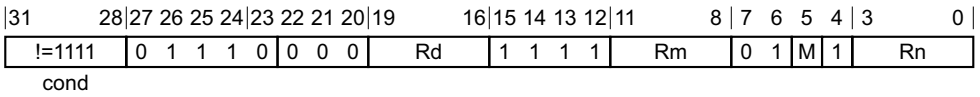
F5.1.202 SMUSD, SMUSDX

Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It subtracts one of the products from the other, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow cannot occur.

A1



SMUSD variant

Applies when `M == 0`.

```
SMUSD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMUSDX variant

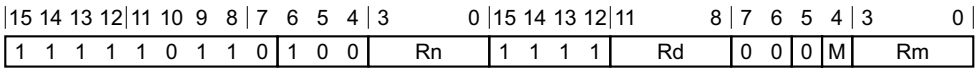
Applies when `M == 1`.

```
SMUSDX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



SMUSD variant

Applies when `M == 0`.

```
SMUSD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

SMUSDX variant

Applies when `M == 1`.

```
SMUSDX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

F5.1.203 SRS, SRSDA, SRSDB, SRSIA, SRSIB

Store Return State stores the LR_<current_mode> and SPSR_<current_mode> to the stack of a specified mode. For information about memory accesses see *Memory accesses* on page F2-2327.

SRS is UNDEFINED in Hyp mode.

SRS is UNPREDICTABLE if it is executed in User or System mode, or if the specified mode is any of the following:

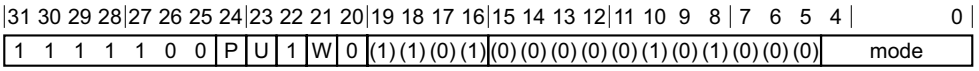
- Not implemented.
- A mode that Table G1-2 on page G1-3654 does not show.
- Not accessible from the context that the SRS instruction is executed in, as follows:
  - A mode that is at a higher Exception level.
  - When executing in Non-secure state, Monitor mode.

SRS is trapped to EL3 if all of the following are true:

- It is executed at Secure PL1.
- The specified mode is monitor mode.
- EL3 is using AArch64.

See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-1519.

A1



Decrement After variant

Applies when P == 0 && U == 0.

```
SRSDA{<c>}{<q>} SP{!}, #<mode>
```

Decrement Before variant

Applies when P == 1 && U == 0.

```
SRSDB{<c>}{<q>} SP{!}, #<mode>
```

Increment After variant

Applies when P == 0 && U == 1.

```
SRS{IA}{<c>}{<q>} SP{!}, #<mode>
```

Increment Before variant

Applies when P == 1 && U == 1.

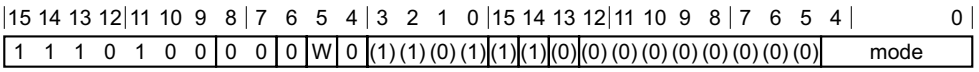
```
SRSIB{<c>}{<q>} SP{!}, #<mode>
```

Decode for all variants of this encoding

```
wback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T1



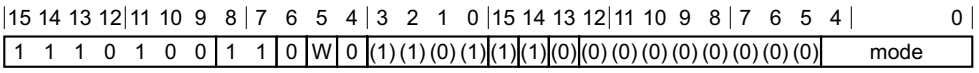
T1 variant

```
SRSDB{<c>}{<q>} SP{!}, #<mode>
```

Decode for this encoding

```
wback = (W == '1');  increment = FALSE;  wordhigher = FALSE;
```

T2



T2 variant

```
SRS{IA}{<c>}{<q>} SP{!}, #<mode>
```

Decode for this encoding

```
wback = (W == '1');  increment = TRUE;  wordhigher = FALSE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *SRS (T32)* on page K1-5348 and *SRS (A32)* on page K1-5349.

Assembler symbols

`IA`	For encoding A1: is an optional suffix to indicate the Increment After variant. For encoding T2: is an optional suffix for the Increment After form.
`<c>`	For encoding A1: see *Standard assembler syntax fields* on page F2-2322. `<c>` must be `AL` or omitted. For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2322.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`!`	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
`<mode>`	Is the number of the mode whose Banked SP is used as the base register, encoded in the "mode" field. For details of PE modes and their numbers see *AArch32 PE mode descriptions* on page G1-3654.

`SRSFA`, `SRSEA`, `SRSFD`, and `SRSED` are pseudo-instructions for `SRSIB`, `SRSIA`, `SRSDB`, and `SRSDA` respectively, referring to their use for pushing data onto Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

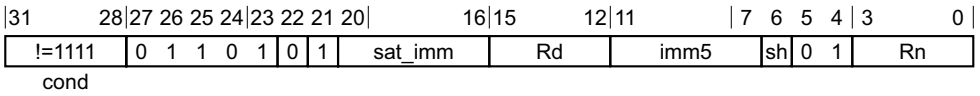
F5.1.204 SSAT

Signed Saturate saturates an optionally-shifted signed value to a selectable signed range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

A1



Arithmetic shift right variant

Applies when `sh == 1`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

Logical shift left variant

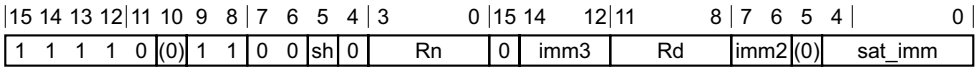
Applies when `sh == 0`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1



Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

Logical shift left variant

Applies when `sh == 0`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '00000' then SEE SSAT16;
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential - Beta

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the bit position for saturation, in the range 1 to 32, encoded in the "sat_imm" field as <imm>-1.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<amount>	For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field. For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C);  // PSTATE.C ignored
    (result, sat) = SignedSatQ(SInt(operand), saturate_to);
    R[d] = SignExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

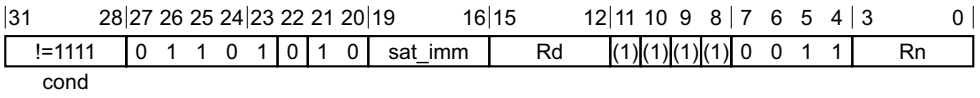
F5.1.205 SSAT16

Signed Saturate 16 saturates two signed 16-bit values to a selected signed range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

A1



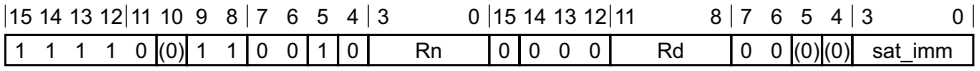
A1 variant

```
SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.

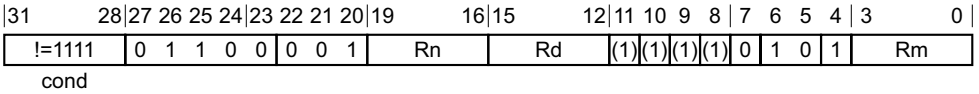
F5.1.206 SSAX

Signed Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer subtraction and one 16-bit addition, and writes the results to the destination register. It sets PSTATE.GE according to the results.

A1



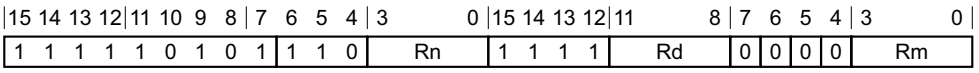
A1 variant

```
SSAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SSAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum  = SInt(R[n]<15:0>) + SInt(R[m]<31:16>);
    diff = SInt(R[n]<31:16>) - SInt(R[m]<15:0>);

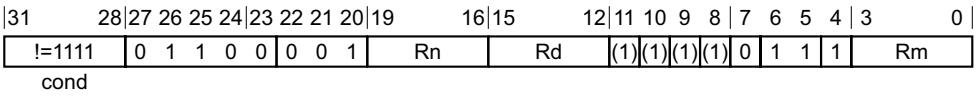
F5.1.207 SSUB16

Signed Subtract 16 performs two 16-bit signed integer subtractions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the subtractions.

A1



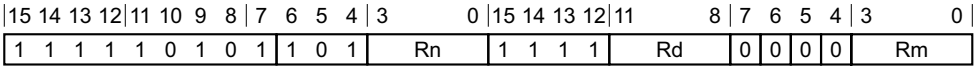
A1 variant

```
SSUB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SSUB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    diff1 = SInt(R[n]<15:0>) - SInt(R[m]<15:0>);
    diff2 = SInt(R[n]<31:16>) - SInt(R[m]<31:16>);
    R[d]<15:0>  = diff1<15:0>;
```

F5.1.209 STC, STC2

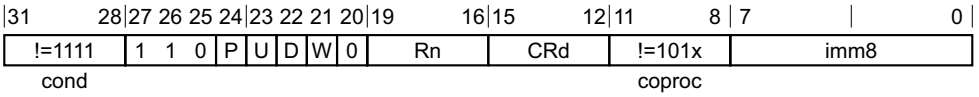
Store Coprocessor stores data from a conceptual coprocessor to a sequence of consecutive memory addresses.

This is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the imm8, CRd, and D field values that are valid STC and STC2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2229 and *General behavior of System registers* on page G4-4002.

In an implementation that includes EL2, the permitted STC access to a system control register can be trapped to Hyp mode, meaning that an attempt to execute an STC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *Trapping general Non-secure System register accesses to debug registers* on page G1-3768.

For simplicity, the STC pseudocode does not show this possible trap to Hyp mode.

A1



Offset variant

Applies when P == 1 && W == 0.

```
STC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>{, #{+/-}<imm>}]
```

Post-indexed variant

Applies when P == 0 && W == 1.

```
STC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when P == 1 && W == 1.

```
STC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>, #{+/-}<imm>]!
```

Unindexed variant

Applies when P == 0 && U == 1 && W == 0.

```
STC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>], <option>
```

Decode for all variants of this encoding

```

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STC, STC2* on page K1-5324.

Advanced SIMD and floating-point: See *Floating-point and Advanced SIMD load/store and 64-bit register moves* on page F3-2362 for the T32 instruction set, or *Floating-point and Advanced SIMD load/store and 64-bit register moves* on page F4-2445 for the A32 instruction set.

Assembler symbols

L	If specified, selects the D == 1 form of the encoding. If omitted, selects the D == 0 form.
<c>	For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2322. For encoding A2: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2322.

<coproc> Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.

<CRd> Is the coprocessor register to be transferred, encoded in the "CRd" field.

<Rn> For encoding A1, A2: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding A1, A2, T1, T2: is the general-purpose base register, encoded in the "Rn" field.

<option> Is a coprocessor option, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

<imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    repeat
        MemA[address,4] = Coproc_GetWordToStore(cp, ThisInstr());
        address = address + 4;
    until Coproc_DoneStoring(cp, ThisInstr());
    if wback then R[n] = offset_addr;
```

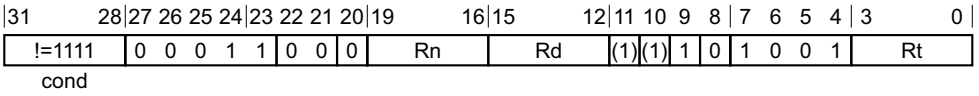
F5.1.212 STLEX

Store-Release Exclusive Word stores a word from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



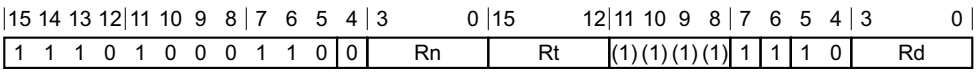
A1 variant

```
STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

T1



T1 variant

```
STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemO[address, 4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

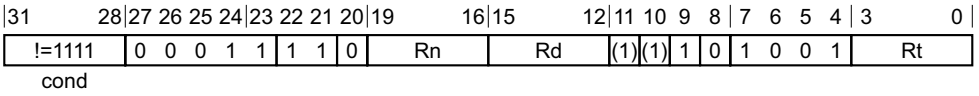
F5.1.215 STLEXH

Store-Release Exclusive Halfword stores a halfword from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



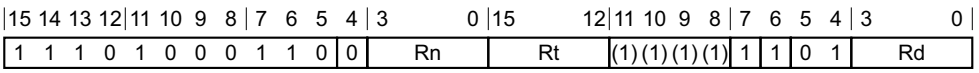
A1 variant

```
STLEXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

T1



T1 variant

```
STLEXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated
- `<Rd>` is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
        MemO[address, 2] = R[t]<15:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

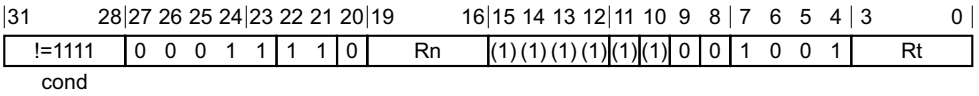
F5.1.216 STLH

Store-Release Halfword stores a halfword from a register to memory. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



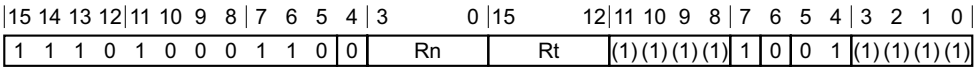
A1 variant

```
STLH{<c>}{<q>} <Rt>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
STLH{<c>}{<q>} <Rt>, [<Rn>]
```

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    MemO[address, 2] = R[t]<15:0>;
```

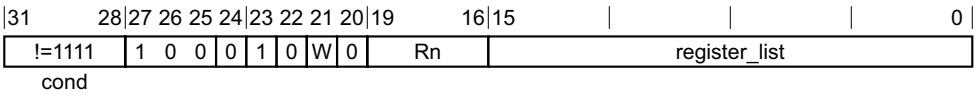
F5.1.217 STM, STMIA, STMEA

Store Multiple (Increment After, Empty Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

For details of related system instructions see STM (User registers).

A1



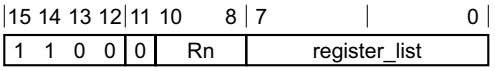
A1 variant

```
STM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

T1



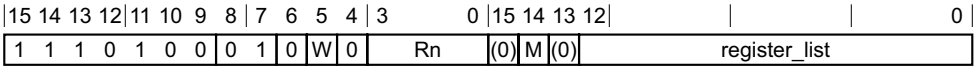
T1 variant

```
STM{IA}{<c>}{<q>} <Rn>!, <registers> // Preferred syntax
STMEA{<c>}{<q>} <Rn>!, <registers> // Alternate syntax, Empty Ascending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = '00000000':register_list;  wback = TRUE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

T2



T2 variant

```
STM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented
in T1
STMEA{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack, if <Rn>, '!' and
<registers> can be represented in T1
STM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
n = UInt(Rn);  registers = '0':M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STM (STMIA, STMEA)* on page K1-5326.

Assembler symbols

IA	Is an optional suffix for the Increment After form.
<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register. For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register. For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encodings T1 and A1
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then  // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);
```

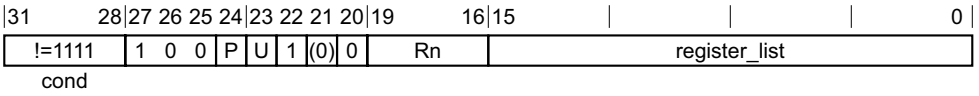
Non-Confidential - Beta

F5.1.218 STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to consecutive memory locations using an address from a base register. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System modes.

A1



A1 variant

```
STM{<amode>}{<c>}{<q>} <Rn>, <registers>^
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  increment = (U == '1');  wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STM (User registers)* on page K1-5349.

Assembler symbols

<amode> is one of:

DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
ED	Empty Descending. For this instruction, a synonym for DA.
DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
FD	Full Descending. For this instruction, a synonym for DB.
IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
EA	Empty Ascending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
FA	Full Ascending. For this instruction, a synonym for IB.

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<registers> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be stored by the STM instruction. The registers are stored with the lowest-numbered register to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then  // Store User mode register
                MemA[address,4] = Rmode[i, M32_User];
                address = address + 4;
        if registers<15> == '1' then
            MemA[address,4] = PCStoreValue();
```

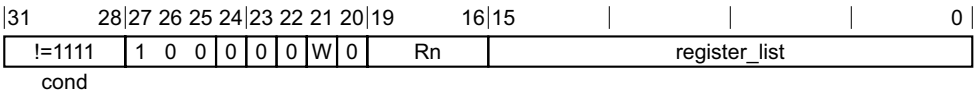
F5.1.219 STMDA, STMED

Store Multiple Decrement After (Empty Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

For details of related system instructions see STM (User registers).

A1



A1 variant

```
STMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STMDA (STMED)* on page K1-5328.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
            address = address + 4;
```

F5.1.220 STMDB, STMFD

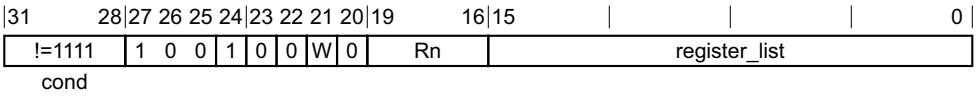
Store Multiple Decrement Before (Full Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the first of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2328.

For details of related system instructions see STM (User registers).

This instruction is used by the alias PUSH (multiple registers). See the *Alias conditions* on page F5-2948 table for details of when each alias is preferred.

A1



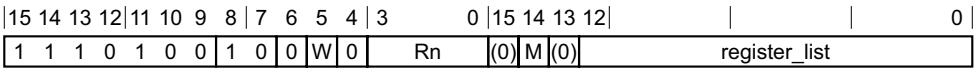
A1 variant

```
STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

T1



T1 variant

```
STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

Decode for this encoding

```
n = UInt(Rn);  registers = '0':M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STMDB (STMFD)* on page K1-5327.

Non-Confidential - Beta

Alias conditions

Alias	is preferred when
PUSH (multiple registers)	`W == '1' && Rn == '1101' && BitCount(register_list) > 1`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`!` The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

`<registers>` For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encoding A1
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then  // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
```

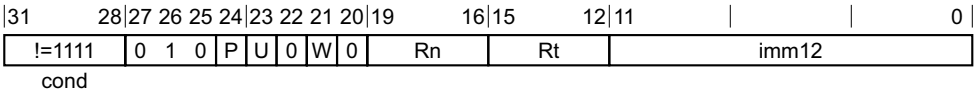
F5.1.222 STR (immediate)

Store Register (immediate) calculates an address from a base register value and an immediate offset, and stores a word from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

This instruction is used by the alias PUSH (single register). See the *Alias conditions* on page F5-2953 table for details of when each alias is preferred.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

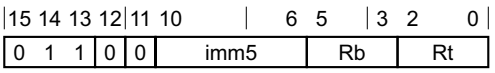
Applies when `P == 1 && W == 1`.

```
STR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

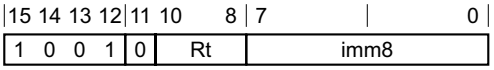
```
STR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



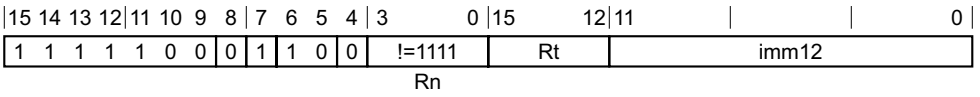
T2 variant

```
STR{<c>}{<q>} <Rt>, [SP{, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = 13;  imm32 = ZeroExtend(imm8:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T3



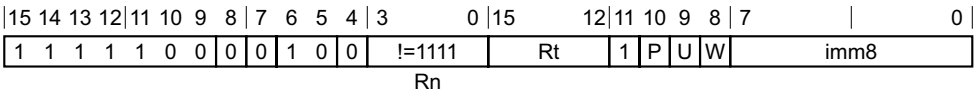
T3 variant

```
STR{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
STR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
if t == 15 then UNPREDICTABLE;
```

T4



Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
STR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE STRT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STR (immediate, T32)* on page K1-5330 and *STR (immediate, A32)* on page K1-5329.

Alias conditions

Alias	of variant	is preferred when
PUSH (single register)	A1 (pre-indexed)	`P == '1' && U == '0' && W == '1' && Rn == '1101' && imm12 == '000000000100'`
PUSH (single register)	T4 (pre-indexed)	`Rn == '1101' && U == '0' && imm8 == '00000100'`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1, T2, T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1 and T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.

For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,4] = if t == 15 then PCStoreValue() else R[t];
        if wback then R[n] = offset_addr;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,4] = R[t];
        if wback then R[n] = offset_addr;
```

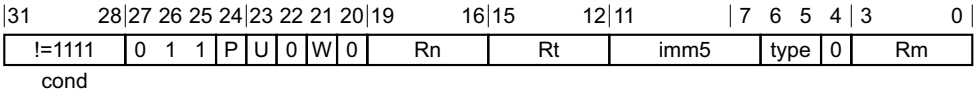
F5.1.223 STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, stores a word from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed variant

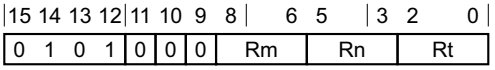
Applies when `P == 1 && W == 1`.

```
STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

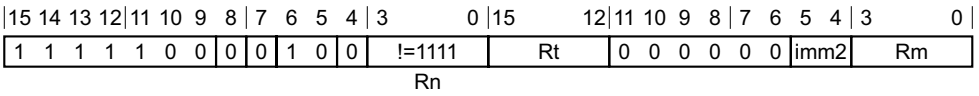
```
STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
STR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STR (register)* on page K1-5331.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
```

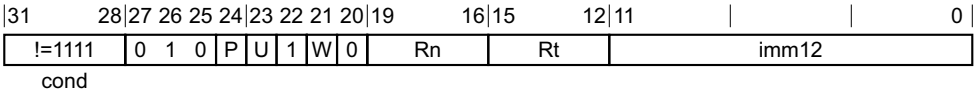
F5.1.224 STRB (immediate)

Store Register Byte (immediate) calculates an address from a base register value and an immediate offset, and stores a byte from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRB{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

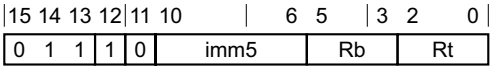
Applies when `P == 1 && W == 1`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRBT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



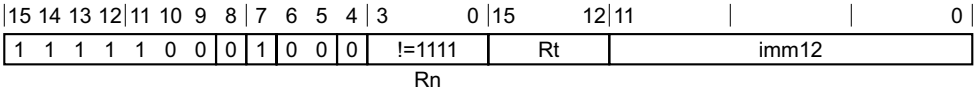
T1 variant

```
STRB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T2



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

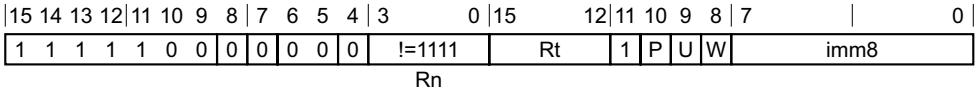
T2 variant

```
STRB{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
STRB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T3



Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
STRB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE STRBT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRB (immediate), T32* on page K1-5332 and *STRB (immediate, A32)* on page K1-5332.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.

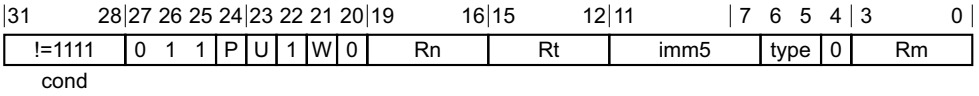
F5.1.225 STRB (register)

Store Register Byte (register) calculates an address from a base register value and an offset register value, and stores a byte from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed variant

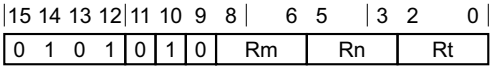
Applies when `P == 1 && W == 1`.

```
STRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRBT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

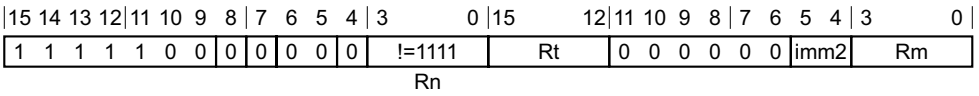
```
STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
STRB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRB (register)* on page K1-5333.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<Rt>`	Is the general-purpose register to be transferred, encoded in the "Rt" field.
`<Rn>`	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-`	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
	`-` when `U = 0`
	`+` when `U = 1`

`+`	Specifies the index register is added to the base register.
`<Rm>`	Is the general-purpose index register, encoded in the "Rm" field.
`<shift>`	The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.
`<imm>`	If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
```

Non-Confidential - Beta

F5.1.226 STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see *Memory accesses* on page F2-2327.

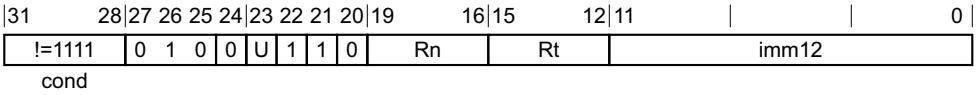
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1



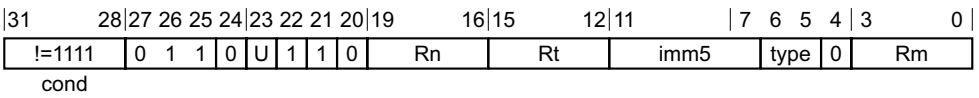
A1 variant

```
STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

A2



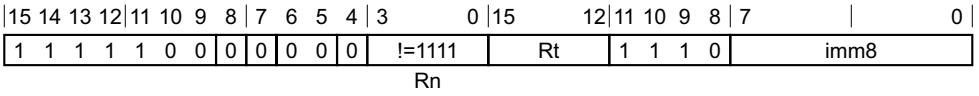
A2 variant

```
STRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
STRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRBT* on page K1-5334.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,1] = R[t]<7:0>;
    if postindex then R[n] = offset_addr;
```

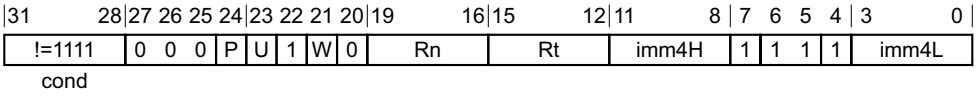
F5.1.227 STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

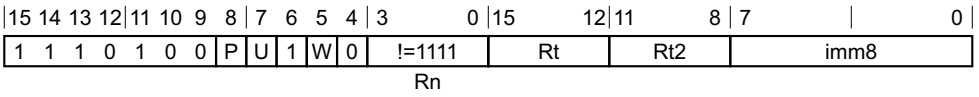
Applies when `P == 1 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
```

T1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if n == 15 || t == 15 || t2 == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRD (immediate)* on page K1-5334.

Related encodings: Load/store dual, load/store exclusive, table branch.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        bits(64) data;
        if BigEndian() then
            data<63:32> = R[t];
            data<31:0> = R[t2];
        else
            data<31:0> = R[t];
            data<63:32> = R[t2];
        MemA[address,8] = data;
    else
        MemA[address,4] = R[t];
        MemA[address+4,4] = R[t2];
    if wback then R[n] = offset_addr;
```

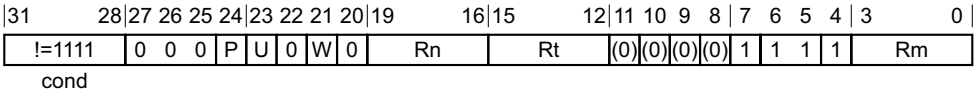
F5.1.228 STRD (register)

Store Register Dual (register) calculates an address from a base register value and a register offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!
```

Decode for all variants of this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRD (register)* on page K1-5336.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

`<Rt2>` Is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        bits(64) data;
        if BigEndian() then
            data<63:32> = R[t];
            data<31:0> = R[t2];
        else
            data<31:0> = R[t];
            data<63:32> = R[t2];
        MemA[address,8] = data;
    else
        MemA[address,4] = R[t];
        MemA[address+4,4] = R[t2];
    if wback then R[n] = offset_addr;
```

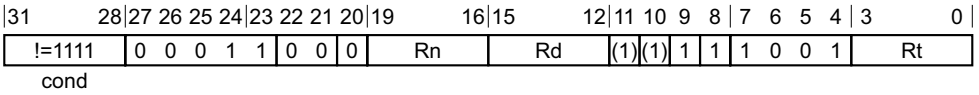
F5.1.229 STREX

Store Register Exclusive calculates an address from a base register value and an immediate offset, stores a word from a register to the calculated address if the PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



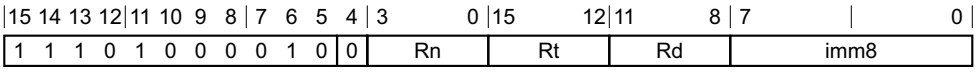
A1 variant

```
STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, {#}<imm>}]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

T1



T1 variant

```
STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, #<imm>}]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STREX* on page K1-5337.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<imm> For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.

For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemA[address,4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

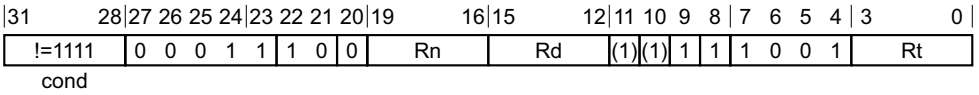
Non-Confidential - Beta

F5.1.230 STREXB

Store Register Exclusive Byte derives an address from a base register value, stores a byte from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



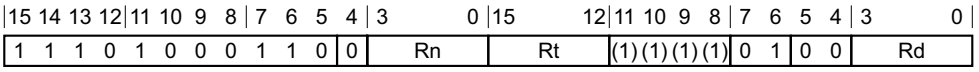
A1 variant

```
STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

T1



T1 variant

```
STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STREXB* on page K1-5337.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemA[address,1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

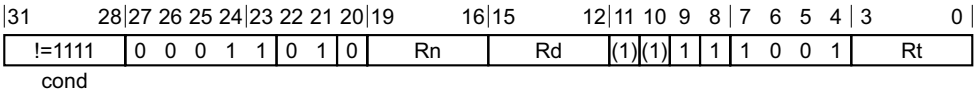
F5.1.231 STREXD

Store Register Exclusive Doubleword derives an address from a base register value, stores a 64-bit doubleword from two registers to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



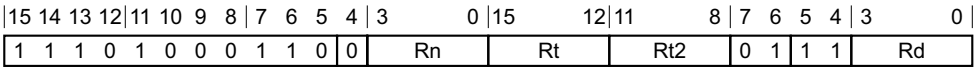
A1 variant

```
STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

T1



T1 variant

```
STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STREXD* on page K1-5338.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rd> must not be the same as <Rn>, <Rt>, or <Rt2>.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value;  R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

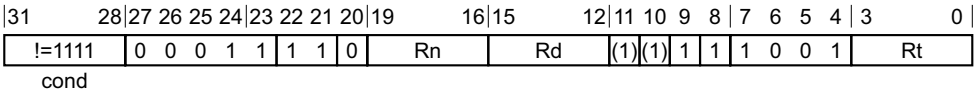
F5.1.232 STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2271. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



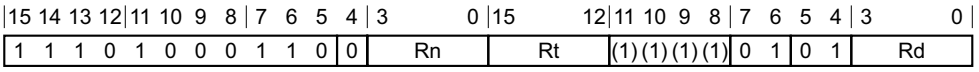
A1 variant

```
STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

T1



T1 variant

```
STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STREXH* on page K1-5338.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
        MemA[address,2] = R[t]<15:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

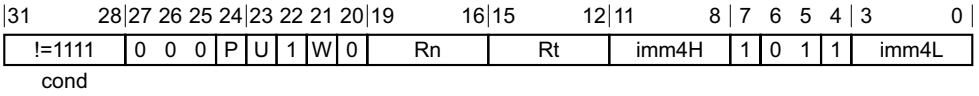
F5.1.233 STRH (immediate)

Store Register Halfword (immediate) calculates an address from a base register value and an immediate offset, and stores a halfword from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

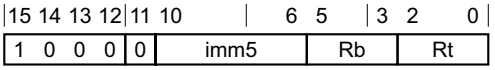
Applies when `P == 1 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRHT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



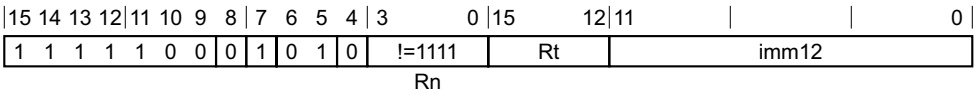
T1 variant

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'0', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T2



Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

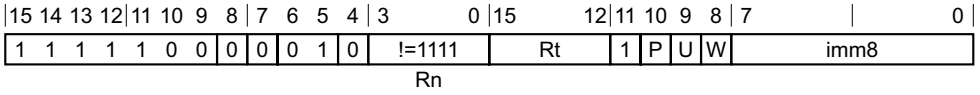
T2 variant

```
STRH{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T3



Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE STRHT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRH (immediate, T32)* on page K1-5339 and *STRH (immediate, A32)* on page K1-5339.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding A1, T1, T2, T3: is the general-purpose base register, encoded in the "Rn" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

+ when `U = 1`

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,2] = R[t]<15:0>;
        if wback then R[n] = offset_addr;
else

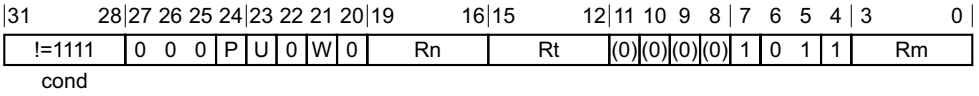
Non-Confidential - Beta

F5.1.234 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a register to memory. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see *Memory accesses* on page F2-2327.

A1



Offset variant

Applies when `P == 1 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

Pre-indexed variant

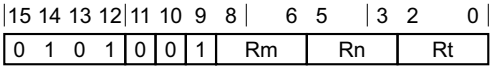
Applies when `P == 1 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRHT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRType_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

T1



T1 variant

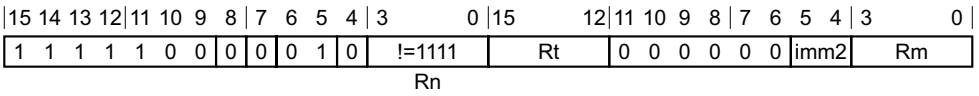
```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



T2 variant

```
STRH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
STRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRH (register)* on page K1-5340.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
```

F5.1.235 STRHT

Store Register Halfword Unprivileged stores a halfword from a register to memory. For information about memory accesses see *Memory accesses* on page F2-2327.

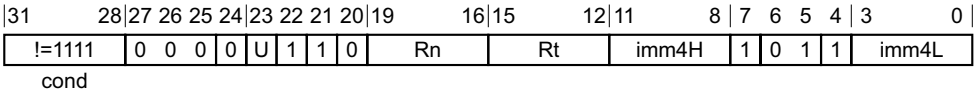
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1



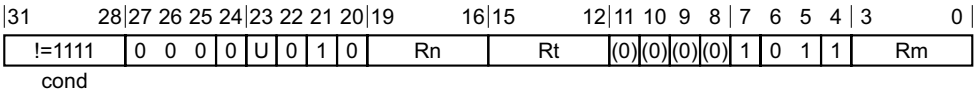
A1 variant

```
STRHT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

A2



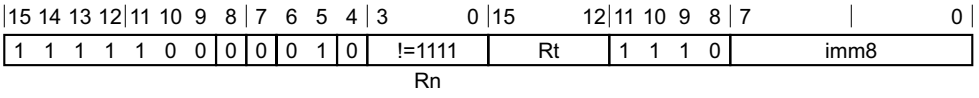
A2 variant

```
STRHT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
STRHT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRHT* on page K1-5341.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,2] = R[t]<15:0>;
    if postindex then R[n] = offset_addr;
```

F5.1.236 STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see *Memory accesses* on page F2-2327.

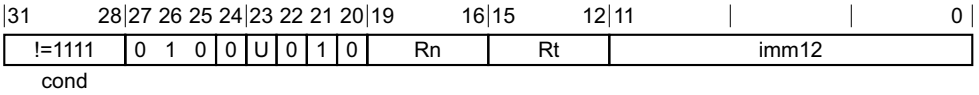
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1



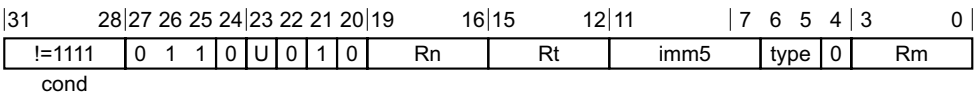
A1 variant

```
STRT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if n == 15 || n == t then UNPREDICTABLE;
```

A2



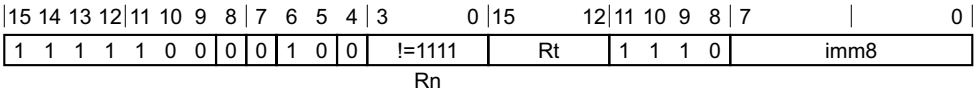
A2 variant

```
STRT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(type, imm5);
if n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
STRT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STRT* on page K1-5342.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rt>` For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-2325.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    if t == 15 then  // Only possible for encodings A1 and A2
        data = PCStoreValue();
    else
        data = R[t];
    MemU_unpriv[address,4] = data;
    if postindex then R[n] = offset_addr;
```

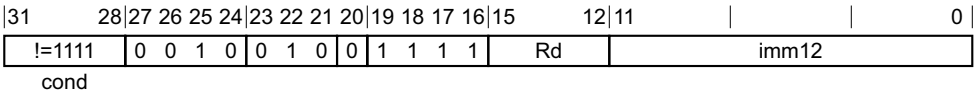
F5.1.237 SUB (immediate, from PC)

Subtract from PC subtracts an immediate value from the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias.

This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

A2



A2 variant

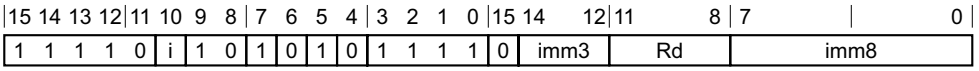
```
SUB{<c>}{<q>} <Rd>, PC, #<const>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is the preferred disassembly when `imm12==000000000000`.

T2



T2 variant

```
SUB{<c>}{<q>} <Rd>, PC, #<imm12>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is the preferred disassembly when `i:imm3:imm8 = '000000000000'`.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

`<label>` For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-2337.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` An immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

Operation for all encodings

The description of ADR gives the operational pseudocode for this instruction.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.238 SUB, SUBS (immediate)

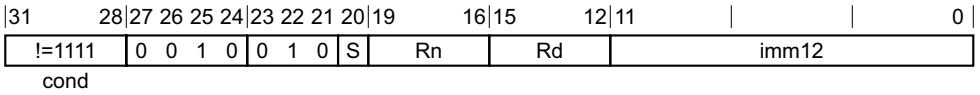
Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



SUB variant

Applies when S == 0 && Rn != 11x1.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

SUBS variant

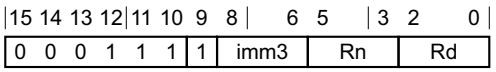
Applies when S == 1 && Rn != 1101.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rn == '1111' && S == '0' then SEE ADR;
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



T1 variant

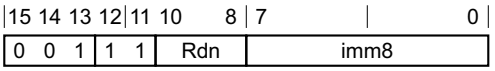
```
SUB<c>{<q>} <Rd>, <Rn>, #<imm3> // Inside IT block
SUBS{<q>} <Rd>, <Rn>, #<imm3> // Outside IT block
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm3, 32);
```

T2



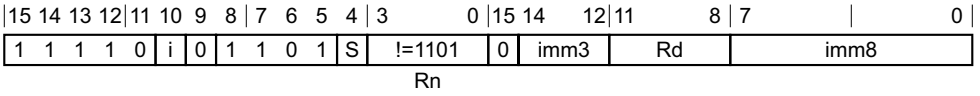
T2 variant

```
SUB<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
SUB<c>{<q>} {<Rdn>,} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
SUBS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
SUBS{<q>} {<Rdn>,} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);
```

T3



SUB variant

Applies when `S == 0`.

```
SUB<c>.W {<Rd>,} <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or
T2
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

SUBS variant

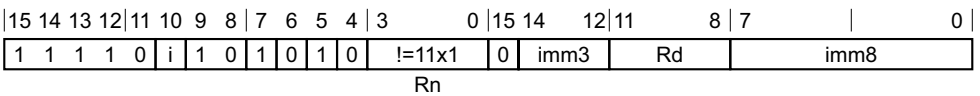
Applies when `S == 1 && Rd != 1111`.

```
SUBS.W {<Rd>,} <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
SUBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (immediate);
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T4



T4 variant

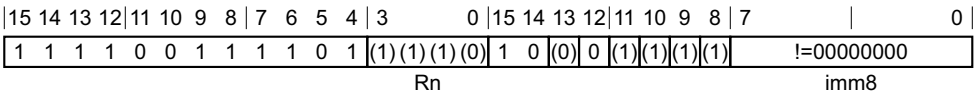
```
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
SUBW{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for this encoding

```
if Rn == '1111' then SEE ADR;
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T5



T5 variant

```
SUBS{<c>}{<q>} PC, LR, #<imm8>
```

Decode for this encoding

```
if Rn == '1110' && IsZero(imm8) then SEE ERET;
d = 15;  n = UInt(Rn);  setflags = TRUE;  imm32 = ZeroExtend(imm8, 32);
if n != 14 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *SUBS PC. LR and related instructions (A32)* on page K1-5350 and *SUBS PC, LR and related instructions (T32)* on page K1-5350.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rdn>` Is the general-purpose source and destination register, encoded in the "Rdn" field.

`<imm8>` For encoding T2: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

For encoding T5: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. If `<Rn>` is the LR, and zero is used, see ERET.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction unless `<Rn>` is the LR.

For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate). If the PC is used, see ADR.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate).

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<imm3>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

In the T32 instruction set, `MOVS{<c>}{<q>} PC, LR` is a pseudo-instruction for `SUBS{<c>}{<q>} PC, LR, #0`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), '1');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.239 SUB, SUBS (register)

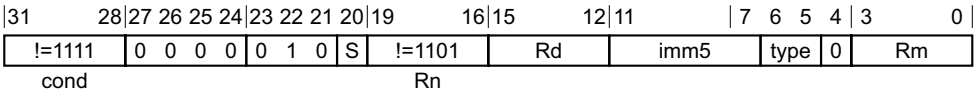
Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



SUB, rotate right with extend variant

Applies when S == 0 && imm5 == 00000 && type == 11.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUB, shift or rotate by value variant

Applies when S == 0 && !(imm5 == 00000 && type == 11).

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend variant

Applies when S == 1 && imm5 == 00000 && type == 11.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUBS, shift or rotate by value variant

Applies when S == 1 && !(imm5 == 00000 && type == 11).

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rn == '1101' then SEE SUB (SP minus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

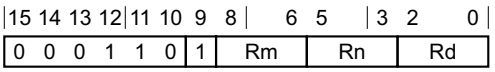
Non-Confidential - Beta

T1



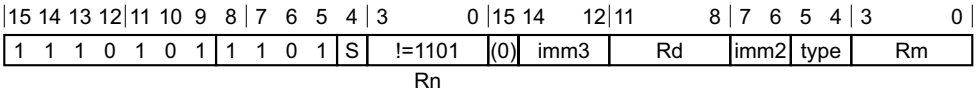
T1 variant

```
SUB<c>{<q>} <Rd>, <Rn>, <Rm> // Inside IT block
SUBS{<q>} {<Rd>,} <Rn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



SUB, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUB, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
SUB<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUBS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
SUBS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (register);
if Rn == '1101' then SEE SUB (SP minus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see SUB, SUBS (SP minus register).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus register).

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

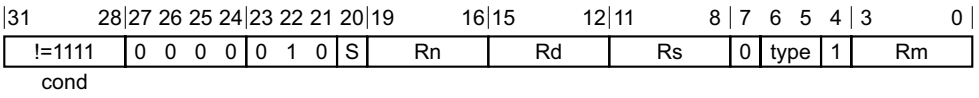
F5.1.240 SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting variant

Applies when `S == 1`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

F5.1.241 SUB, SUBS (SP minus immediate)

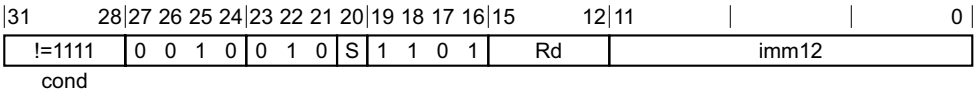
Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



SUB variant

Applies when `S == 0`.

```
SUB{<c>}{<q>} {<Rd>,} SP, #<const>
```

SUBS variant

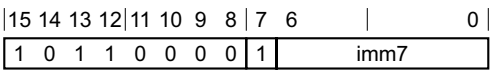
Applies when `S == 1`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1



T1 variant

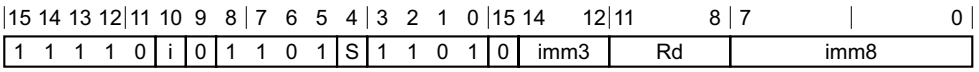
```
SUB{<c>}{<q>} {SP,} SP, #<imm7>
```

Decode for this encoding

```
d = 13;  setflags = FALSE;  imm32 = ZeroExtend(imm7:'00', 32);
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

T2



SUB variant

Applies when `S == 0`.

```
SUB{<c>}.W {<Rd>,} SP, #<const> // <Rd>, <const> can be represented in T1
SUB{<c>}{<q>} {<Rd>,} SP, #<const>
```

SUBS variant

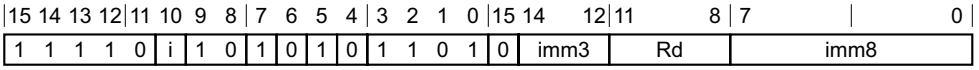
Applies when `S == 1 && Rd != 1111`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (immediate);
d = UInt(Rd);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

T3



T3 variant

```
SUB{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
SUBW{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Decode for this encoding

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<imm7> Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction unless <Rn> is the LR.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.242 SUB, SUBS (SP minus register)

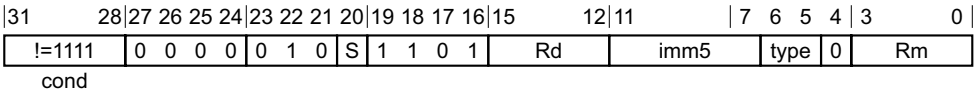
Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3693.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1



SUB, rotate right with extend variant

Applies when S == 0 && imm5 == 00000 && type == 11.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

SUB, shift or rotate by value variant

Applies when S == 0 && !(imm5 == 00000 && type == 11).

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend variant

Applies when S == 1 && imm5 == 00000 && type == 11.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

SUBS, shift or rotate by value variant

Applies when S == 1 && !(imm5 == 00000 && type == 11).

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

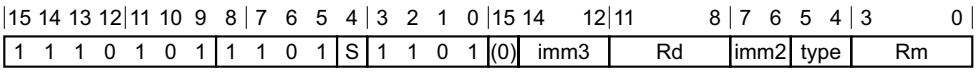
Non-Confidential - Beta

T1



SUB, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && type == 11`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

SUB, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
SUB{<c>}.W {<Rd>,} SP, <Rm> // <Rd>, <Rm> can be represented in T1 or T2
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

SUBS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (register);
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2211.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

Non-Confidential - Beta

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

`ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(SP, NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.243 SVC

Supervisor Call causes a Supervisor Call exception. For more information, see *Supervisor Call (SVC) exception* on page G1-3711.

Note

SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.

In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If HCR.TGE is set to 1, and the SVC is executed in Non-secure User mode. For more information, see *Supervisor Call exception, when the value of HCR.TGE is 1* on page G1-3687

In these cases, the HSR identifies that the exception entry was caused by a Supervisor Call exception, EC value 0x11, see *Use of the HSR* on page G4-3989. The immediate field in the HSR:

- If the SVC is unconditional:
  - For the T32 instruction, is the zero-extended value of the imm8 field.
  - For the A32 instruction, is the least-significant 16 bits the imm24 field.
- If the SVC is conditional, is UNKNOWN.

A1

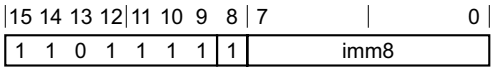
A1 variant

```
SVC{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm24, 32);
// imm32 is for assembly/disassembly. SVC handlers in some
// systems interpret imm24 in software, for example to determine the required service.
```

T1



T1 variant

```
SVC{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm8, 32);
// imm32 is for assembly/disassembly. SVC handlers in some
// systems interpret imm8 in software, for example to determine the required service.
```

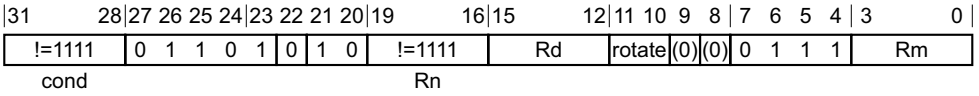
F5.1.244 SXTAB

Signed Extend and Add Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1



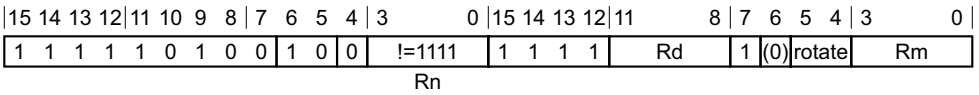
A1 variant

```
SXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE SXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE SXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

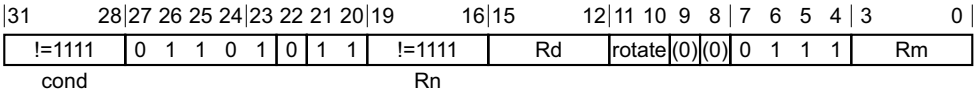
F5.1.246 SXTAH

Signed Extend and Add Halfword extracts a 16-bit value from a register, sign-extends it to 32 bits, adds the result to a value from another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

A1



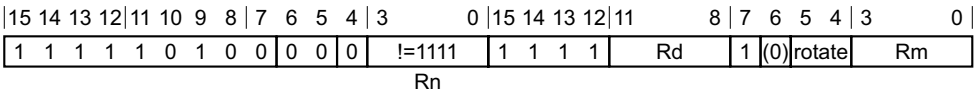
A1 variant

```
SXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE SXTH;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE SXTH;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<amount>` Is the rotate amount, encoded in the "rotate" field. It can have the following values:

`(omitted)` when `rotate = 00`

`8` when `rotate = 01`

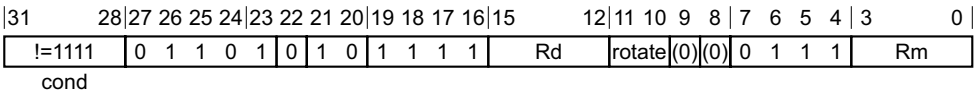
F5.1.247 SXTB

Signed Extend Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1



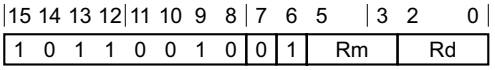
A1 variant

```
SXTB{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



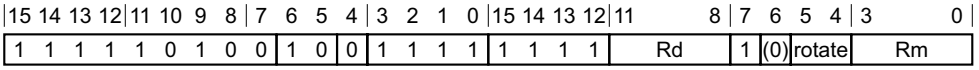
T1 variant

```
SXTB{<c>}{<q>} {<Rd>,} <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = 0;
```

T2



T2 variant

```
SXTB{<c>}.W {<Rd>,} <Rm> // <Rd>, <Rm> can be represented in T1
SXTB{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

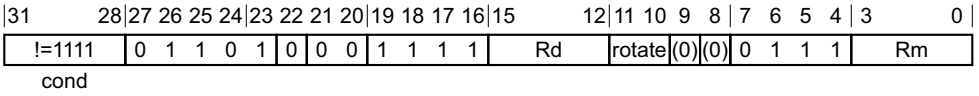
F5.1.248 SXTB16

Signed Extend Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, and writes the results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

A1



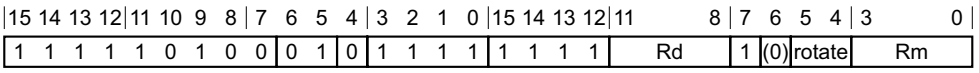
A1 variant

```
SXTB16{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SXTB16{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

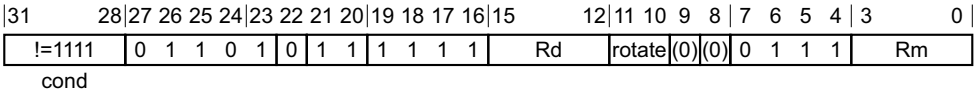
F5.1.249 SXTH

Signed Extend Halfword extracts a 16-bit value from a register, sign-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

A1



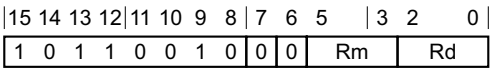
A1 variant

```
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



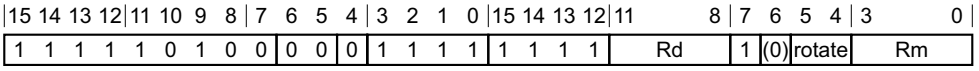
T1 variant

```
SXTH{<c>}{<q>} {<Rd>,} <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = 0;
```

T2



T2 variant

```
SXTH{<c>}.W {<Rd>,} <Rm> // <Rd>, <Rm> can be represented in T1
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

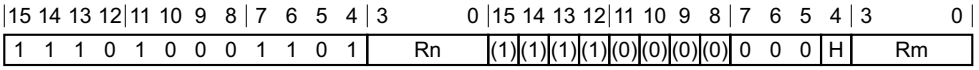
F5.1.250 TBB, TBH

Table Branch Byte or Halfword causes a PC-relative forward branch using a table of single byte or halfword offsets. A base register provides a pointer to the table, and a second register supplies an index into the table. The branch length is twice the value returned from the table.

T1



Byte variant

Applies when `H == 0`.

```
TBB{<c>}{<q>} [<Rn>, <Rm>] // Outside or last in IT block
```

Halfword variant

Applies when `H == 1`.

```
TBH{<c>}{<q>} [<Rn>, <Rm>, LSL #1] // Outside or last in IT block
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);  is_tbh = (H == '1');
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.

`<Rm>` For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.

For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if is_tbh then
        halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);
    else
        halfwords = UInt(MemU[R[n]+R[m], 1]);
    BranchWritePC(PC + 2*halfwords);
```

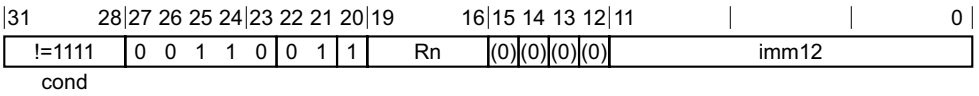
Non-Confidential - Beta

F5.1.251 TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1



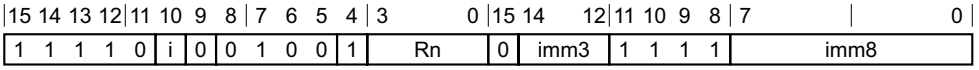
A1 variant

```
TEQ{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



T1 variant

```
TEQ{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values. For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

Non-Confidential - Beta

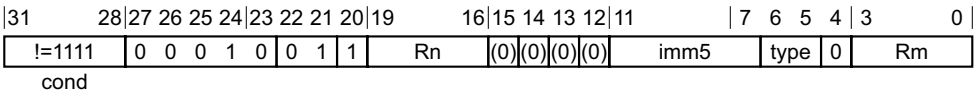
F5.1.252 TEQ (register)

Test Equivalence (register) performs a bitwise exclusive OR operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



Rotate right with extend variant

Applies when `imm5 == 00000 && type == 11`.

```
TEQ{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

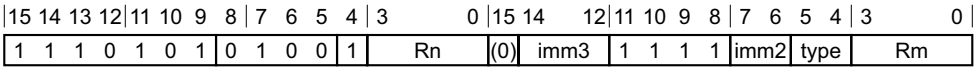
Applies when `!(imm5 == 00000 && type == 11)`.

```
TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1



Rotate right with extend variant

Applies when `imm3 == 000 && imm2 == 00 && type == 11`.

```
TEQ{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

```
TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

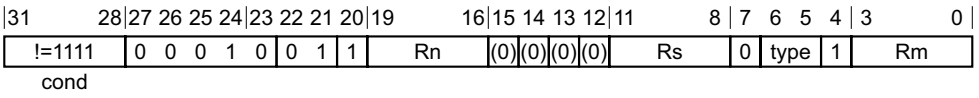
Non-Confidential - Beta

F5.1.253 TEQ (register-shifted register)

Test Equivalence (register-shifted register) performs a bitwise exclusive OR operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



A1 variant

```
TEQ{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

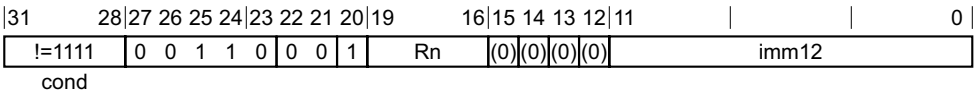
Non-Confidential - Beta

F5.1.254 TST (immediate)

Test (immediate) performs a bitwise AND operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1



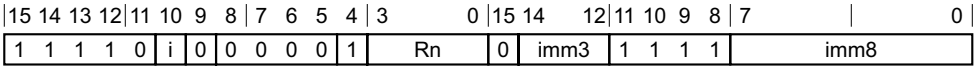
A1 variant

```
TST{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1



T1 variant

```
TST{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2337 for the range of values. For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2336 for the range of values.

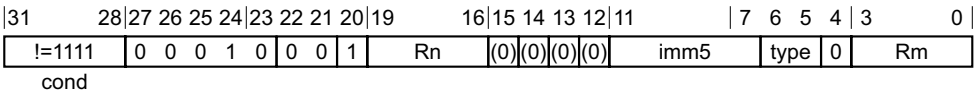
F5.1.255 TST (register)

Test (register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



Rotate right with extend variant

Applies when `imm5 == 00000 && type == 11`.

```
TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

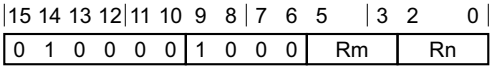
Applies when `!(imm5 == 00000 && type == 11)`.

```
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

T1



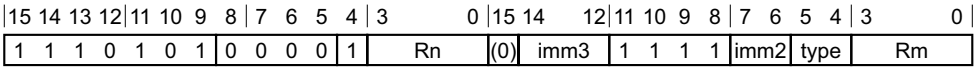
T1 variant

```
TST{<c>}{<q>} <Rn>, <Rm>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



Rotate right with extend variant

Applies when `imm3 == 000 && imm2 == 00 && type == 11`.

```
TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
TST{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL`	when `type = 00`
`LSR`	when `type = 01`
`ASR`	when `type = 10`
`ROR`	when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

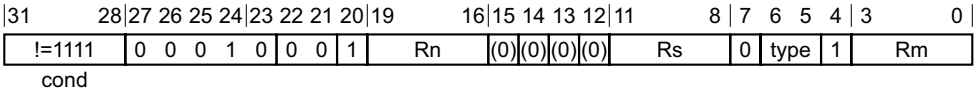
```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F5.1.256 TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



A1 variant

```
TST{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

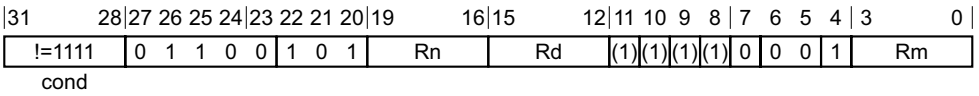
Non-Confidential - Beta

F5.1.257 UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

A1



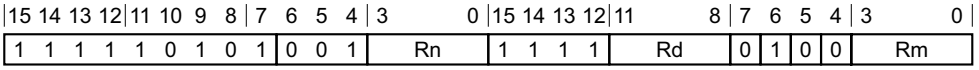
A1 variant

```
UADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.

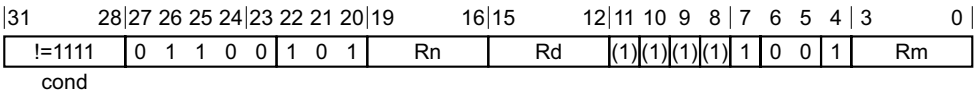
F5.1.258 UADD8

Unsigned Add 8 performs four unsigned 8-bit integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

A1



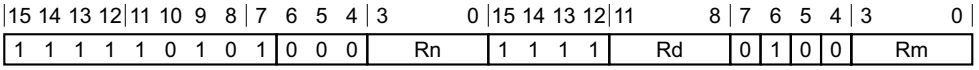
A1 variant

```
UADD8{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UADD8{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m  == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

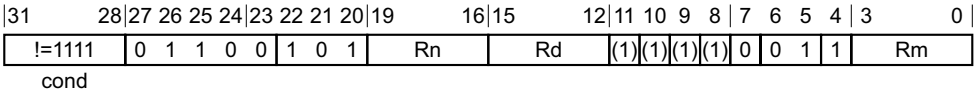
F5.1.259 UASX

Unsigned Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer addition and one unsigned 16-bit subtraction, and writes the results to the destination register. It sets PSTATE.GE according to the results.

A1



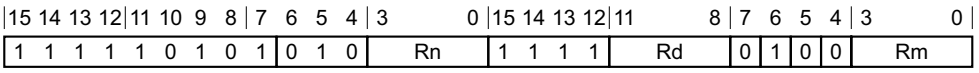
A1 variant

```
UASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    diff = UInt(R[n]<15:0>) - UInt(R[m]<31:16>);
    sum  = UInt(R[n]<31:16>) + UInt(R[m]<15:0>);
```

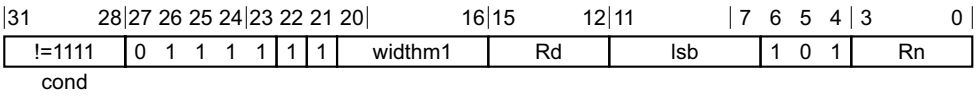
F5.1.260 UBFX

Unsigned Bit Field Extract extracts any number of adjacent bits at any position from a register, zero-extends them to 32 bits, and writes the result to the destination register.

A1



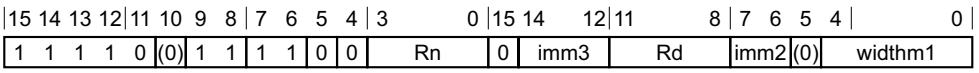
A1 variant

```
UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(lsb);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(imm3:imm2);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *UBFX* on page K1-5342.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<lsb>	For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field. For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.

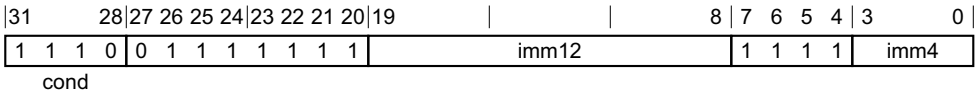
F5.1.261 UDF

Permanently Undefined generates an Undefined Instruction exception.

The encodings for UDF used in this section are defined as permanently UNDEFINED in the ARMv8-A architecture. However:

- With the T32 instruction set, ARM deprecates using the UDF instruction in an IT block.
- In the A32 instruction set, UDF is not conditional.

A1



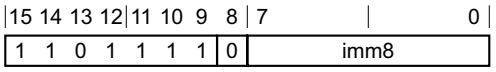
A1 variant

```
UDF{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm12:imm4, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

T1



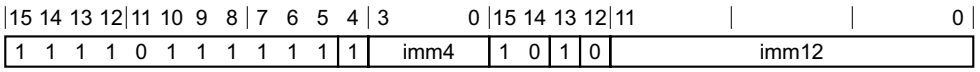
T1 variant

```
UDF{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm8, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

T2



T2 variant

```
UDF{<c>}.W {#}<imm> // <imm> can be represented in T1
UDF{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm4:imm12, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

Non-Confidential - Beta

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2322. <c> must be AL or omitted.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2322. ARM deprecates using any <c> value other than AL.

<q> See *Standard assembler syntax fields* on page F2-2322.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE ignores the value of this constant.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE ignores the value of this constant.

For encoding T2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. The PE ignores the value of this constant.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    UNDEFINED;
```

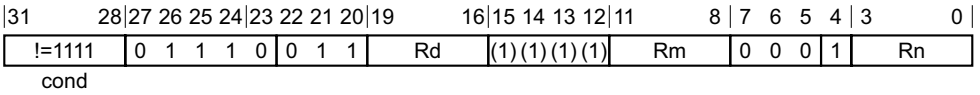
Non-Confidential - Beta

F5.1.262 UDIV

Unsigned Divide divides a 32-bit unsigned integer register value by a 32-bit unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

See *Divide instructions* on page F1-2295 for more information about this instruction.

A1



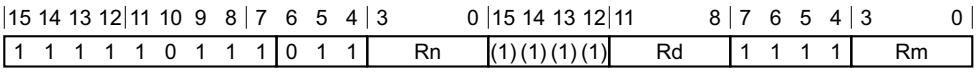
A1 variant

```
UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *UDIV* on page K1-5343.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if UInt(R[m]) == 0 then
```

Non-Confidential - Beta

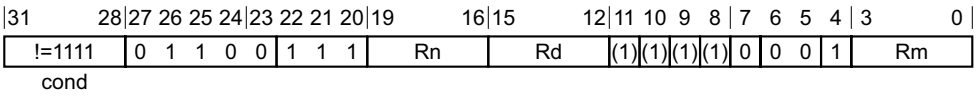
F5.1.263 UHADD16

Unsigned Halving Add 16 performs two unsigned 16-bit integer additions, halves the results, and writes the results to the destination register.

A1



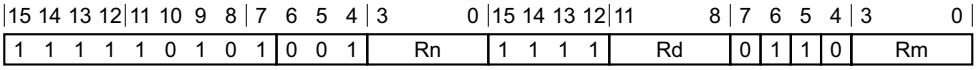
A1 variant

```
UHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

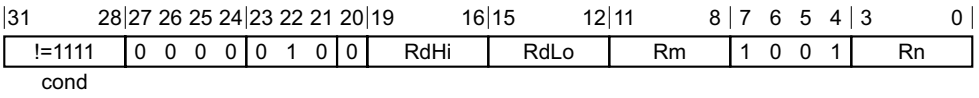
F5.1.269 UMAAL

Unsigned Multiply Accumulate Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, adds two unsigned 32-bit values, and writes the 64-bit result to two registers.

A1



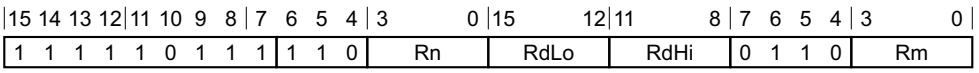
A1 variant

```
UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

T1



T1 variant

```
UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *UMAAL* on page K1-5343.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<RdLo>	Is the general-purpose source register holding the first addend and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose source register holding the second addend and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

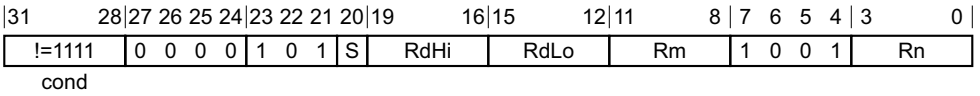
F5.1.270 UMLAL, UMLALS

Unsigned Multiply Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1



Flag setting variant

Applies when `S == 1`.

```
UMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Not flag setting variant

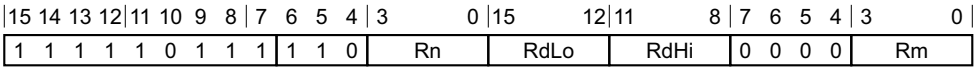
Applies when `S == 0`.

```
UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

T1



T1 variant

```
UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *UMLAL* on page K1-5343.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

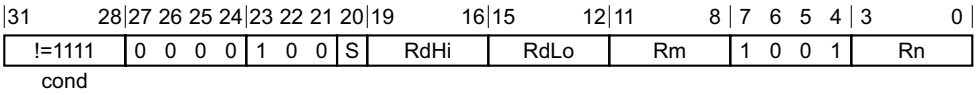
F5.1.271 UMULL, UMULLS

Unsigned Multiply Long multiplies two 32-bit unsigned values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1



Flag setting variant

Applies when `S == 1`.

```
UMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Not flag setting variant

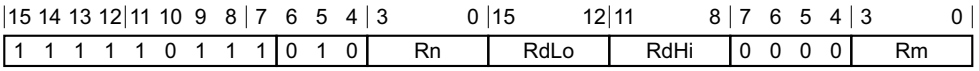
Applies when `S == 0`.

```
UMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

T1



T1 variant

```
UMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *UMULL* on page K1-5344.

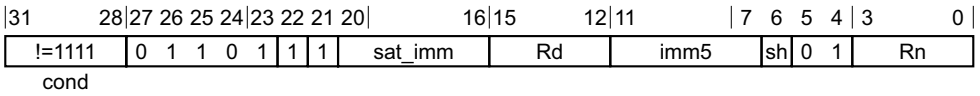
F5.1.280 USAT

Unsigned Saturate saturates an optionally-shifted signed value to a selected unsigned range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

A1



Arithmetic shift right variant

Applies when `sh == 1`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

Logical shift left variant

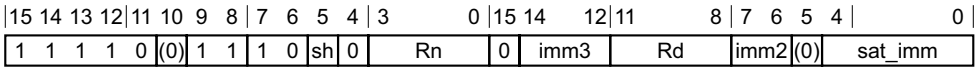
Applies when `sh == 0`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1



Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

Logical shift left variant

Applies when `sh == 0`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '00000' then SEE USAT16;
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the bit position for saturation, in the range 0 to 31, encoded in the "sat_imm" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<amount>	For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field. For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C);  // PSTATE.C ignored
    (result, sat) = UnsignedSatQ(SInt(operand), saturate_to);
    R[d] = ZeroExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

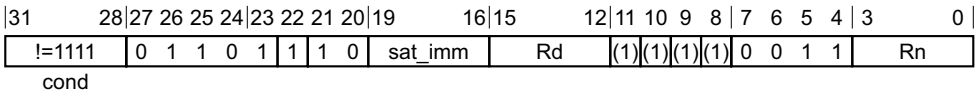
Non-Confidential - Beta

F5.1.281 USAT16

Unsigned Saturate 16 saturates two signed 16-bit values to a selected unsigned range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

A1



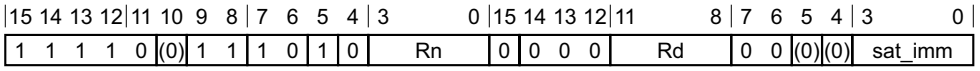
A1 variant

```
USAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
USAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

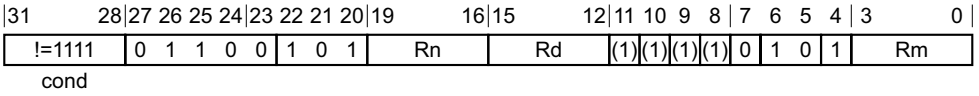
F5.1.282 USAX

Unsigned Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer subtraction and one unsigned 16-bit addition, and writes the results to the destination register. It sets PSTATE.GE according to the results.

A1



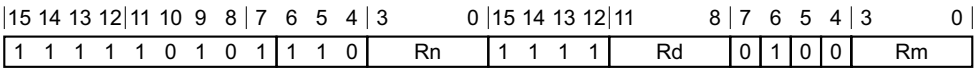
A1 variant

```
USAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
USAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

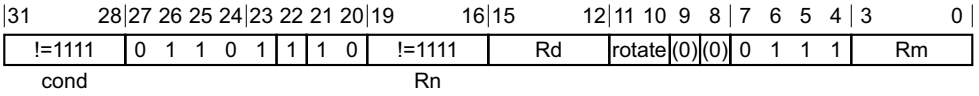
F5.1.285 UXTAB

Unsigned Extend and Add Byte extracts an 8-bit value from a register, zero-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1



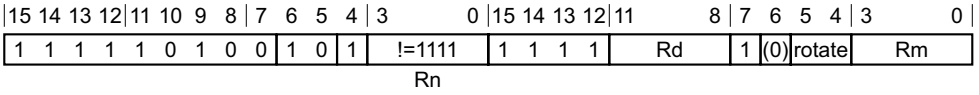
A1 variant

```
UXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE UXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
UXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE UXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

F5.1.291 WFE

Wait For Event is a hint instruction that permits the PE to enter a low-power state until one of a number of events occurs, including events signaled by executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-3730.

As described in *Wait For Event and Send Event* on page G1-3730, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-3745.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-3761.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-3772.

F5.1.293 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see *The Yield instruction* on page F1-2301.

F5.2 Encoding and use of Banked register transfer instructions

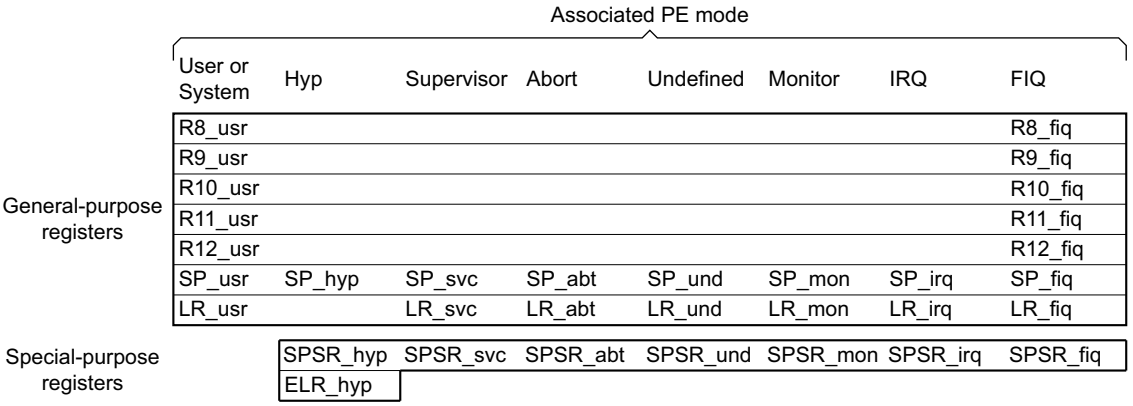
Software executing at EL1 or higher can use the MRS (Banked register) and MSR (Banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- *Register arguments in the Banked register transfer instructions*.
- *Usage restrictions on the Banked register transfer instructions* on page F5-3103.
- *Encoding the register argument in the Banked register transfer instructions* on page F5-3104.
- *Pseudocode support for the Banked register transfer instructions* on page F5-3105.

For descriptions of the instructions see *MRS (Banked register)* on page F5-2733 and *MSR (Banked register)* on page F5-2736.

F5.2.1 Register arguments in the Banked register transfer instructions

Figure F5-1 shows the Banked general-purpose registers and Special-purpose registers:



For the general-purpose registers, if no other register is shown, the *current mode register* is the _usr register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is {R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_hyp}.
- For Abort mode, is {R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt}.

Figure F5-1 Banking of general-purpose and Special-purpose registers

Figure F5-1 is based on Figure G1-2 on page G1-3657, that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

Note

- System mode uses the same set of registers as User mode. Neither of these modes can access an SPSR, except that System mode can use the MRS (Banked register) and MSR (Banked register) instructions to access some SPSRs, as described in *Usage restrictions on the Banked register transfer instructions* on page F5-3103.
- General-purpose registers R0-R7, that are not Banked, cannot be accessed using the MRS (Banked register) and MSR (Banked register) instructions.
- In addition to the registers shown in Figure F5-1, the DLR and DSPSR are AArch32 System registers that map onto the AArch64 Special-purpose registers DLR_EL0 and DSPSR_EL0. However, DLR and DSPSR are not accessible using the MRS (Banked register) and MSR (Banked register) instructions.

Software using an MRS (Banked register) or MSR (Banked register) instruction specifies one of these registers using a name shown in Figure F5-1, or an alternative name for SP or LR. These registers can be grouped as follows:

R8-R12 Each of these registers has two Banked copies, _usr and _fiq, for example R8_usr and R8_fiq.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

SP There is a Banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.

LR There is a Banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.

SPSR There is a Banked copy of SPSR for every mode except System mode and User mode.

ELR_hyp Except for the operations provided by MRS (Banked register) and MSR (Banked register), ELR_hyp is accessible only from Hyp mode. It is not Banked.

F5.2.2 Usage restrictions on the Banked register transfer instructions

MRS (Banked register) and MSR (Banked register) instructions are CONSTRAINED UNPREDICTABLE if any of the following applies:

- The instruction is executed in User mode.
- The instruction accesses a Banked register that is not implemented, or that either:
  - Is not accessible from the current Privilege level and Security state.
  - Can be accessed from the current mode by using a different instruction.

MSR/MRS Banked registers on page K1-5366 describes the permitted CONSTRAINED UNPREDICTABLE behavior.

An MRS (Banked register) or an MSR (Banked register) executed:

- At Non-secure EL1 cannot access any Hyp mode Banked registers.
- At Non-secure EL1 or EL2 cannot access any Monitor mode Banked registers.
- In a Secure mode other than Monitor mode cannot access any Hyp Banked registers.

This means that the Banked registers that MRS (Banked register) and MSR (Banked register) instructions cannot access are:

From Monitor mode

- The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

From Hyp mode

- The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

Note

MRS (Banked register) and MSR (Banked register) instructions can access the current mode register ELR_hyp.

From FIQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

From System mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

From Supervisor mode, Abort mode, Undefined mode, and IRQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If EL3 is using AArch64, all MRS (Banked register) and MSR (Banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-1519.

For more information, see:

- *Encoding the register argument in the Banked register transfer instructions*.
- *Pseudocode support for the Banked register transfer instructions* on page F5-3105.
- *MRS (Banked register)* on page F5-2733.
- *MSR (Banked register)* on page F5-2736.

Note

CONSTRAINED UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

F5.2.3 Encoding the register argument in the Banked register transfer instructions

The MRS (Banked register) and MSR (Banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a Banked copy of the SPSR, and Table F5-1 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

Table F5-1 Banked register encodings when R==0

	SYSm<4:3>			
SYSm<2:0>	0b00	0b01	0b10	0b11
0b000	R8_usr	R8_fiq	LR_irq	CONST. UNPREDICTABLE
0b001	R9_usr	R9_fiq	SP_irq	CONST. UNPREDICTABLE
0b010	R10_usr	R10_fiq	LR_svc	CONST. UNPREDICTABLE
0b011	R11_usr	R11_fiq	SP_svc	CONST. UNPREDICTABLE
0b100	R12_usr	R12_fiq	LR_abt	LR_mon
0b101	SP_usr	SP_fiq	SP_abt	SP_mon
0b110	LR_usr	LR_fiq	LR_und	ELR_hyp
0b111	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SP_und	SP_hyp

When the R bit is set to 1, the argument is a Banked copy of the SPSR, and Table F5-2 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

Table F5-2 Banked register encodings when R==1

	SYSm<4:3>			
SYSm<2:0>	0b00	0b01	0b10	0b11
0b000	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SPSR_irq	CONST. UNPREDICTABLE
0b001	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE
0b010	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SPSR_svc	CONST. UNPREDICTABLE

Non-Confidential - Beta

Table F5-2 Banked register encodings when R==1 (continued)

	SYSm<4:3>			
SYSm<2:0>	0b00	0b01	0b10	0b11
0b011	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE
0b100	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SPSR_abt	SPSR_mon
0b101	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE
0b110	CONST. UNPREDICTABLE	SPSR_fiq	SPSR_und	SPSR_hyp
0b111	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE

F5.2.4 Pseudocode support for the Banked register transfer instructions

The pseudocode functions `BankedRegisterAccessValid()` and `SPSRaccessValid()` check the validity of `MRS` (Banked register) and `MSR` (Banked register) accesses. That is, they filter the accesses that are CONSTRAINED UNPREDICTABLE either because:

- They attempt to access a register that *Usage restrictions on the Banked register transfer instructions* on page F5-3103 shows is not accessible.
- They use an `SYSm<4:0>` encoding that *Encoding the register argument in the Banked register transfer instructions* on page F5-3104 shows as CONSTRAINED UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to ELR_hyp, and `SPSRaccessValid()` applies to accesses to the SPSRs.

Chapter F6
T32 and A32 Advanced SIMD and floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of floating-point and Advanced SIMD instructions* on page F6-3108.

Note

Some headings in this chapter use the term *floating-point register*. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F6.1 Alphabetical list of floating-point and Advanced SIMD instructions

This section lists every floating-point and Advanced SIMD instruction in the T32 and A32 instruction sets. For details of the format used see *Format of instruction descriptions* on page F2-2318.

This section is formatted so that each instruction description starts on a new page.

F6.1.5 FLDMDBX, FLDMIAX

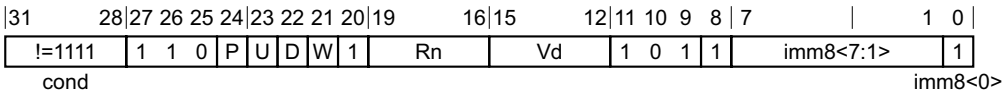
FLDMDBX is the Decrement Before variant of this instruction, and FLDMIAX is the Increment After variant.

FLDM*X loads multiple SIMD&FP registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

ARM deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

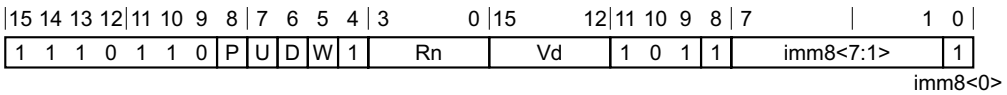
Applies when `P == 0 && U == 1`.

```
FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FLDMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

T1



Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

```
FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VLDR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FLDMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLDM* on page K1-5355.

Related encodings: See *Advanced SIMD and floating-point 64-bit move* on page F3-2363 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-2446 for the A32 instruction set.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
!	Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
<dreglist>	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4];  address = address+4;
        else
            word1 = MemA[address,4];  word2 = MemA[address+4,4];  address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.6 FSTMDBX, FSTMIAX

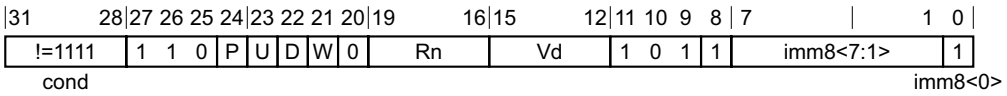
FSTMDBX is the Decrement Before variant of this instruction, and FSTMIAX is the Increment After variant.

FSTM*X stores multiple SIMD&FP registers from the Advanced SIMD and floating-point register file to consecutive locations in using an address from a general-purpose register.

ARM deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

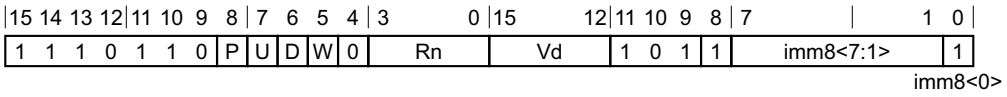
Applies when `P == 0 && U == 1`.

```
FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE VSTR;
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FSTMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

T1



Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

```
FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

F6.1.17 VABA

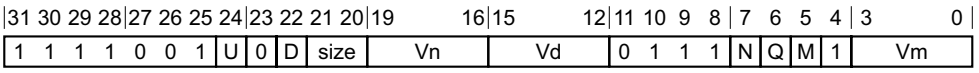
Vector Absolute Difference and Accumulate subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand and result elements are all integers of the same length.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant

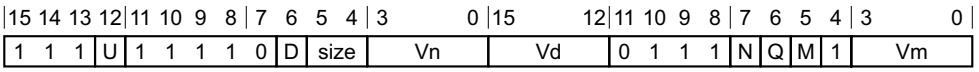
Applies when `Q == 1`.

```
VABA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = (U == '1');  long_destination = FALSE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VABA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = (U == '1');  long_destination = FALSE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VABA or VABAL instruction must be unconditional. ARM strongly recommends that a T32 VABA or VABAL instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

S8 when U = 0, size = 00

S16 when U = 0, size = 01

S32 when U = 0, size = 10

U8 when U = 1, size = 00

U16 when U = 1, size = 01

U32 when U = 1, size = 10

The following encodings are reserved:

- U = 0, size = 11.
- U = 1, size = 11.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];
            op2 = Elem[Din[m+r],e,esize];
            absdiff = Abs(Int(op1,unsigned) - Int(op2,unsigned));
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + absdiff;
            else
                Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + absdiff;
```

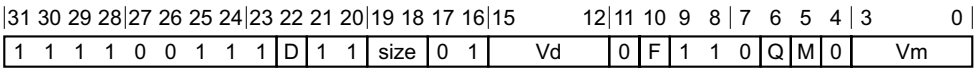
F6.1.22 VABS

Vector Absolute takes the absolute value of each element in a vector, and places the results in a second vector. The floating-point version only clears the sign bit.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

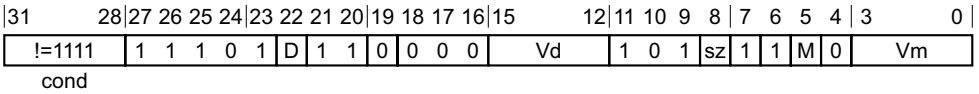
Applies when `Q == 1`.

```
VABS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (F == '1' && size != '10') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
advsimd = TRUE;  floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2



Single-precision scalar variant

Applies when `sz == 0`.

```
VABS{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VABS{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE;  dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

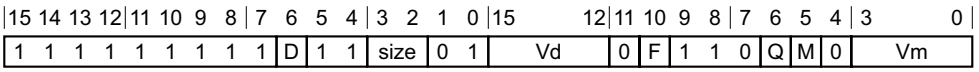
Non-Confidential - Beta

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

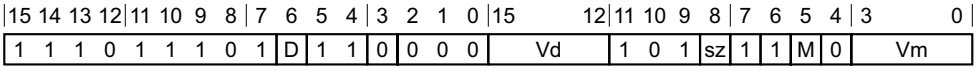
Applies when `Q == 1`.

```
VABS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (F == '1' && size != '10') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
advsimd = TRUE;  floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T2



Single-precision scalar variant

Applies when `sz == 0`.

```
VABS{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VABS{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE;  dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD `VABS` instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD `VABS` instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the vectors, encoded in the "F:size" field. It can have the following values:

S8 when F = 0, size = 00

S16 when F = 0, size = 01

S32 when F = 0, size = 10

F32 when F = 1, size = 10

The following encodings are reserved:

- F = 0, size = 11.
- F = 1, size = 0x.
- F = 1, size = 11.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                if floating_point then
                    Elem[D[d+r],e,esize] = FPAbs(Elem[D[m+r],e,esize]);
                else
                    result = Abs(SInt(Elem[D[m+r],e,esize]));
                    Elem[D[d+r],e,esize] = result<esize-1:0>;
    else             // VFP instruction
        if dp_operation then
            D[d] = FPAbs(D[m]);
        else
            S[d] = FPAbs(S[m]);
```

F6.1.23 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements must be 32-bit floating-point numbers.

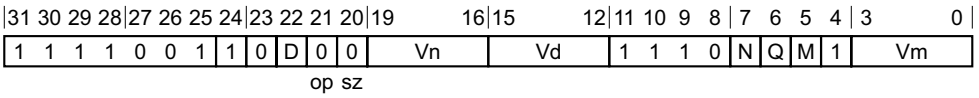
The result vector elements are 32-bit fields.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2323.

This instruction is used by the alias VACLE. See the *Alias conditions* on page F6-3151 table for details of when each alias is preferred.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VACGE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

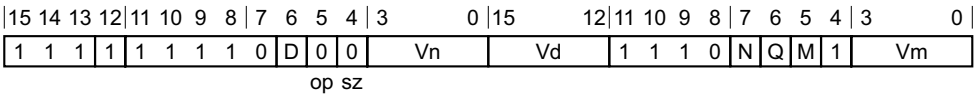
Applies when `Q == 1`.

```
VACGE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
or_equal = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VACGE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
VACGE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
or_equal = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Alias conditions

Alias	is preferred when
VACLE	Never

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VACGE, VACGT, VACLE, or VACLT instruction must be unconditional. ARM strongly recommends that a T32 VACGE, VACGT, VACLE, or VACLT instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1

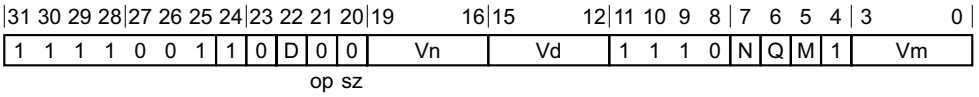
F6.1.24 VACLE

Vector Absolute Compare Less Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is an alias of the VACGE instruction. This means that:

- The encodings in this description are named to match the encodings of VACGE.
- The description of VACGE gives the operational pseudocode for this instruction.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VACLE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VACGE{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

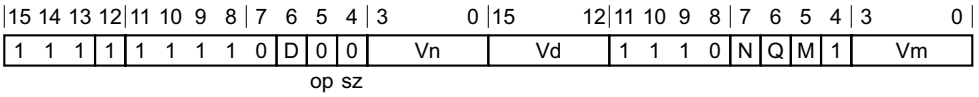
```
VACLE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

is equivalent to

```
VACGE{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>
```

and is never the preferred disassembly.

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VACLE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VACGE{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

For encoding T2: see *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPAdd(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize],
                                             StandardFPSCRValue());
    else             // VFP instruction
        if dp_operation then
            D[d] = FPAdd(D[n], D[m], FPSCR);
        else
            S[d] = FPAdd(S[n], S[m], FPSCR);
```

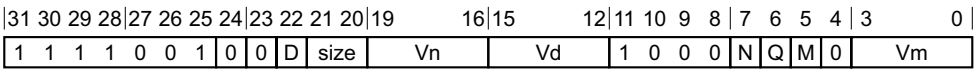
F6.1.28 VADD (integer)

Vector Add (integer) adds corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

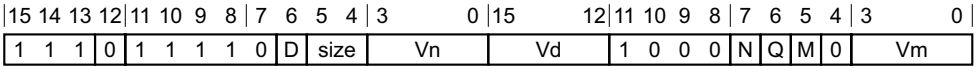
Applies when `Q == 1`.

```
VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD VADD instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VADD instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

I8	when size = 00
I16	when size = 01
I32	when size = 10
I64	when size = 11

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] + Elem[D[m+r],e,esize];
```

F6.1.29 VADDHN

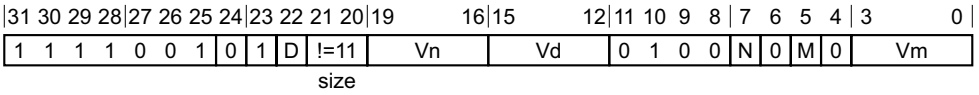
Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see VRADDHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



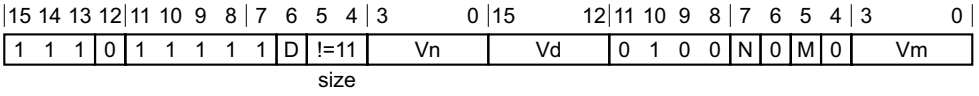
A1 variant

```
VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1



T1 variant

```
VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-2369 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-2457 for the A32 instruction set.

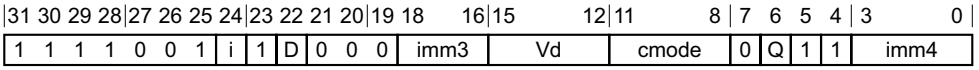
F6.1.32 VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector

This instruction is an alias of the VBIC (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VBIC (immediate).
- The description of VBIC (immediate) gives the operational pseudocode for this instruction.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

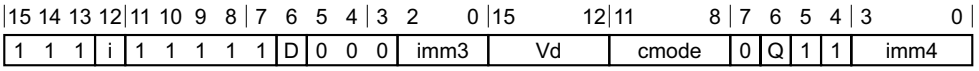
```
VAND{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Qd>, #~<imm>
```

and is never the preferred disassembly.

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VAND{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Qd>, #~<imm>
```

and is never the preferred disassembly.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322. An A32 `VORR` instruction must be unconditional. ARM strongly recommends that a T32 `VORR` instruction is unconditional, see *Conditional execution* on page F2-2323.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<dt>`	The data type used for `<imm>`. It can be either `I16` or `I32`. `I8`, `I64`, and `F32` are also permitted, but the resulting syntax is a pseudo-instruction.
`<Qd>`	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
`<Dd>`	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
`<imm>`	Is a constant of the type specified by `<dt>` that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<dt>` and `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2338.

Operation for all encodings

The description of VBIC (immediate) gives the operational pseudocode for this instruction.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

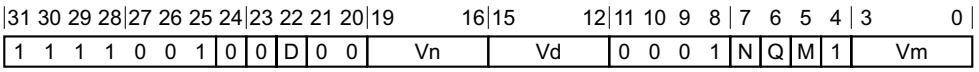
F6.1.33 VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

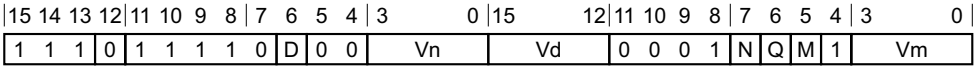
Applies when `Q == 1`.

```
VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Non-Confidential - Beta

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322. An A32 VAND instruction must be unconditional. ARM strongly recommends that a T32 VAND instruction is unconditional, see *Conditional execution* on page F2-2323.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```

Non-Confidential - Beta

F6.1.34 VBIC (immediate)

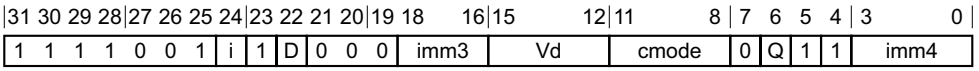
Vector Bitwise Bit Clear (immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

This instruction is used by the alias VAND (immediate). See the *Alias conditions* on page F6-3174 table for details of when each alias is preferred.

A1



64-bit SIMD vector variant

Applies when `cmode<3:2> != 11`, `cmode<0> == 1`, and `Q == 0`.

```
VBIC{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

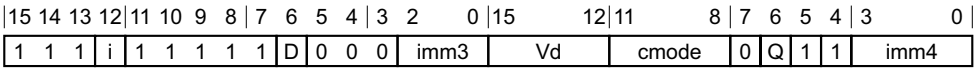
Applies when `cmode<3:2> != 11`, `cmode<0> == 1`, and `Q == 1`.

```
VBIC{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `cmode<3:2> != 11`, `cmode<0> == 1`, and `Q == 0`.

```
VBIC{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `cmode<3:2> != 11`, `cmode<0> == 1`, and `Q == 1`.

```
VBIC{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2375 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2463 for the A32 instruction set.

Alias conditions

Alias	is preferred when
VAND (immediate)	Never

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VBIC instruction must be unconditional. ARM strongly recommends that a T32 VBIC instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2338.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] AND NOT(imm64);
```

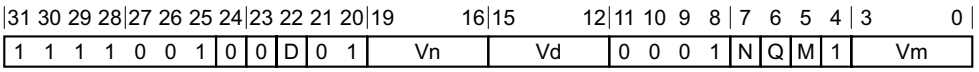
F6.1.35 VBIC (register)

Vector Bitwise Bit Clear (register) performs a bitwise AND between a register value and the complement of a register value, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

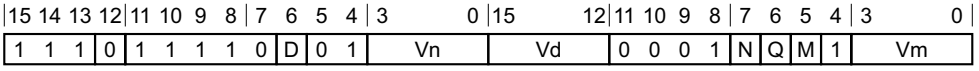
Applies when `Q == 1`.

```
VBIC{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VBIC{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

F6.1.39 VCEQ (immediate #0)

Vector Compare Equal to Zero takes each element in a vector, and compares it with zero. If it is equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

F6.1.41 VCGE (immediate #0)

Vector Compare Greater Than or Equal to Zero takes each element in a vector, and compares it with zero. If it is greater than or equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

F6.1.45 VCLE (immediate #0)

Vector Compare Less Than or Equal to Zero takes each element in a vector, and compares it with zero. If it is less than or equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1

F6.1.47 VCLS

Vector Count Leading Sign Bits counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector. The count does not include the topmost bit itself.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit signed integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

F6.1.50 VCLZ

Vector Count Leading Zeros counts the number of consecutive zeros, starting from the most significant bit, in each element in a vector, and places the results in a second vector.

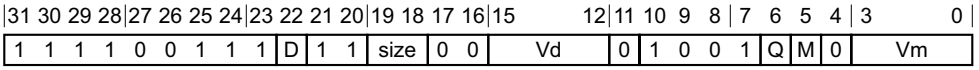
The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLZ{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```

d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VCLZ instruction must be unconditional. ARM strongly recommends that a T32 VCLZ instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

- I8 when size = 00
- I16 when size = 01
- I32 when size = 10

The encoding size = 11 is reserved.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = CountLeadingZeroBits(Elem[D[m+r],e,esize])<esize-1:0>;
```

F6.1.51 VCMP

Vector Compare compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.{N, Z, C, V} Condition flags by a subsequent VMRS instruction.

It raises an Invalid Operation exception only if either operand is a signaling NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This results in the FPSCR flags being set as N=0, Z=0, C=1 and V=1.

VCMPE raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    if dp_operation then
        bits(64) op64 = if with_zero then FPZero('0') else D[m];
        FPSCR.<N,Z,C,V> = FPCompare(D[d], op64, quiet_nan_exc, FPSCR);
    else
        bits(32) op32 = if with_zero then FPZero('0') else S[m];
        FPSCR.<N,Z,C,V> = FPCompare(S[d], op32, quiet_nan_exc, FPSCR);
```

F6.1.56 VCVT (between floating-point and integer, Advanced SIMD)

Vector Convert between floating-point and integer converts each element in a vector from floating-point to integer, or from integer to floating-point, and places the results in a second vector.

The vector elements must be 32-bit floating-point numbers, or 32-bit integers. Signed and unsigned integers are distinct.

The floating-point to integer operation uses the Round towards Zero rounding mode. The integer to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

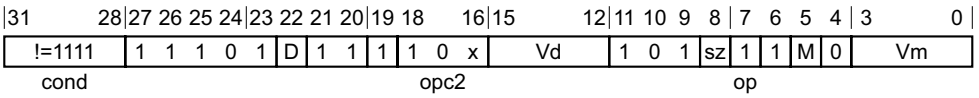
F6.1.57 VCVT (floating-point to integer, floating-point)

Convert floating-point to integer with Round towards Zero converts a value in a register from floating-point to a 32-bit integer, using the Round towards Zero rounding mode, and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Single-precision scalar variant

Applies when `opc2 == 100 && sz == 0`.

```
VCVT{<c>}{<q>}.U32.F32 <Sd>, <Sm>
```

F6.1.58 VCVT (integer to floating-point, floating-point)

Convert integer to floating-point converts a 32-bit integer to floating-point using the rounding mode specified by the FPSCR, and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

F6.1.59 VCVT (between floating-point and fixed-point, Advanced SIMD)

Vector Convert between floating-point and fixed-point converts each element in a vector from floating-point to fixed-point, or from fixed-point to floating-point, and places the results in a second vector.

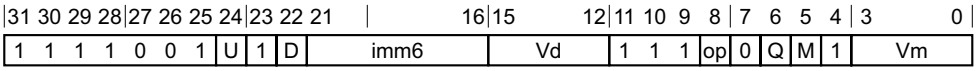
The vector elements must be 32-bit floating-point numbers, or 32-bit integers. Signed and unsigned integers are distinct.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `imm6 != 000xxx && Q == 0`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Dd>, <Dm>, #<fbits>
```

128-bit SIMD vector variant

Applies when `imm6 != 000xxx && Q == 1`.

```

if imm6 == '0xxxxx' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
to_fixed = (op == '1');  frac_bits = 64 - UInt(imm6);
unsigned = (U == '1');  esize = 32;  elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2375 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2463 for the A32 instruction set.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD `VCVT` instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD `VCVT` instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<dt1>` Is the data type for the elements of the destination vector, encoded in the "op:U" field. It can have the following values:

`F32`	when `op = 0, U = 0`
`F32`	when `op = 0, U = 1`
`S32`	when `op = 1, U = 0`
`U32`	when `op = 1, U = 1`

`<dt2>` Is the data type for the elements of the source vector, encoded in the "op:U" field. It can have the following values:

`S32`	when `op = 0, U = 0`
`U32`	when `op = 0, U = 1`
`F32`	when `op = 1, U = 0`
`F32`	when `op = 1, U = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

`<fbits>` The number of fraction bits in the fixed point number, in the range 1 to 32:

- (64 - `<fbits>`) is encoded in imm6.

An assembler can permit an `<fbits>` value of 0. This is encoded as floating-point to integer or integer to floating-point instruction, see VCVT (between floating-point and integer, Advanced SIMD).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
```

F6.1.60 VCVT (between floating-point and fixed-point, floating-point)

Convert between floating-point and fixed-point converts a value in a register from floating-point to fixed-point, or from fixed-point to floating-point. Software can specify the fixed-point value as either signed or unsigned.

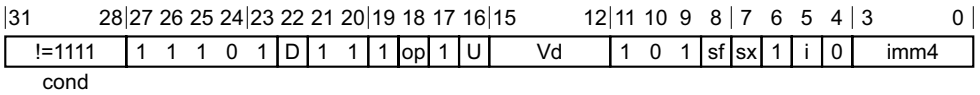
The floating-point value can be single-precision or double-precision.

The fixed-point value can be 16-bit or 32-bit. Conversions from fixed-point values take their operand from the low-order bits of the source register and ignore any remaining bits. Signed conversions to fixed-point values sign-extend the result value to the destination register width. Unsigned conversions to fixed-point values zero-extend the result value to the destination register width.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Single-precision scalar variant

Applies when `op == 0 && sf == 0`.

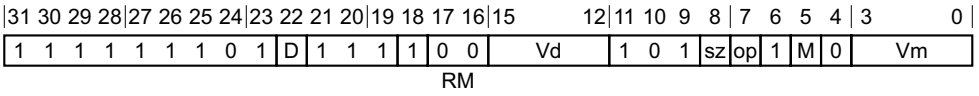
F6.1.62 VCVTA (floating-point)

Convert floating-point to integer with Round to Nearest with Ties to Away converts a value in a register from floating-point to a 32-bit integer using the Round to Nearest with Ties to Away rounding mode, and places the result in a second register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Single-precision scalar variant

Applies when `sz == 0`.

```
VCVTA{<q>}.<dt>.F32 <Sd>, <Sm>
```

Double-precision scalar variant

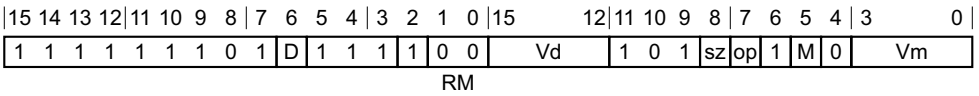
Applies when `sz == 1`.

```
VCVTA{<q>}.<dt>.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
rounding = FPDecodeRM(RM);  unsigned = (op == '0');  dp_operation = (sz == '1');
d = UInt(Vd:D);  m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

T1



Single-precision scalar variant

Applies when `sz == 0`.

```
VCVTA{<q>}.<dt>.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VCVTA{<q>}.<dt>.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
rounding = FPDecodeRM(RM);  unsigned = (op == '0');  dp_operation = (sz == '1');
d = UInt(Vd:D);  m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;

F6.1.63 VCVTB

Convert to or from a half-precision value in the bottom half of a single-precision register does one of the following:

- Converts the half-precision value in the bottom half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the bottom half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the bottom half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the bottom half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

Non-Confidential - Beta

<dt> Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:

U32 when op = 0

S32 when op = 1

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
if dp_operation then
    S[d] = FPToFixed(D[m], 0, unsigned, FPSCR, rounding);
else
    S[d] = FPToFixed(S[m], 0, unsigned, FPSCR, rounding);
```

F6.1.70 VCVTR

Convert floating-point to integer converts a value in a register from floating-point to a 32-bit integer, using the rounding mode specified by the FPSCR and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

F6.1.71 VCVTT

Convert to or from a half-precision value in the top half of a single-precision register does one of the following:

- Converts the half-precision value in the top half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the top half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. F6.1.73 VDUP (general-purpose register)

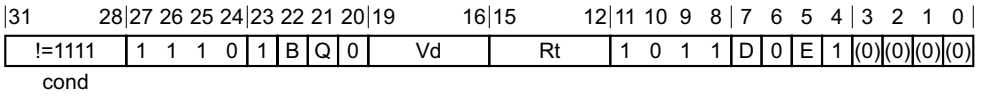
Duplicate general-purpose register to vector duplicates an element from a general-purpose register into every element of the destination vector.

The destination vector elements can be 8-bit, 16-bit, or 32-bit fields. The source element is the least significant 8, 16, or 32 bits of the general-purpose register. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



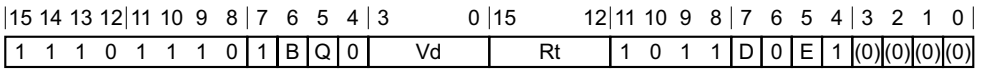
A1 variant

```
VDUP{<c>}{<q>}.<size> <Qd>, <Rt> // Encoded as Q = 1
VDUP{<c>}{<q>}.<size> <Dd>, <Rt> // Encoded as Q = 0
```

Decode for this encoding

```
if Q == '1' && Vd<0> == '1' then UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);  regs = if Q == '0' then 1 else 2;
case B:E of
    when '00'  esize = 32;  elements = 2;
    when '01'  esize = 16;  elements = 4;
    when '10'  esize = 8;   elements = 8;
    when '11'  UNDEFINED;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T1



T1 variant

```
VDUP{<c>}{<q>}.<size> <Qd>, <Rt> // Encoded as Q = 1
VDUP{<c>}{<q>}.<size> <Dd>, <Rt> // Encoded as Q = 0
```

Decode for this encoding

```
if Q == '1' && Vd<0> == '1' then UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);  regs = if Q == '0' then 1 else 2;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. ARM strongly recommends that any `VDUP` instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` The data size for the elements of the destination vector. It must be one of:

- `8` Encoded as [b, e] = `0b10`.
- `16` Encoded as [b, e] = `0b01`.
- `32` Encoded as [b, e] = `0b00`.

`<Qd>` The destination vector for a quadword operation.

`<Dd>` The destination vector for a doubleword operation.

`<Rt>` The ARM source register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    scalar = R[t]<esize-1:0>;
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = scalar;
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

F6.1.74 VDUP (scalar)

Duplicate vector element to vector duplicates a single element of a vector into every element of the destination vector.

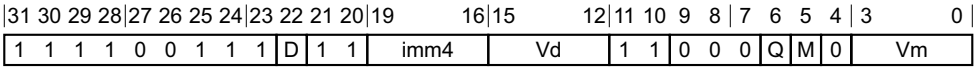
The scalar, and the destination vector elements, can be any one of 8-bit, 16-bit, or 32-bit fields. There is no distinction between data types.

For more information about scalars see *Advanced SIMD scalars* on page F2-2346.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



Encoding

Applies when `Q == 0`.

```
VDUP{<c>}{<q>}.<size> <Dd>, <Dm[x]>
```

Encoding

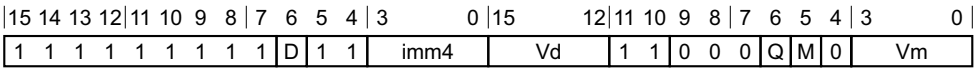
Applies when `Q == 1`.

```
VDUP{<c>}{<q>}.<size> <Qd>, <Dm[x]>
```

Decode for all variants of this encoding

```
if imm4 == 'x000' then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;
case imm4 of
    when "xxx1"  esize = 8;  elements = 8;  index = UInt(imm4<3:1>);
    when "xx10"  esize = 16;  elements = 4;  index = UInt(imm4<3:2>);
    when "x100"  esize = 32;  elements = 2;  index = UInt(imm4<3>);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



Encoding

Applies when `Q == 0`.

```
VDUP{<c>}{<q>}.<size> <Dd>, <Dm[x]>
```

Encoding

Applies when `Q == 1`.

```
VDUP{<c>}{<q>}.<size> <Qd>, <Dm[x]>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if imm4 == 'x000' then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;
case imm4 of
    when "xxx1"  esize = 8;  elements = 8;  index = UInt(imm4<3:1>);
    when "xx10"  esize = 16;  elements = 4;  index = UInt(imm4<3:2>);
    when "x100"  esize = 32;  elements = 2;  index = UInt(imm4<3>);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. An A32 `VDUP` instruction must be unconditional. ARM strongly recommends that a T32 `VDUP` instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` The data size. It must be one of:

- `8` Encoded as imm4<0> = '1'. imm4<3:1> encodes the index`[x]` of the scalar.
- `16` Encoded as imm4<1:0> = '10'. imm4<3:2> encodes the index `[x]` of the scalar.
- `32` Encoded as imm4<2:0> = '100'. imm4<3> encodes the index `[x]` of the scalar.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm[x]>` The scalar. For details of how `[x]` is encoded, see the description of `<size>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    scalar = Elem[D[m],index,esize];
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = scalar;
```

Non-Confidential - Beta

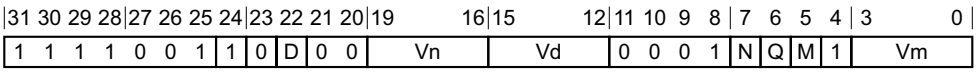
F6.1.75 VEOR

Vector Bitwise Exclusive OR performs a bitwise Exclusive OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEOR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

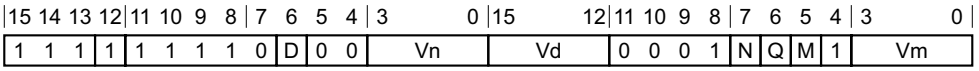
Applies when `Q == 1`.

```
VEOR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEOR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VEOR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

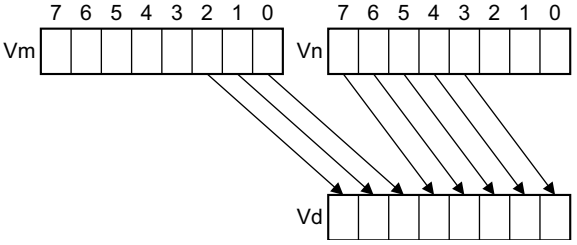
F6.1.76 VEXT (byte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

The elements of the vectors are treated as being 8-bit fields. There is no distinction between data types.

The following figure shows an example of the operation of VEXT doubleword operation for imm = 3.



Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

This instruction is used by the alias VEXT (multibyte elements). See the *Alias conditions* on page F6-3273 table for details of when each alias is preferred.

A1

31 30 29 28	27 26 25 24	23	22	21	20	19 16	15 12	11 8	7	6	5	4	3 0
1 1 1 1	0 0 1 0	1	D	1	1	Vn	Vd	imm4	N	Q	M	0	Vm

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if Q == '0' && imm4<3> == '1' then UNDEFINED;
quadword_operation = (Q == '1');  position = 8 * UInt(imm4);
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

```

Alias conditions

Alias	is preferred when
VEXT (multibyte elements)	Never

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VEXT instruction must be unconditional. ARM strongly recommends that a T32 VEXT instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<imm> For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 7, encoded in the "imm4" field.

For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 15, encoded in the "imm4" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    if quadword_operation then
        Q[d>>1] = (Q[m>>1]:Q[n>>1])<position+127:position>;
    else
        D[d] = (D[m]:D[n])<position+63:position>;
```

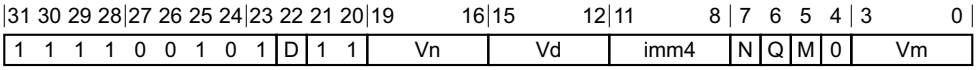
F6.1.77 VEXT (multibyte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector

This instruction is an alias of the VEXT (byte elements) instruction. This means that:

- The encodings in this description are named to match the encodings of VEXT (byte elements).
- The description of VEXT (byte elements) gives the operational pseudocode for this instruction.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.<size> {<Dd>,} <Dn>, <Dm>, #<imm>
```

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

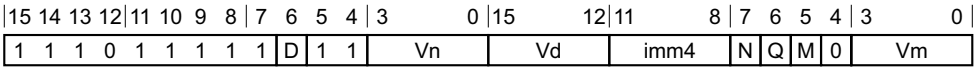
```
VEXT{<c>}{<q>}.<size> {<Qd>,} <Qn>, <Qm>, #<imm>
```

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.<size> {<Dd>,} <Dn>, <Dm>, #<imm>
```

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VEXT{<c>}{<q>}.<size> {<Qd>,} <Qn>, <Qm>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-2322. An A32 `VEXT` instruction must be unconditional. ARM strongly recommends that a T32 `VEXT` instruction is unconditional, see *Conditional execution* on page F2-2323.
`<q>`	See *Standard assembler syntax fields* on page F2-2322.
`<size>`	For the 64-bit SIMD vector variant: is the size of the operation, and can be one of 16 or 32. For the 128-bit SIMD vector variant: is the size of the operation, and can be one of 16, 32 or 64.
`<Qd>`	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
`<Qn>`	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
`<Qm>`	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
`<Dd>`	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
`<Dn>`	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
`<Dm>`	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
`<imm>`	For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (128/`<size>`)-1. For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (64/`<size>`)-1.

Operation for all encodings

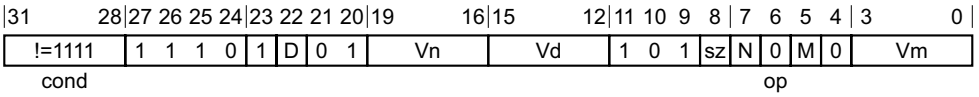
F6.1.81 VFNMS

Vector Fused Negate Multiply Subtract multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Single-precision scalar variant

Applies when `sz == 0`.

```
VFNMS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

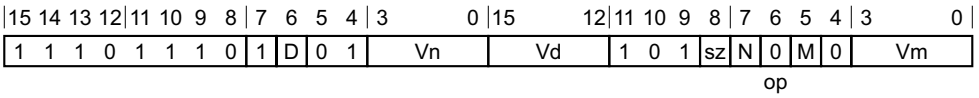
Applies when `sz == 1`.

```
VFNMS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
op1_neg = (op == '1');
dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

T1



Single-precision scalar variant

Applies when `sz == 0`.

```
VFNMS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VFNMS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
op1_neg = (op == '1');
dp_operation = (sz == '1');
```

F6.1.82 VHADD

Vector Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector. The results of the halving operations are truncated. For rounded results, see VRHADD).

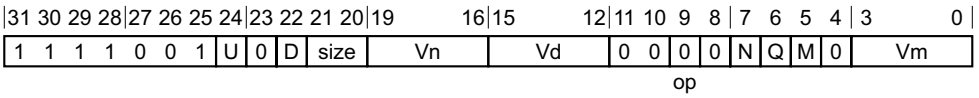
The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VHADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VHADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
add = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8`	when `size = 00`
`16`	when `size = 01`
`32`	when `size = 10`

`<list>` Is a list containing the single 64-bit name of the SIMD&FP register holding the element. The list must be `{ <Dd>[<index>] }`. The register `<Dd>` is encoded in the "D:Vd" field. The permitted values and encoding of `<index>` depend on `<size>`:

`<size> == 8`	`<index>` is in the range 0 to 7, encoded in the "index_align<3:1>" field.
`<size> == 16`	`<index>` is in the range 0 to 3, encoded in the "index_align<3:2>" field.
`<size> == 32`	`<index>` is 0 or 1, encoded in the "index_align<3>" field.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` When `<size>` == 8, `<align>` must be omitted, otherwise it is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and the encoding depends on `<size>`:

- `<size> == 8` Encoded in the "index_align<0>" field as `0`.
- `<size> == 16` Encoded in the "index_align<1:0>" field as `0b00`.
- `<size> == 32` Encoded in the "index_align<2:0>" field as `0b000`.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

- `<size> == 16` `<align>` is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as `0b01`.
- `<size> == 32` `<align>` is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as `0b011`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d],index] = MemU[address,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD1 (single element to all lanes)* on page K1-5352.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:

- `{ <Dd>[] }` Encoded in the "T" field as `0`.
- `{ <Dd>[], <Dd+1>[] }` Encoded in the "T" field as `1`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` When `<size>` == 8, `<align>` must be omitted, otherwise it is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and is encoded in the "a" field as `0`. Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

- `<size> == 16` `<align>` is 16, meaning 16-bit alignment, encoded in the "a" field as `1`.
- `<size> == 32` `<align>` is 32, meaning 32-bit alignment, encoded in the "a" field as `1`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    bits(64) replicated_element = Replicate(MemU[address,ebytes]);
    for r = 0 to regs-1
        D[d+r] = replicated_element;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

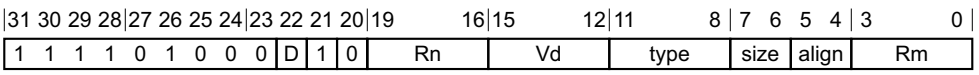
F6.1.86 VLD1 (multiple single elements)

Load multiple single 1-element structures to one, two, three, or four registers loads elements from memory into one, two, three, or four registers, without de-interleaving. Every element of each register is loaded. For details of the addressing mode see *Advanced SIMD addressing mode* on page F2-2341.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



Offset variant

Applies when `Rm == 1111`.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Immediate, post-indexed variant

Applies when `Rm == 1101`.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Register, post-indexed variant

Applies when `Rm != 11x1`.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD1 (multiple single elements)* on page K1-5351.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-2394 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-2469 for the A32 instruction set.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`
- `64` when `size = 11`

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:

`{ <Dd> }`
Encoded in the "type" field as `0b0111`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`{ <Dd>, <Dd+1> }`
: Encoded in the "type" field as `0b1010`.

`{ <Dd>, <Dd+1>, <Dd+2> }`
: Encoded in the "type" field as `0b0110`.

`{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }`
: Encoded in the "type" field as `0b0010`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and is encoded in the "align" field as `0b00`. Whenever `<align>` is present, the permitted values are:

`64` 64-bit alignment, encoded in the "align" field as `0b01`.

`128` 128-bit alignment, encoded in the "align" field as `0b10`. Available only if `<list>` contains two or four registers.

`256` 256-bit alignment, encoded in the "align" field as `0b11`. Available only if `<list>` contains four registers.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            bits(ebytes*8) data;
            if ebytes != 8 then
                data = MemU[address,ebytes];
            else
                data<31:0> = if BigEndian() then MemU[address+4,4] else MemU[address,4];
                data<63:32> = if BigEndian() then MemU[address,4] else MemU[address+4,4];
            Elem[D[d+r],e] = data;
            address = address + ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 8*regs;
```

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD2 (single 2-element structure to one lane)* on page K1-5352.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the two SIMD&FP registers holding the element. The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>] }`
Single-spaced registers, encoded as "spacing" = `0`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`{ <Dd>[<index>], <Dd+2>[<index>] }`

Double-spaced registers, encoded as "spacing" = 1. Not permitted when `<size>` == 8.

The encoding of "spacing" depends on `<size>`:

`<size> == 16` "spacing" is encoded in the "index_align<1>" field.

`<size> == 32` "spacing" is encoded in the "index_align<2>" field.

The register `<Dd>` is encoded in the "D:Vd" field. The permitted values and encoding of `<index>` depend on `<size>`:

`<size> == 8` `<index>` is in the range 0 to 7, encoded in the "index_align<3:1>" field.

`<size> == 16` `<index>` is in the range 0 to 3, encoded in the "index_align<3:2>" field.

`<size> == 32` `<index>` is 0 or 1, encoded in the "index_align<3>" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and the encoding depends on `<size>`:

`<size> == 8` Encoded in the "index_align<0>" field as `0`.

`<size> == 16` Encoded in the "index_align<0>" field as `0`.

`<size> == 32` Encoded in the "index_align<1:0>" field as `0b00`.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

`<size> == 8` `<align>` is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.

`<size> == 16` `<align>` is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

`<size> == 32` `<align>` is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as `0b01`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD2 (single 2-element structure to all lanes)* on page K1-5353.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of two SIMD&FP registers. The list must be one of:

`{ <Dd>[], <Dd+1>[] }` Single-spaced registers, encoded in the "T" field as `0`.

`{ <Dd>[], <Dd+2>[] }` Double-spaced registers, encoded in the "T" field as `1`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and is encoded in the "a" field as `0`. Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

`<size> == 8` `<align>` is 16, meaning 16-bit alignment, encoded in the "a" field as `1`.

`<size> == 16` `<align>` is 32, meaning 32-bit alignment, encoded in the "a" field as `1`.

`<size> == 32` `<align>` is 64, meaning 64-bit alignment, encoded in the "a" field as `1`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

    when '1001'
        regs = 1;  inc = 2;  if align == '11' then UNDEFINED;
    when '0011'
        regs = 2;  inc = 2;
    otherwise
        SEE "Related encodings";
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2+regs > 32 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD2 (multiple 2-element structures)* on page K1-5352.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-2394 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-2469 for the A32 instruction set.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:

`{ <Dd>, <Dd+1> }`
Single-spaced registers, encoded in the "type" field as `0b1000`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`{ <Dd>, <Dd+2> }`

Double-spaced registers, encoded in the "type" field as `0b1001`.

`{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }`

Single-spaced registers, encoded in the "type" field as `0b0011`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and is encoded in the "align" field as `0b00`. Whenever `<align>` is present, the permitted values are:

`64` 64-bit alignment, encoded in the "align" field as `0b01`.

`128` 128-bit alignment, encoded in the "align" field as `0b10`.

`256` 256-bit alignment, encoded in the "align" field as `0b11`. Available only if `<list>` contains four registers.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r], e] = MemU[address,ebytes];
            Elem[D[d2+r],e] = MemU[address+ebytes,ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
```

F6.1.90 VLD3 (single 3-element structure to one lane)

Load single 3-element structure to one lane of three registers loads one 3-element structure from memory into corresponding elements of three registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *Advanced SIMD addressing mode* on page F2-2341.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

if n == 15 || d3 > 31 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD3 (single 3-element structure to one lane)* on page K1-5353.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the three SIMD&FP registers holding the element. The list must be one of:

- `{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] }`
  Single-spaced registers, encoded as "spacing" = `0`.
- `{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] }`
  Double-spaced registers, encoded as "spacing" = 1. Not permitted when `<size>` == 8.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The encoding of "spacing" depends on <size>:

<size> == 8	"spacing" is encoded in the "index_align<0>" field.
<size> == 16	"spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0.
<size> == 32	"spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00.

The register <Dd> is encoded in the "D:Vd" field. The permitted values and encoding of <index> depend on <size>:

<size> == 8	<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16	<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32	<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Alignment

Standard alignment rules apply, see *Alignment support* on page B2-75.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    Elem[D[d3],index] = MemU[address+2*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
```

Offset variant

Applies when `Rm == 1111`.

```
VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when `Rm == 1101`.

```
VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when `Rm != 11x1`.

```
VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
if size == '11' then SEE VLD4 (single 4-element structure to all lanes);
case size of
    when '00'
        ebytes = 1;  index = UInt(index_align<3:1>);  inc = 1;
        alignment = if index_align<0> == '0' then 1 else 4;
    when '01'
        ebytes = 2;  index = UInt(index_align<3:2>);
        inc = if index_align<1> == '0' then 1 else 2;
        alignment = if index_align<0> == '0' then 1 else 8;
    when '10'
        if index_align<1:0> == '11' then UNDEFINED;
        ebytes = 4;  index = UInt(index_align<3>);
        inc = if index_align<2> == '0' then 1 else 2;
        alignment = if index_align<1:0> == '00' then 1 else 4 << UInt(index_align<1:0>);
d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  d4 = d3 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD4 (single 4-element structure to one lane)* on page K1-5354.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the four SIMD&FP registers holding the element. The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] }`
Single-spaced registers, encoded as "spacing" = `0`.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] }`
Double-spaced registers, encoded as "spacing" = 1. Not permitted when `<size>` == 8.

The encoding of "spacing" depends on `<size>`:

`<size> == 16` "spacing" is encoded in the "index_align<1>" field.

`<size> == 32` "spacing" is encoded in the "index_align<2>" field.

The register `<Dd>` is encoded in the "D:Vd" field. The permitted values and encoding of `<index>` depend on `<size>`:

`<size> == 8` `<index>` is in the range 0 to 7, encoded in the "index_align<3:1>" field.

`<size> == 16` `<index>` is in the range 0 to 3, encoded in the "index_align<3:2>" field.

`<size> == 32` `<index>` is 0 or 1, encoded in the "index_align<3>" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment. Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-2239, and the encoding depends on `<size>`:

`<size> == 8` Encoded in the "index_align<0>" field as `0`.

`<size> == 16` Encoded in the "index_align<0>" field as `0`.

`<size> == 32` Encoded in the "index_align<1:0>" field as `0b00`.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

`<size> == 8` `<align>` is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

`<size> == 16` `<align>` is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.

`<size> == 32` `<align>` can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as `0b01`, and 128-bit alignment is encoded in the "index_align<1:0>" field as `0b10`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *Advanced SIMD addressing mode* on page F2-2341.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode* on page F2-2341.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    Elem[D[d3],index] = MemU[address+2*ebytes,ebytes];
    Elem[D[d4],index] = MemU[address+3*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD4 (single 4-element structure to all lanes)* on page K1-5355.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. This instruction must be unconditional in A32. ARM strongly recommends that this instruction is unconditional in T32, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 1x`

`<list>` Is a list containing the 64-bit names of four SIMD&FP registers. The list must be one of:

`{ <Dd>[], <Dd+1>[], <Dd+2>[], <Dd+3>[] }`
Single-spaced registers, encoded in the "T" field as `0`.

`{ <Dd>[], <Dd+2>[], <Dd+4>[], <Dd+6>[] }`
Double-spaced registers, encoded in the "T" field as `1`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLDM* on page K1-5355.

Related encodings: See *Advanced SIMD and floating-point 64-bit move* on page F3-2363 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-2446 for the A32 instruction set.

Alias conditions

Alias	is preferred when
VPOP	`P == '0' && U == '1' && W == '1' && Rn == '1101'`

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<size>	An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
<Rn>	For encoding A1 and A2: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
!	Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
<sreglist>	Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
<dreglist>	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4];  address = address+4;
        else
            word1 = MemA[address,4];  word2 = MemA[address+4,4];  address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

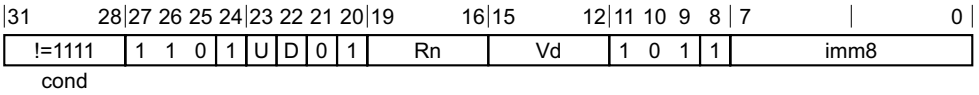
F6.1.97 VLDR

Load SIMD&FP register loads a single register from the Advanced SIMD and floating-point register file, using an address from a general-purpose register, with an optional offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Literal variant

Applies when `Rn == 1111`.

```
VLDR{<c>}{<q>}{.64} <Dd>, <label>
VLDR{<c>}{<q>}{.64} <Dd>, [PC, #{+/-}<imm>]
```

Offset variant

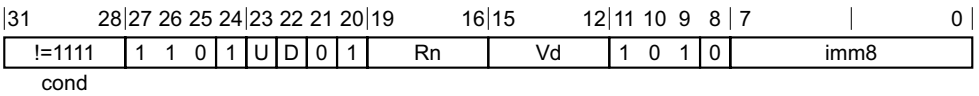
Applies when `Rn != 1111`.

```
VLDR{<c>}{<q>}{.64} <Dd>, [<Rn> {, #{+/-}<imm>}]
```

Decode for all variants of this encoding

```
single_reg = FALSE;  add = (U == '1');  imm32 = ZeroExtend(imm8:'00', 32);
d = UInt(D:Vd);  n = UInt(Rn);
```

A2



Literal variant

Applies when `Rn == 1111`.

```
VLDR{<c>}{<q>}{.32} <Sd>, <label>
VLDR{<c>}{<q>}{.32} <Sd>, [PC, #{+/-}<imm>]
```

Offset variant

Applies when `Rn != 1111`.

```
VLDR{<c>}{<q>}{.32} <Sd>, [<Rn> {, #{+/-}<imm>}]
```

Decode for all variants of this encoding

```
single_reg = TRUE;  add = (U == '1');  imm32 = ZeroExtend(imm8:'00', 32);
d = UInt(Vd:D);  n = UInt(Rn);
```

Non-Confidential - Beta

<label> The label of the literal data item to be loaded. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, imm32 is equal to the offset and add == TRUE. If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

<imm> The immediate offset used for forming the address. For the immediate forms of the syntax, <imm> can be omitted, in which case the #0 form of the instruction is assembled. Permitted values are multiples of 4 in the range 0 to 1020.

For the literal forms of the instruction, the base register is encoded as 0b1111 to indicate that the PC is the base register.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2285.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    if single_reg then
        S[d] = MemA[address,4];
    else
        word1 = MemA[address,4];  word2 = MemA[address+4,4];
        // Combine the word-aligned words in the correct order for current endianness.
        D[d] = if BigEndian() then word1:word2 else word2:word1;
```

F6.1.98 VMAX (floating-point)

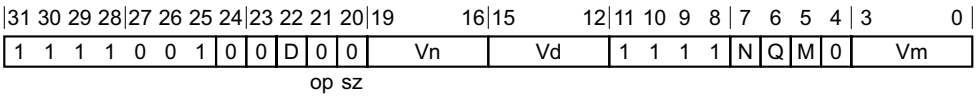
Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements are 32-bit floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMAX{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

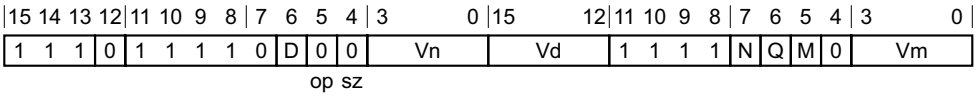
Applies when `Q == 1`.

```
VMAX{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMAX{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMAX{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322. An A32 VMAX or VMIN instruction must be unconditional. ARM strongly recommends that a T32 VMAX or VMIN instruction is unconditional, see *Conditional execution* on page F2-2323.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point maximum and minimum

- max(+0.0, -0.0) = +0.0
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
```

F6.1.99 VMAX (integer)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

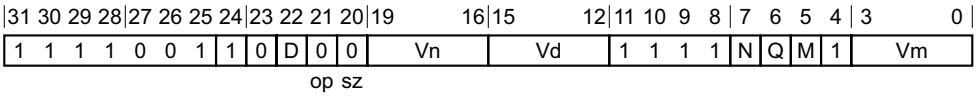
F6.1.100 VMAXNM

This instruction determines the floating-point maximum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMAX.

This instruction is not conditional.

A1



64-bit SIMD vector variant

Applies when Q == 0.

```

F6.1.101 VMIN (floating-point)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements are 32-bit floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VMAX or VMIN instruction must be unconditional. ARM strongly recommends that a T32 VMAX or VMIN instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point maximum and minimum

- min(+0.0, -0.0) = -0.0
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
```

F6.1.102 VMIN (integer)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

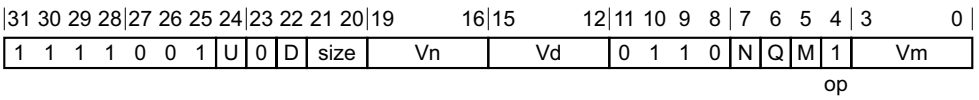
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

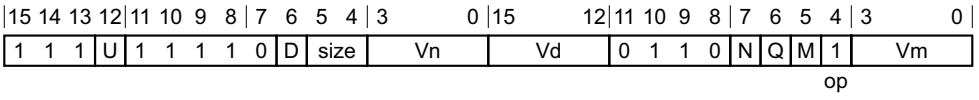
Applies when `Q == 1`.

```
VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

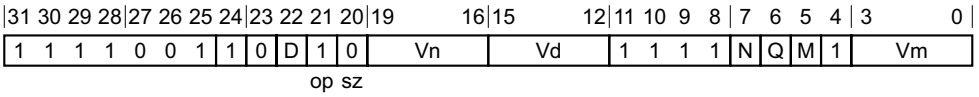
F6.1.103 VMINNM

This instruction determines the floating point minimum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point `VMIN`.

This instruction is not conditional.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMINNM{<q>}.F32 <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant

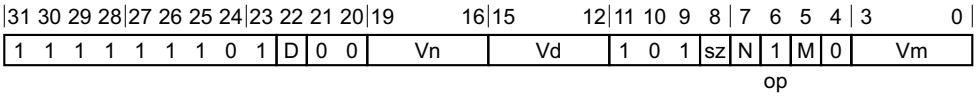
Applies when `Q == 1`.

```
VMINNM{<q>}.F32 <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE; esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
if InITBlock() then UNPREDICTABLE;
```

A2



Single-precision scalar variant

Applies when `sz == 0`.

```
VMINNM{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VMINNM{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
advsimd = FALSE;
maximum = (op == '0'); dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

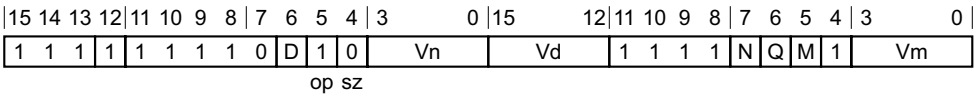
T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMINNM{<q>}.F32 <Dd>, <Dn>, <Dm> // Not permitted in IT block
```

128-bit SIMD vector variant

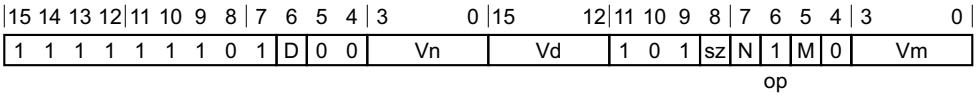
Applies when `Q == 1`.

```
VMINNM{<q>}.F32 <Qd>, <Qn>, <Qm> // Not permitted in IT block
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE; esize = 32; elements = 2;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
if InITBlock() then UNPREDICTABLE;
```

T2



Single-precision scalar variant

Applies when `sz == 0`.

```
VMINNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VMINNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Not permitted in IT block
```

Decode for all variants of this encoding

```
advsimd = FALSE;
maximum = (op == '0'); dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

F6.1.106 VMLA (by scalar)

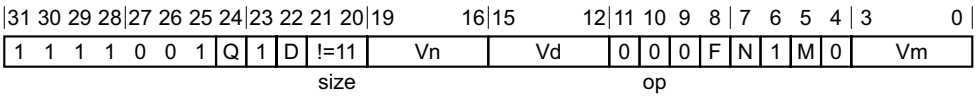
Vector Multiply Accumulate multiplies elements of a vector by a scalar, and adds the products to corresponding elements of the destination vector.

For more information about scalars see *Advanced SIMD scalars* on page F2-2346.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLA{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 0
```

128-bit SIMD vector variant

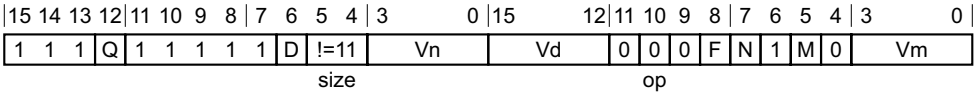
Applies when `Q == 1`.

```
VMLA{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 1
```

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
add = (op == '0');  floating_point = (F == '1');  long_destination = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLA{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 0
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMLA{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 1
```

```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-2369 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-2457 for the A32 instruction set.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD `VMLA`, `VMLAL`, `VMLS`, or `VMLSL` instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD `VMLA`, `VMLAL`, `VMLS`, or `VMLSL` instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<type>` The data type for the elements of the operands. It must be one of:

- `S` Encoding T2/A2, encoded as U = 0.
- `U` Encoding T2/A2, encoded as U = 1.
- `I` Encoding T1/A1, encoded as F = 0.
- `F` Encoding T1/A1, encoded as F = 1. `<size>` must be 32.

`<size>` The operand element data size. It can be:

- `16` Encoded as size = 01.
- `32` Encoded as size = 10.

`<Qd>` Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` The scalar. `Dm` is restricted to D0-D7 if `<size>` is 16, or D0-D15 otherwise.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                fp_addend = if add then FPMul(op1,op2,StandardFPSCRValue()) else
FPNeg(FPMul(op1,op2,StandardFPSCRValue()));
                Elem[D[d+r],e,esize] = FPAdd(Elem[Din[d+r],e,esize], fp_addend, StandardFPSCRValue());
            else
```

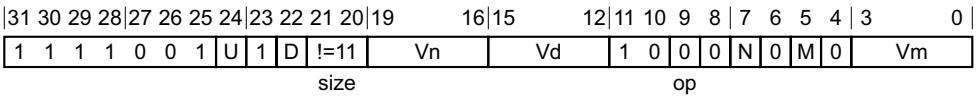
F6.1.107 VMLAL (integer)

Vector Multiply Accumulate Long multiplies corresponding elements in two vectors, and add the products to the corresponding element of the destination vector. The destination vector element is twice as long as the elements that are multiplied.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



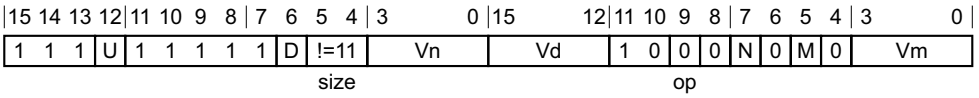
A1 variant

```
VMLAL{<c>}{<q>}.<type><size> <Qd>, <Dn>, <Dm> // Encoding T2/A2
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
add = (op == '0');  long_destination = TRUE;  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

T1



T1 variant

```
VMLAL{<c>}{<q>}.<type><size> <Qd>, <Dn>, <Dm> // Encoding T2/A2
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
add = (op == '0');  long_destination = TRUE;  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

Notes for all encodings

<q> See *Standard assembler syntax fields* on page F2-2322.

<type> The data type for the elements of the operands. It must be one of:

S Optional in encoding T1/A1. Encoded as U = 0 in encoding T2/A2.

U Optional in encoding T1/A1. Encoded as U = 1 in encoding T2/A2.

I Available only in encoding T1/A1.

<size> The data size for the elements of the operands. It must be one of:

8 Encoded as size = 0b00.

16 Encoded as size = 0b01.

32 Encoded as size = 0b10.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            product = Int(Elem[Din[n+r],e,esize],unsigned) * Int(Elem[Din[m+r],e,esize],unsigned);
            addend = if add then product else -product;

F6.1.109 VMLS (floating-point)

Vector Multiply Subtract multiplies corresponding elements in two vectors, subtracts the products from corresponding elements of the destination vector, and places the results in the destination vector.

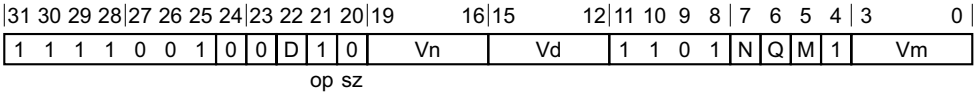
Note

ARM recommends that software does not use the VMLS instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when Q == 0.

```
VMLS{<c>}{<q>}.F32 <Dd>, <Dn>, <Dm> // Encoding T1/A1, encoded as Q = 0, sz = 0
```

128-bit SIMD vector variant

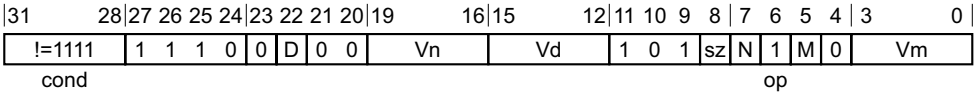
Applies when Q == 1.

```
VMLS{<c>}{<q>}.F32 <Qd>, <Qn>, <Qm> // Encoding T1/A1, encoded as Q = 1, sz = 0
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
advsimd = TRUE;  add = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2



Single-precision scalar variant

Applies when sz == 0.

```
VMLS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when sz == 1.

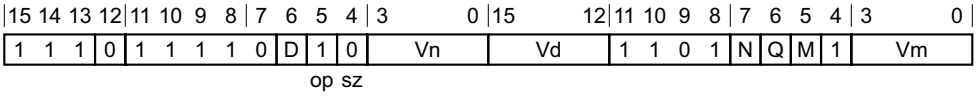
```
VMLS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE;  dp_operation = (sz == '1');  add = (op == '0');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLS{<c>}{<q>}.F32 <Dd>, <Dn>, <Dm> // Encoding T1/A1, encoded as Q = 0, sz = 0
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMLS{<c>}{<q>}.F32 <Qd>, <Qn>, <Qm> // Encoding T1/A1, encoded as Q = 1, sz = 0
```

Decode for all variants of this encoding

```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD VMLA, VMLAL, VMLS, or VMLSL instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VMLA, VMLAL, VMLS, or VMLSL instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<type> The data type for the elements of the operands. It must be one of:

- S — Optional in encoding T1/A1. Encoded as U = 0 in encoding T2/A2.
- U — Optional in encoding T1/A1. Encoded as U = 1 in encoding T2/A2.
- I — Available only in encoding T1/A1.

<size> The data size for the elements of the operands. It must be one of:

- 8 — Encoded as size = 0b00.
- 16 — Encoded as size = 0b01.
- 32 — Encoded as size = 0b10.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            product = Int(Elem[Din[n+r],e,esize],unsigned) * Int(Elem[Din[m+r],e,esize],unsigned);
            addend = if add then product else -product;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
            else
                Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

F6.1.111 VMLS (by scalar)

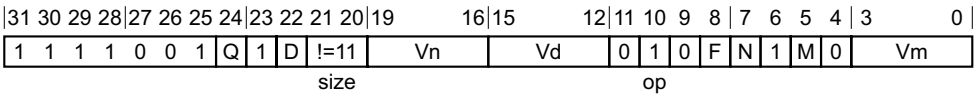
Vector Multiply Subtract multiplies elements of a vector by a scalar, and either subtracts the products from corresponding elements of the destination vector.

For more information about scalars see *Advanced SIMD scalars* on page F2-2346.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLS{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 0
```

128-bit SIMD vector variant

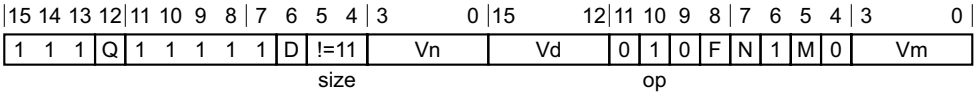
Applies when `Q == 1`.

```
VMLS{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 1
```

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
add = (op == '0');  floating_point = (F == '1');  long_destination = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLS{<c>}{<q>}.<type><size> <Dd>, <Dn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 0
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMLS{<c>}{<q>}.<type><size> <Qd>, <Qn>, <Dm[x]> // Encoding T1/A1, encoded as Q = 1
```

```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-2369 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-2457 for the A32 instruction set.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD `VMLA`, `VMLAL`, `VMLS`, or `VMLSL` instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD `VMLA`, `VMLAL`, `VMLS`, or `VMLSL` instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<type>` The data type for the elements of the operands. It must be one of:

- `S` Encoding T2/A2, encoded as U = 0.
- `U` Encoding T2/A2, encoded as U = 1.
- `I` Encoding T1/A1, encoded as F = 0.
- `F` Encoding T1/A1, encoded as F = 1. `<size>` must be 32.

`<size>` The operand element data size. It can be:

- `16` Encoded as size = 01.
- `32` Encoded as size = 10.

`<Qd>` Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` The scalar. `Dm` is restricted to D0-D7 if `<size>` is 16, or D0-D15 otherwise.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                fp_addend = if add then FPMul(op1,op2,StandardFPSCRValue()) else
FPNeg(FPMul(op1,op2,StandardFPSCRValue()));
                Elem[D[d+r],e,esize] = FPAdd(Elem[Din[d+r],e,esize], fp_addend, StandardFPSCRValue());
            else
```

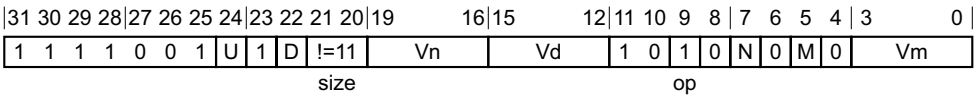
F6.1.112 VMLSL (integer)

Vector Multiply Subtract Long multiplies corresponding elements in two vectors, and subtract the products from the corresponding elements of the destination vector. The destination vector element is twice as long as the elements that are multiplied.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



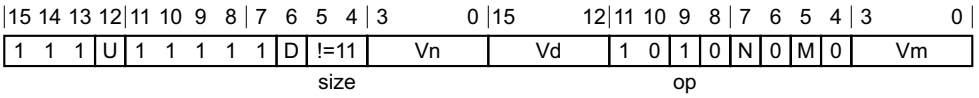
A1 variant

```
VMLSL{<c>}{<q>}.<type><size> <Qd>, <Dn>, <Dm> // Encoding T2/A2
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
add = (op == '0');  long_destination = TRUE;  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

T1



T1 variant

```
VMLSL{<c>}{<q>}.<type><size> <Qd>, <Dn>, <Dm> // Encoding T2/A2
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
add = (op == '0');  long_destination = TRUE;  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

Notes for all encodings

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2375 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2463 for the A32 instruction set.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD `VMOV` (immediate) instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD `VMOV` (immediate) instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<dt>` The data type. It must be one of `I8`, `I16`, `I32`, `I64`, or `F32`.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Sd>` Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

`<imm>` For encoding A1 and T1: is a constant of the type specified by `<dt>` that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<dt>` and `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2338.

For encoding A2 and T2: is a floating-point constant. For details of the range of constants available and the encoding of `<imm>`, see *Modified immediate constants in T32 and A32 floating-point instructions* on page F2-2339.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if single_register then
        S[d] = imm32;
    else
        for r = 0 to regs-1
            D[d+r] = imm64;
```

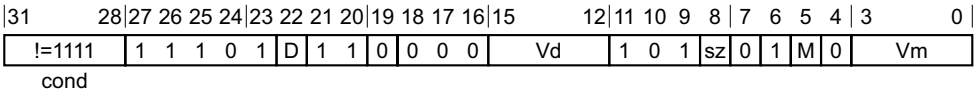
F6.1.116 VMOV (register)

Copy between FP registers copies the contents of one FP register to another.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A2



Single-precision scalar variant

Applies when `sz == 0`.

```
VMOV{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

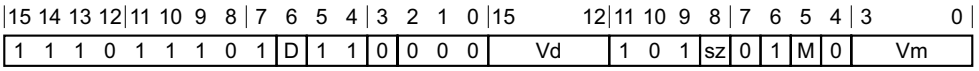
Applies when `sz == 1`.

```
VMOV{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
single_register = (sz == '0');  advsimd = FALSE;
if single_register then
    d = UInt(Vd:D);  m = UInt(Vm:M);
else
    d = UInt(D:Vd);  m = UInt(M:Vm);  regs = 1;
```

T2



Single-precision scalar variant

Applies when `sz == 0`.

```
VMOV{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VMOV{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
single_register = (sz == '0');  advsimd = FALSE;
if single_register then
```

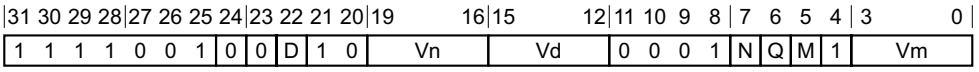
F6.1.117 VMOV (register, SIMD)

Copy between SIMD registers copies the contents of one SIMD register to another

This instruction is an alias of the VORR (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (register).
- The description of VORR (register) gives the operational pseudocode for this instruction.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMOV{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is the preferred disassembly when `N:Vn == M:Vm`.

128-bit SIMD vector variant

Applies when `Q == 1`.

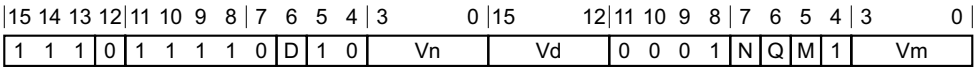
```
VMOV{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

and is the preferred disassembly when `N:Vn == M:Vm`.

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMOV{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is the preferred disassembly when `N:Vn == M:Vm`.

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMOV{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

`VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>`

and is the preferred disassembly when `N:Vn == M:Vm`.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD `VMOV` (register) instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD `VMOV` (register) instruction is unconditional, see *Conditional execution* on page F2-2323.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<dt>` An optional data type. `<dt>` must not be `F64`, but it is otherwise ignored.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation for all encodings

The description of VORR (register) gives the operational pseudocode for this instruction.

Non-Confidential - Beta

F6.1.118 VMOV (general-purpose register to scalar)

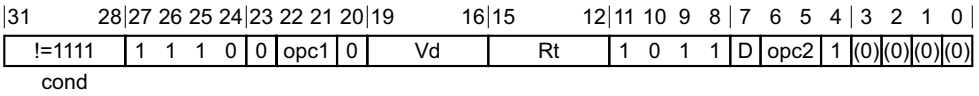
Copy a general-purpose register to a vector element copies a byte, halfword, or word from a general-purpose register into an Advanced SIMD scalar.

On a Floating-point-only system, this instruction transfers one word to the upper or lower half of a double-precision floating-point register from a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see *Advanced SIMD scalars* on page F2-2346.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



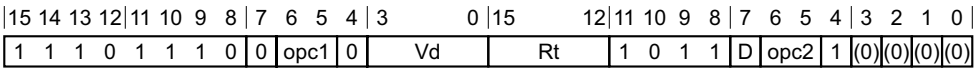
A1 variant

```
VMOV{<c>}{<q>}{.<size>} <Dd[x]>, <Rt>
```

Decode for this encoding

```
case opc1:opc2 of
    when "1xxx"  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when "0xx1"  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when "0x00"  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when "0x10"  UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T1



T1 variant

```
VMOV{<c>}{<q>}{.<size>} <Dd[x]>, <Rt>
```

Decode for this encoding

```
case opc1:opc2 of
    when "1xxx"  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when "0xx1"  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when "0x00"  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when "0x10"  UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential - Beta

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<size>` The data size. It must be one of:

`8`	Encoded as `opc1<1>` = 1. `[x]` is encoded in `opc1<0>`, `opc2`.
`16`	Encoded as `opc1<1>` = 0, `opc2<0>` = 1. `[x]` is encoded in `opc1<0>`, `opc2<1>`.
`32`	Encoded as `opc1<1>` = 0, `opc2` = `0b00`. `[x]` is encoded in `opc1<0>`.
`omitted`	Equivalent to `32`.

`<Dd[x]>` The scalar. The register `<Dd>` is encoded in D:Vd. For details of how `[x]` is encoded, see the description of `<size>`.

`<Rt>` The source general-purpose register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    Elem[D[d],index,esize] = R[t]<esize-1:0>;
```

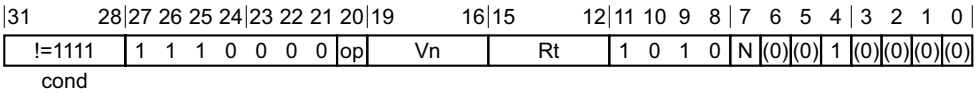
Non-Confidential - Beta

F6.1.119 VMOV (between general-purpose register and single-precision register)

Copy a general-purpose register to or from a 32-bit SIMD&FP register transfers the contents of a single-precision Floating-point register to a general-purpose register, or the contents of a general-purpose register to a single-precision Floating-point register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Encoding

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Sn>
```

Encoding

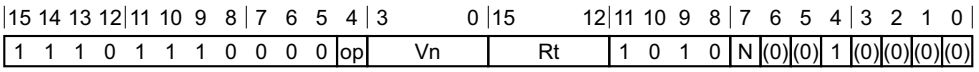
Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sn>, <Rt>
```

Decode for all variants of this encoding

```
to_arm_register = (op == '1');  t = UInt(Rt);  n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T1



Encoding

Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sn>, <Rt>
```

Encoding

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Sn>
```

Decode for all variants of this encoding

```
to_arm_register = (op == '1');  t = UInt(Rt);  n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential - Beta

Assembler symbols

<Rt> Is the general-purpose register that <Sn> will be transferred to or from, encoded in the "Rt" field.

<Sn> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Vn:N" field.

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    if to_arm_register then
        R[t] = S[n];
    else
        S[n] = R[t];
```

F6.1.120 VMOV (scalar to general-purpose register)

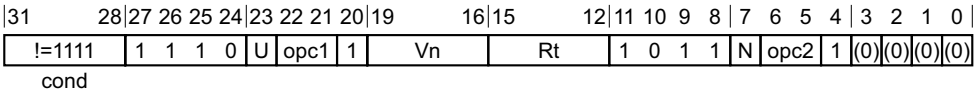
Copy a vector element to a general-purpose register with sign or zero extension copies a byte, halfword, or word from an Advanced SIMD scalar to a general-purpose register. Bytes and halfwords can be either zero-extended or sign-extended.

On a Floating-point-only system, this instruction transfers one word from the upper or lower half of a double-precision floating-point register to a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see *Advanced SIMD scalars* on page F2-2346.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



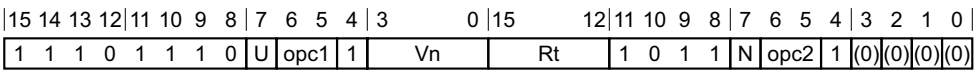
A1 variant

```
VMOV{<c>}{<q>}{.<dt>} <Rt>, <Dn[x]>
```

Decode for this encoding

```
case U:opc1:opc2 of
    when "x1xxx"  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when "x0xx1"  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when "00x00"  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when "10x00"  UNDEFINED;
    when "x0x10"  UNDEFINED;
t = UInt(Rt);  n = UInt(N:Vn);  unsigned = (U == '1');
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T1



T1 variant

```
VMOV{<c>}{<q>}{.<dt>} <Rt>, <Dn[x]>
```

Decode for this encoding

```
case U:opc1:opc2 of
    when "x1xxx"  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when "x0xx1"  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when "00x00"  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when "10x00"  UNDEFINED;
    when "x0x10"  UNDEFINED;
t = UInt(Rt);  n = UInt(N:Vn);  unsigned = (U == '1');
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Non-Confidential - Beta

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

`<dt>` The data type. It must be one of:

`S8`	Encoded as U = 0, `opc1<1>` = 1. `[x]` is encoded in `opc1<0>`, `opc2`.
`S16`	Encoded as U = 0, `opc1<1>` = 0, `opc2<0>` = 1. `[x]` is encoded in `opc1<0>`, `opc2<1>`.
`U8`	Encoded as U = 1, `opc1<1>` = 1. `[x]` is encoded in `opc1<0>`, `opc2`.
`U16`	Encoded as U = 1, `opc1<1>` = 0, `opc2<0>` = 1. `[x]` is encoded in `opc1<0>`, `opc2<1>`.
`32`	Encoded as U = 0, `opc1<1>` = 0, `opc2` = `0b00`. `[x]` is encoded in `opc1<0>`.
`omitted`	Equivalent to `32`.

`<Rt>` The destination general-purpose register.

`<Dn[x]>` The scalar. For details of how `[x]` is encoded see the description of `<dt>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if unsigned then
        R[t] = ZeroExtend(Elem[D[n],index,esize], 32);
    else
        R[t] = SignExtend(Elem[D[n],index,esize], 32);
```

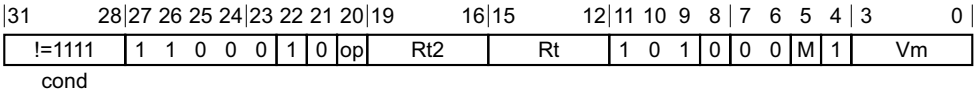
Non-Confidential - Beta

F6.1.121 VMOV (between two general-purpose registers and two single-precision registers)

Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers transfers the contents of two consecutively numbered single-precision Floating-point registers to two general-purpose registers, or the contents of two general-purpose registers to a pair of single-precision Floating-point registers. The general-purpose registers do not have to be contiguous.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Encoding

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>
```

Encoding

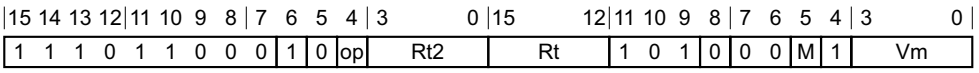
Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>
```

Decode for all variants of this encoding

```
to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if CurrentInstrSet() != InstrSet_A32 && (t == 13 || t2 == 13) then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

T1



Encoding

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>
```

Encoding

Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>
```

Decode for all variants of this encoding

```
to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if CurrentInstrSet() != InstrSet_A32 && (t == 13 || t2 == 13) then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VMOV (between two general-purpose registers and two single-precision registers)* on page K1-5356.

Assembler symbols

`<Rt2>` Is the second general-purpose register that `<Sm1>` will be transferred to or from, encoded in the "Rt" field.

`<Rt>` Is the first general-purpose register that `<Sm>` will be transferred to or from, encoded in the "Rt" field.

`<Sm1>` Is the 32-bit name of the second SIMD&FP register to be transferred. This is the next SIMD&FP register after `<Sm>`.

`<Sm>` Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Vm:M" field.

`<c>` See *Standard assembler syntax fields* on page F2-2322.

`<q>` See *Standard assembler syntax fields* on page F2-2322.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    if to_arm_registers then
        R[t] = S[m];
        R[t2] = S[m+1];
    else
        S[m] = R[t];
        S[m+1] = R[t2];
```

Non-Confidential - Beta

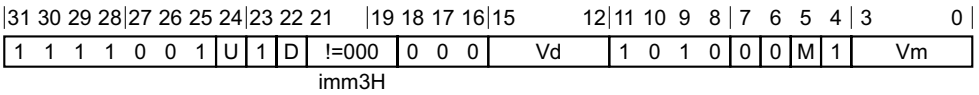
F6.1.122 VMOVL

Vector Move Long takes each element in a doubleword vector, sign or zero-extends them to twice their original length, and places the results in a quadword vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



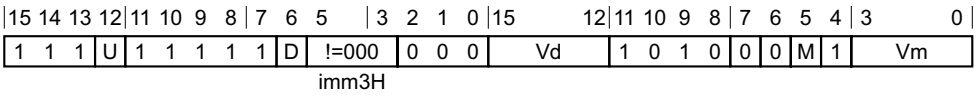
A1 variant

```
VMOVL{<c>}{<q>}.<dt> <Qd>, <Dm>
```

Decode for this encoding

```
if imm3H == '000' then SEE "Related encodings";
if imm3H != '001' && imm3H != '010' && imm3H != '100' then SEE VSHLL;
if Vd<0> == '1' then UNDEFINED;
esize = 8 * UInt(imm3H);
unsigned = (U == '1');  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1



T1 variant

```
VMOVL{<c>}{<q>}.<dt> <Qd>, <Dm>
```

Decode for this encoding

```
if imm3H == '000' then SEE "Related encodings";
if imm3H != '001' && imm3H != '010' && imm3H != '100' then SEE VSHLL;
if Vd<0> == '1' then UNDEFINED;
esize = 8 * UInt(imm3H);
unsigned = (U == '1');  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2375 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2463 for the A32 instruction set.

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VMOVL instruction must be unconditional. ARM strongly recommends that a T32 VMOVL instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> The data type for the elements of the operand. It must be one of:

- S8 Encoded as U = 0, imm3H = 0b001.
- S16 Encoded as U = 0, imm3H = 0b010.
- S32 Encoded as U = 0, imm3H = 0b100.
- U8 Encoded as U = 1, imm3H = 0b001.
- U16 Encoded as U = 1, imm3H = 0b010.
- U32 Encoded as U = 1, imm3H = 0b100.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = Int(Elem[Din[m],e,esize], unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

Non-Confidential - Beta

F6.1.123 VMOVN

Vector Move and Narrow copies the least significant half of each element of a quadword vector into the corresponding elements of a doubleword vector.

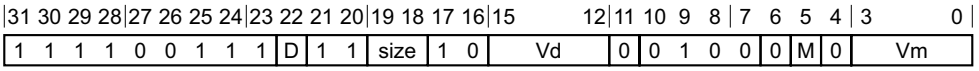
The operand vector elements can be any one of 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

This instruction is used by the aliases VRSHRN (zero) and VSHRN (zero). See the *Alias conditions* on page F6-3390 table for details of when each alias is preferred.

A1



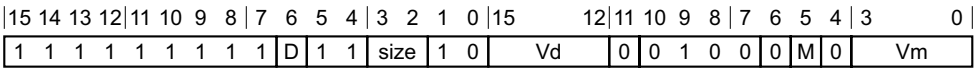
A1 variant

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
if Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1



T1 variant

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
if Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

Alias conditions

Alias	is preferred when
VRSHRN (zero)	Never
VSHRN (zero)	Never

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VMOVN instruction must be unconditional. ARM strongly recommends that a T32 VMOVN instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

I16 when size = 00

I32 when size = 01

I64 when size = 10

The encoding size = 11 is reserved.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        Elem[D[d],e,esize] = Elem[Qin[m>>1],e,2*esize]<esize-1:0>;
```

F6.1.124 VMRS

Move SIMD&FP Special register to general-purpose register moves the value of an Advanced SIMD and floating-point System register to a general-purpose register. When the specified System register is the FPSCR, a form of the instruction transfers the FPSCR.{N, Z, C, V} condition flags to the APSR.{N, Z, C, V} condition flags.

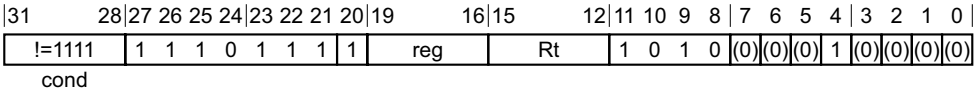
Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

When these settings permit the execution of floating-point and Advanced SIMD instructions, if the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.

In an implementation that includes EL2, when HCR.TID0 is set to 1, any VMRS access to FPSID from a Non-secure EL1 mode that would be permitted if HCR.TID0 was set to 0 generates a Hyp Trap exception. For more information, see *ID group 0, Primary device identification registers* on page G1-3759.

For simplicity, the VMRS pseudocode does not show the possible trap to Hyp mode.

A1



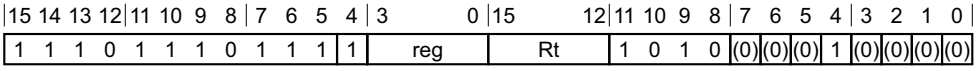
A1 variant

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

Decode for this encoding

```
t = UInt(Rt);
if !(reg IN {'000x', '0101', '011x', '1000'}) then UNPREDICTABLE;
if t == 15 && reg != '0001' then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T1



T1 variant

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

Decode for this encoding

```
t = UInt(Rt);
if !(reg IN {'000x', '0101', '011x', '1000'}) then UNPREDICTABLE;
if t == 15 && reg != '0001' then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VMRS* on page K1-5357.

Non-Confidential - Beta

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322.

<q> See *Standard assembler syntax fields* on page F2-2322.

<Rt> Is the general-purpose destination register, encoded in the "Rt" field. Is one of:

R0-R14 General-purpose register.

APSR_nzcv Permitted only when <spec_reg> is FPSCR. Encoded as 0b1111.
The instruction transfers the FPSCR.{N, Z, C, V} condition flags to the APSR.{N, Z, C, V} condition flags.

<spec_reg> Is the source Advanced SIMD and floating-point System register, encoded in the "reg" field. It can have the following values:

FPSID encoded as reg = 0000

FPSCR encoded as reg = 0001

MVFR2 encoded as reg = 0101

MVFR1 encoded as reg = 0110

MVFR0 encoded as reg = 0111

FPEXC encoded as reg = 1000

Other encodings are reserved.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if reg == '0001' then                 // FPSCR
        CheckVFPEnabled(TRUE);
        if t == 15 then
            PSTATE.<N,Z,C,V> = FPSR.<N,Z,C,V>;
        else
            R[t] = FPSCR;
    elsif PSTATE.EL == EL0 then
        UNDEFINED;                        // Non-FPSCR registers accessible only at PL1 or above
    else
        CheckVFPEnabled(FALSE);           // Non-FPSCR registers are not affected by FPEXC.EN
        case reg of
            // Pseudocode does not consider possible HCR.TIDn Hyp Traps of Non-secure register reads
            when '0000'  R[t] = FPSID;
            when '0101'  R[t] = MVFR2;
            when '0110'  R[t] = MVFR1;
            when '0111'  R[t] = MVFR0;
            when '1000'  R[t] = FPEXC;
            otherwise    Unreachable();   // Dealt with above or in encoding-specific pseudocode
```

F6.1.125 VMSR

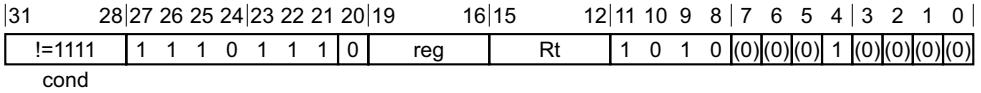
Move general-purpose register to SIMD&FP Special register moves the value of a general-purpose register to a floating-point System register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

When these settings permit the execution of floating-point and Advanced SIMD instructions:

- If the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.
- If the specified floating-point System register is the FPEXC and the instruction is executed in a mode other than User mode the instruction is ignored.

A1



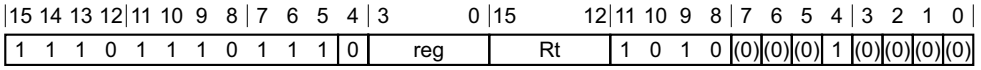
A1 variant

```
VMSR{<c>}{<q>} <spec_reg>, <Rt>
```

Decode for this encoding

```
t = UInt(Rt);
if reg != '000x' && reg != '1000' then UNPREDICTABLE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

T1



T1 variant

```
VMSR{<c>}{<q>} <spec_reg>, <Rt>
```

Decode for this encoding

```
t = UInt(Rt);
if reg != '000x' && reg != '1000' then UNPREDICTABLE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VMSR* on page K1-5357.

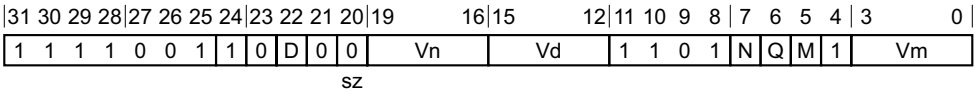
F6.1.126 VMUL (floating-point)

Vector Multiply multiplies corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMUL{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

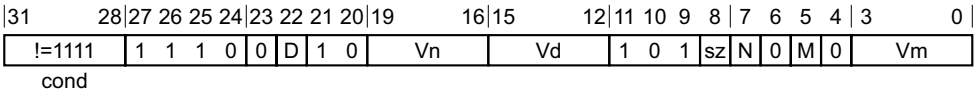
Applies when `Q == 1`.

```
VMUL{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
advsimd = TRUE;  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2



Single-precision scalar variant

Applies when `sz == 0`.

```
VMUL{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `sz == 1`.

```
VMUL{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE;  dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

F6.1.129 VMULL (integer and polynomial)

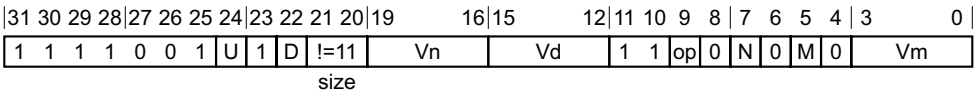
Vector Multiply Long multiplies corresponding elements in two vectors. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}* on page A1-45.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



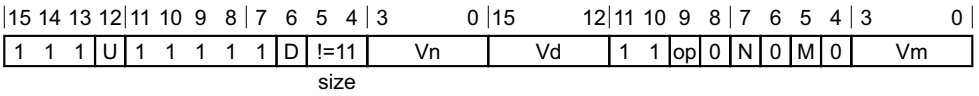
A1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
unsigned = (U == '1'); polynomial = (op == '1'); long_destination = TRUE;
esize = 8 << UInt(size); elements = 64 DIV esize;
if polynomial then
    if U == '1' || size == '01' then UNDEFINED;
    if size == '10' then    // .p64
        if !HaveCryptoExt() then UNDEFINED;
        if InITBlock() then UNPREDICTABLE;
        esize = 64; elements = 1;
if Vd<0> == '1' then UNDEFINED;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = 1;
```

T1



T1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: See *Advanced SIMD data-processing* on page F3-2369 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-2457 for the A32 instruction set.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 Advanced SIMD VMUL or VMULL instruction must be unconditional. ARM strongly recommends that a T32 Advanced SIMD VMUL or VMULL instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the operands, encoded in the "op:U:size" field. It can have the following values:

S8 when op = 0, U = 0, size = 00

S16 when op = 0, U = 0, size = 01

S32 when op = 0, U = 0, size = 10

U8 when op = 0, U = 1, size = 00

U16 when op = 0, U = 1, size = 01

U32 when op = 0, U = 1, size = 10

P8 when op = 1, U = 0, size = 00

P64 when op = 1, U = 0, size = 10

The following encodings are reserved:

- op = 0, U = 0, size = 11.
- op = 0, U = 1, size = 11.
- op = 1, U = 0, size = 01.
- op = 1, U = 0, size = 11.
- op = 1, U = 1, size = xx.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            op2 = Elem[Din[m+r],e,esize];  op2val = Int(op2, unsigned);
            if polynomial then
                product = PolynomialMult(op1,op2);
            else
                product = (op1val*op2val)<2*esize-1:0>;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = product;
            else
                Elem[D[d+r],e,esize] = product<esize-1:0>;

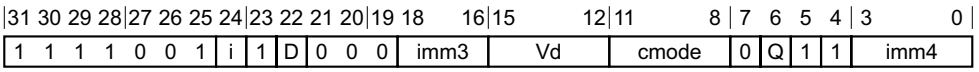
F6.1.131 VMVN (immediate)

Vector Bitwise NOT (immediate) places the bitwise inverse of an immediate integer constant into every element of the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMVN{<c>}{<q>}.<dt> <Dd>, #<imm>
```

128-bit SIMD vector variant

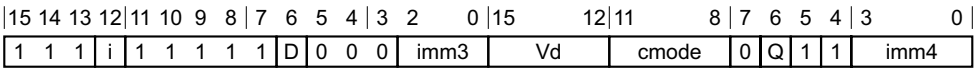
Applies when `Q == 1`.

```
VMVN{<c>}{<q>}.<dt> <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMVN{<c>}{<q>}.<dt> <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

F6.1.134 VNMLA

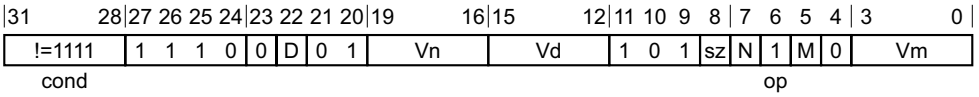
Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

Note

ARM recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

A1



Single-precision scalar variant

Applies when sz == 0.

```
VNMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

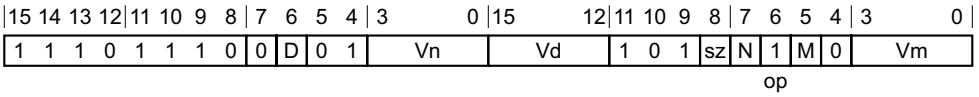
Applies when sz == 1.

```
VNMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
type = if op == '1' then VFPNegMul_VNMLA else VFPNegMul_VNMLS;
dp_operation = (sz == '1');
d = if dp_operation then UInt(D:Vd) else UInt(Vd:D);
n = if dp_operation then UInt(N:Vn) else UInt(Vn:N);
m = if dp_operation then UInt(M:Vm) else UInt(Vm:M);
```

T1



Single-precision scalar variant

Applies when sz == 0.

```
VNMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when sz == 1.

```
VNMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

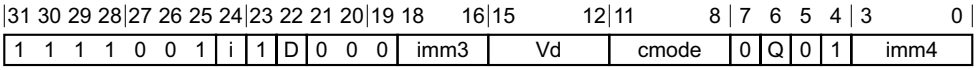
F6.1.137 VORN (immediate)

Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an immediate value, and returns the result into the destination vector

This instruction is an alias of the VORR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (immediate).
- The description of VORR (immediate) gives the operational pseudocode for this instruction.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.<dt> <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

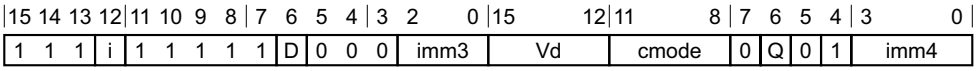
```
VORN{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.<dt> <Qd>, #~<imm>
```

and is never the preferred disassembly.

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.<dt> <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VORN{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
VORR{<c>}{<q>}.<dt> <Qd>, #~<imm>
```

and is never the preferred disassembly.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-2322. An A32 VORR instruction must be unconditional. ARM strongly recommends that a T32 VORR instruction is unconditional, see *Conditional execution* on page F2-2323.
<q>	See *Standard assembler syntax fields* on page F2-2322.
<dt>	The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<imm>	Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2338.

Operation for all encodings

The description of VORR (immediate) gives the operational pseudocode for this instruction.

Non-Confidential - Beta

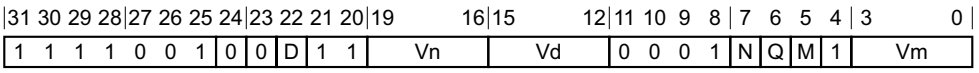
F6.1.138 VORN (register)

Vector bitwise OR NOT (register) performs a bitwise OR NOT operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

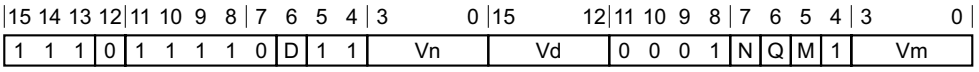
Applies when `Q == 1`.

```
VORN{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VORN{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

F6.1.139 VORR (immediate)

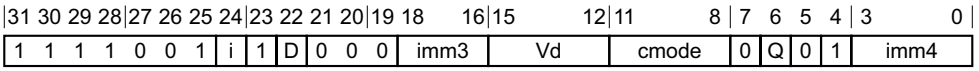
Vector Bitwise OR (immediate) performs a bitwise OR between a register value and an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

This instruction is used by the alias VORN (immediate). See the *Alias conditions* on page F6-3426 table for details of when each alias is preferred.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

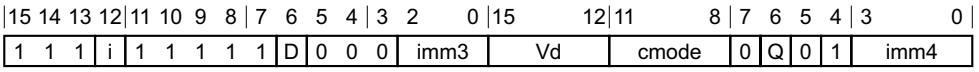
Applies when `Q == 1`.

```
VORR{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE VMOV (immediate);
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VORR{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Copyright © 2013-2016 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE VMOV (immediate);
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-2375 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-2463 for the A32 instruction set.

Alias conditions

Alias	is preferred when
VORN (immediate)	Never

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VORR instruction must be unconditional. ARM strongly recommends that a T32 VORR instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-2338.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] OR imm64;
```

F6.1.140 VORR (register)

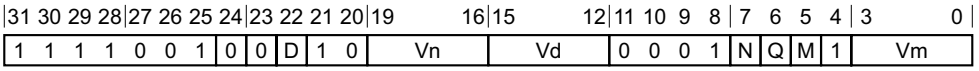
Vector bitwise OR (register) performs a bitwise OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

This instruction is used by the aliases VMOV (register, SIMD), VRSHR (zero), and VSHR (zero). See the *Alias conditions* on page F6-3428 table for details of when each alias is preferred.

A1



64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

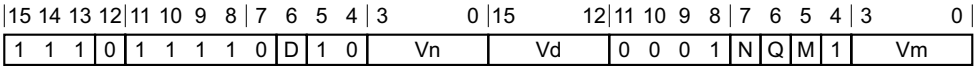
Applies when `Q == 1`.

```
VORR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1



64-bit SIMD vector variant

Applies when `Q == 0`.

Alias conditions

Alias	is preferred when
VMOV (register, SIMD)	N:Vn == M:Vm
VRSHR (zero)	Never
VSHR (zero)	Never

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VORR instruction must be unconditional. ARM strongly recommends that a T32 VORR instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR D[m+r];
```

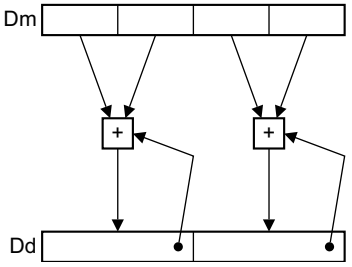
F6.1.141 VPADAL

Vector Pairwise Add and Accumulate Long adds adjacent pairs of elements of a vector, and accumulates the results into the elements of the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows an example of the operation of VPADAL doubleword operation for data type S16.



Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2322. An A32 VPADAL instruction must be unconditional. ARM strongly recommends that a T32 VPADAL instruction is unconditional, see *Conditional execution* on page F2-2323.

<q> See *Standard assembler syntax fields* on page F2-2322.

<dt> Is the data type for the elements of the vectors, encoded in the "op:size" field. It can have the following values:

S8	when op = 0, size = 00
S16	when op = 0, size = 01
S32	when op = 0, size = 10
U8	when op = 1, size = 00
U16	when op = 1, size = 01
U32	when op = 1, size = 10

The following encodings are reserved:

- op = 0, size = 11.
- op = 1, size = 11.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    h = elements DIV 2;

    for r = 0 to regs-1
        for e = 0 to h-1
            op1 = Elem[D[m+r],2*e,esize];  op2 = Elem[D[m+r],2*e+1,esize];
            result = Int(op1, unsigned) + Int(op2, unsigned);
            Elem[D[d+r],e,2*esize] = Elem[D[d+r],e,2*esize] + result;
```

F6.1.142 VPADD (floating-point)

Vector Pairwise Add (floating-point) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements are 32-bit floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.

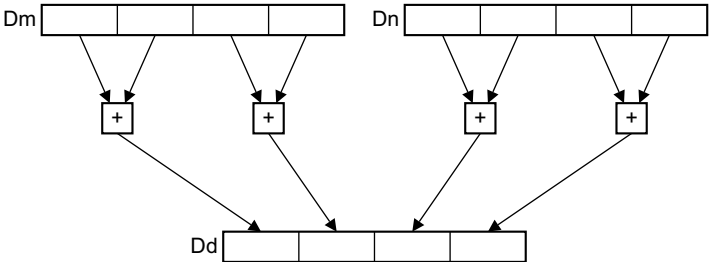
F6.1.143 VPADD (integer)

Vector Pairwise Add (integer) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements must all be the same type, and can be 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The following figure shows an example of the operation of VPADD doubleword operation for data type I16.



Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3737.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2323.
