## 20.16.2 Scoped allocator adaptor member types [allocator.adaptor.types]

typedef *see below* inner\_allocator\_type;

- 1     *Type:* scoped\_allocator\_adaptor<OuterAlloc> if sizeof...(InnerAllocs) is zero; otherwise, scoped\_allocator\_adaptor<InnerAllocs...>.

typedef *see below* propagate\_on\_container\_copy\_assignment;

- 2     *Type:* true\_type if allocator\_traits<A>::propagate\_on\_container\_copy\_assignment::value is true for any A in the set of OuterAlloc and InnerAllocs...; otherwise, false\_type.

typedef *see below* propagate\_on\_container\_move\_assignment;

- 3     *Type:* true\_type if allocator\_traits<A>::propagate\_on\_container\_move\_assignment::value is true for any A in the set of OuterAlloc and InnerAllocs...; otherwise, false\_type.

typedef *see below* propagate\_on\_container\_swap;

- 4     *Type:* true\_type if allocator\_traits<A>::propagate\_on\_container\_swap::value is true for any A in the set of OuterAlloc and InnerAllocs...; otherwise, false\_type.

typedef *see below* is\_always\_equal;

- 5     *Type:* true\_type if allocator\_traits<A>::is\_always\_equal::value is true for every A in the set of OuterAlloc and InnerAllocs...; otherwise, false\_type.

## 20.16.3 Scoped allocator adaptor constructors [allocator.adaptor.cnstr]

scoped\_allocator\_adaptor();

- 1     *Effects:* Value-initializes the OuterAlloc base class and the inner allocator object.

```

template <class OuterA2>
    scoped_allocator_adaptor(OuterA2&& outerAlloc,
                            const InnerAllocs&... innerAllocs) noexcept;

```

- 2     *Requires:* OuterAlloc shall be constructible from OuterA2.

- 3     *Effects:* Initializes the OuterAlloc base class with std::forward<OuterA2>(outerAlloc) and inner with innerAllocs... (hence recursively initializing each allocator within the adaptor with the corresponding allocator from the argument list).

```
scoped_allocator_adaptor(const scoped_allocator_adaptor& other) noexcept;
```

4       *Effects:* Initializes each allocator within the adaptor with the corresponding allocator from **other**.

```
scoped_allocator_adaptor(scoped_allocator_adaptor&& other) noexcept;
```

5       *Effects:* Move constructs each allocator within the adaptor with the corresponding allocator from **other**.

```
template <class OuterA2>
    scoped_allocator_adaptor(const scoped_allocator_adaptor<OuterA2,
                                InnerAllocs...>& other) noexcept;
```

6       *Requires:* OuterAlloc shall be constructible from OuterA2.

7       *Effects:* Initializes each allocator within the adaptor with the corresponding allocator from **other**.

```
template <class OuterA2>
    scoped_allocator_adaptor(scoped_allocator_adaptor<OuterA2,
                                InnerAllocs...>&& other) noexcept;
```

8       *Requires:* OuterAlloc shall be constructible from OuterA2.

9       *Effects:* Initializes each allocator within the adaptor with the corresponding allocator rvalue from **other**.

## 20.16.4 Scoped allocator adaptor members [allocator.adaptor.members]

1 In the **construct** member functions, *OUTERMOST*(*x*) is *x* if *x* does not have an **outer\_allocator**() member function and

*OUTERMOST*(*x*.**outer\_allocator**()) otherwise; *OUTERMOST\_ALLOC\_TRAITS*(*x*) is

**allocator\_traits**<decltype(*OUTERMOST*(*x*))>. [Note: *OUTERMOST*(*x*) and

*OUTERMOST\_ALLOC\_TRAITS*(*x*) are recursive operations. It is incumbent upon the definition of **outer\_allocator**() to ensure that the recursion terminates. It will terminate for all instantiations of **scoped\_allocator\_adaptor**. — end note]

```
inner_allocator_type& inner_allocator() noexcept;
const inner_allocator_type& inner_allocator() const noexcept;
```

2       *Returns:* \*this if sizeof...(InnerAllocs) is zero; otherwise, **inner**.

```
outer_allocator_type& outer_allocator() noexcept;
```

3       *Returns:* **static\_cast**<OuterAlloc&>(\*this).

```
const outer_allocator_type& outer_allocator() const noexcept;
```

4       *Returns:* **static\_cast**<const OuterAlloc&>(\*this).

```
pointer allocate(size_type n);
```

5       *Returns:* **allocator\_traits**<OuterAlloc>::allocate(**outer\_allocator**(), *n*).

```
pointer allocate(size_type n, const_void_pointer hint);
```

6       *Returns:* **allocator\_traits**<OuterAlloc>::allocate(**outer\_allocator**(), *n*, *hint*).

```
void deallocate(pointer p, size_type n) noexcept;
```

7       *Effects:* As if by: **allocator\_traits**<OuterAlloc>::deallocate(**outer\_allocator**(), *p*, *n*);

```
size_type max_size() const;
```

8 *Returns:* `allocator_traits<OuterAlloc>::max_size(outer_allocator())`.

```
template <class T, class... Args>
void construct(T* p, Args&&... args);
```

9 *Effects:*

- (9.1) — If `uses_allocator<T, inner_allocator_type>::value` is false and `is_constructible<T, Args...>::value` is true, calls `OUTERMOST_ALLOC_TRAITS(*this)::construct(OUTERMOST(*this), p, std::forward<Args>(args)...)`.
- (9.2) — Otherwise, if `uses_allocator<T, inner_allocator_type>::value` is true and `is_constructible<T, allocator_arg_t, inner_allocator_type&, Args...>::value` is true, calls `OUTERMOST_ALLOC_TRAITS(*this)::construct(OUTERMOST(*this), p, allocator_arg, inner_allocator(), std::forward<Args>(args)...)`.
- (9.3) — Otherwise, if `uses_allocator<T, inner_allocator_type>::value` is true and `is_constructible<T, Args..., inner_allocator_type&>::value` is true, calls `OUTERMOST_ALLOC_TRAITS(*this)::construct(OUTERMOST(*this), p, std::forward<Args>(args)..., inner_allocator())`.
- (9.4) — Otherwise, the program is ill-formed. [ *Note:* An error will result if `uses_allocator` evaluates to true but the specific constructor does not take an allocator. This definition prevents a silent failure to pass an inner allocator to a contained element. — *end note* ]

```
template <class T1, class T2, class... Args1, class... Args2>
void construct(pair<T1, T2>* p, piecewise_construct_t,
               tuple<Args1...> x, tuple<Args2...> y);
```

10 *Requires:* all of the types in `Args1` and `Args2` shall be `CopyConstructible` (Table 21).

11 *Effects:* Constructs a `tuple` object `xprime` from `x` by the following rules:

- (11.1) — If `uses_allocator<T1, inner_allocator_type>::value` is false and `is_constructible<T1, Args1...>::value` is true, then `xprime` is `x`.
- (11.2) — Otherwise, if `uses_allocator<T1, inner_allocator_type>::value` is true and `is_constructible<T1, allocator_arg_t, inner_allocator_type&, Args1...>::value` is true, then `xprime` is `tuple_cat(tuple<allocator_arg_t, inner_allocator_type&>(allocator_arg, inner_allocator()), std::move(x))`.
- (11.3) — Otherwise, if `uses_allocator<T1, inner_allocator_type>::value` is true and `is_constructible<T1, Args1..., inner_allocator_type&>::value` is true, then `xprime` is `tuple_cat(std::move(x), tuple<inner_allocator_type&>(inner_allocator()))`.
- (11.4) — Otherwise, the program is ill-formed.

and constructs a `tuple` object `yprime` from `y` by the following rules:

- (11.5) — If `uses_allocator<T2, inner_allocator_type>::value` is false and `is_constructible<T2, Args2...>::value` is true, then `yprime` is `y`.
- (11.6) — Otherwise, if `uses_allocator<T2, inner_allocator_type>::value` is true and `is_constructible<T2, allocator_arg_t, inner_allocator_type&, Args2...>::value` is true, then `yprime` is `tuple_cat(tuple<allocator_arg_t, inner_allocator_type&>(allocator_arg, inner_allocator()), std::move(y))`.
- (11.7) — Otherwise, if `uses_allocator<T2, inner_allocator_type>::value` is true and `is_constructible<T2, Args2..., inner_allocator_type&>::value` is true, then `yprime` is `tuple_cat(std::move(y), tuple<inner_allocator_type&>(inner_allocator()))`.

(11.8) — Otherwise, the program is ill-formed.

then calls `OUTERMOST_ALLOC_TRAITS(*this)::construct(OUTERMOST(*this), p, piecewise_construct, std::move(xprime), std::move(yprime))`.

```
template <class T1, class T2>
void construct(pair<T1, T2>* p);
```

12 *Effects:* Equivalent to:

```
    this->construct(p, piecewise_construct, tuple<>(), tuple<>());
```

```
template <class T1, class T2, class U, class V>
void construct(pair<T1, T2>* p, U&& x, V&& y);
```

13 *Effects:* Equivalent to:

```
    this->construct(p, piecewise_construct,
                   forward_as_tuple(std::forward<U>(x)),
                   forward_as_tuple(std::forward<V>(y)));
```

```
template <class T1, class T2, class U, class V>
void construct(pair<T1, T2>* p, const pair<U, V>&& x);
```

14 *Effects:* Equivalent to:

```
    this->construct(p, piecewise_construct,
                   forward_as_tuple(x.first),
                   forward_as_tuple(x.second));
```

```
template <class T1, class T2, class U, class V>
void construct(pair<T1, T2>* p, pair<U, V>&& x);
```

15 *Effects:* Equivalent to:

```
    this->construct(p, piecewise_construct,
                   forward_as_tuple(std::forward<U>(x.first)),
                   forward_as_tuple(std::forward<V>(x.second)));
```

```
template <class T>
void destroy(T* p);
```

16 *Effects:* Calls `OUTERMOST_ALLOC_TRAITS(*this)::destroy(OUTERMOST(*this), p)`.

```
scoped_allocator_adaptor select_on_container_copy_construction() const;
```

17 *Returns:* A new `scoped_allocator_adaptor` object where each allocator `A` in the adaptor is initialized from the result of calling `allocator_traits<A>::select_on_container_copy_construction()` on the corresponding allocator in `*this`.

## 20.16.5 Scoped allocator operators

[scoped.adaptor.operators]

```
template <class OuterA1, class OuterA2, class... InnerAllocs>
bool operator==(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
```

1 *Returns:* `a.outer_allocator() == b.outer_allocator()` if `sizeof...(InnerAllocs)` is zero; otherwise, `a.outer_allocator() == b.outer_allocator() && a.inner_allocator() == b.inner_allocator()`.

```
template <class OuterA1, class OuterA2, class... InnerAllocs>
bool operator!=(const scoped_allocator_adaptor<OuterA1, InnerAllocs...>& a,
                const scoped_allocator_adaptor<OuterA2, InnerAllocs...>& b) noexcept;
```

2 *Returns:* `!(a == b)`.

**20.17 Class `type_index`****[type.index]****20.17.1 Header `<typeindex>` synopsis****[type.index.synopsis]**

```
namespace std {
    class type_index;
    template <class T> struct hash;
    template<> struct hash<type_index>;
}
```

**20.17.2 `type_index` overview****[type.index.overview]**

```
namespace std {
    class type_index {
    public:
        type_index(const type_info& rhs) noexcept;
        bool operator==(const type_index& rhs) const noexcept;
        bool operator!=(const type_index& rhs) const noexcept;
        bool operator<(const type_index& rhs) const noexcept;
        bool operator<= (const type_index& rhs) const noexcept;
        bool operator> (const type_index& rhs) const noexcept;
        bool operator>= (const type_index& rhs) const noexcept;
        size_t hash_code() const noexcept;
        const char* name() const noexcept;
    private:
        const type_info* target;    // exposition only
        // Note that the use of a pointer here, rather than a reference,
        // means that the default copy/move constructor and assignment
        // operators will be provided and work as expected.
    };
}
```

- <sup>1</sup> The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (23.4) and in unordered associative containers (23.5).

**20.17.3 `type_index` members****[type.index.members]**

```
type_index(const type_info& rhs) noexcept;
```

- <sup>1</sup> *Effects:* Constructs a `type_index` object, the equivalent of `target = &rhs`.

```
bool operator==(const type_index& rhs) const noexcept;
```

- <sup>2</sup> *Returns:* `*target == *rhs.target`

```
bool operator!=(const type_index& rhs) const noexcept;
```

- <sup>3</sup> *Returns:* `*target != *rhs.target`

```
bool operator<(const type_index& rhs) const noexcept;
```

- <sup>4</sup> *Returns:* `target->before(*rhs.target)`

```
bool operator<=(const type_index& rhs) const noexcept;
```

- <sup>5</sup> *Returns:* `!rhs.target->before(*target)`

```
bool operator>(const type_index& rhs) const noexcept;
```

- <sup>6</sup> *Returns:* `rhs.target->before(*target)`

```
bool operator>=(const type_index& rhs) const noexcept;
```

7       *Returns:* !target->before(\*rhs.target)

```
size_t hash_code() const noexcept;
```

8       *Returns:* target->hash\_code()

```
const char* name() const noexcept;
```

9       *Returns:* target->name()

## 20.17.4 Hash support

[type.index.hash]

```
template <> struct hash<type_index>;
```

1       The template specialization shall meet the requirements of class template `hash` (20.12.14). For an object `index` of type `type_index`, `hash<type_index>()(index)` shall evaluate to the same result as `index.hash_code()`.

## 20.18 Execution policies

[execpol]

### 20.18.1 In general

[execpol.general]

1 This subclause describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions. [Example:

```
using namespace std;
vector<int> v = ...

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(sequential, v.begin(), v.end());

// permitting parallel execution
sort(par, v.begin(), v.end());

// permitting vectorization as well
sort(par_vec, v.begin(), v.end());
```

— end example] [Note: Because different parallel architectures may require idiosyncratic parameters for efficient execution, implementations may provide additional execution policies to those described in this standard as extensions. — end note]

### 20.18.2 Header `<execution_policy>` synopsis

[execpol.syn]

```
namespace std {
    // 20.18.3, execution policy type trait:
    template<class T> struct is_execution_policy;
    template<class T> constexpr bool is_execution_policy_v = is_execution_policy<T>::value;

    // 20.18.4, sequential execution policy:
    class sequential_execution_policy;

    // 20.18.5, parallel execution policy:
    class parallel_execution_policy;
```

```

// 20.18.6, parallel+vector execution policy:
class parallel_vector_execution_policy;

// 20.18.7, execution policy objects:
constexpr sequential_execution_policy      sequential{ unspecified };
constexpr parallel_execution_policy        par{ unspecified };
constexpr parallel_vector_execution_policy par_vec{ unspecified };
}

```

### 20.18.3 Execution policy type trait [execpol.type]

```
template<class T> struct is_execution_policy { see below };
```

- 1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
- 2 `is_execution_policy<T>` shall be a `UnaryTypeTrait` with a `BaseCharacteristic` of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.  
[ *Note*: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — *end note*]
- 3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

### 20.18.4 Sequential execution policy [execpol.seq]

```
class sequential_execution_policy { unspecified };
```

- 1 The class `sequential_execution_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

### 20.18.5 Parallel execution policy [execpol.par]

```
class parallel_execution_policy { unspecified };
```

- 1 The class `parallel_execution_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

### 20.18.6 Parallel+Vector execution policy [execpol.vec]

```
class parallel_vector_execution_policy { unspecified };
```

- 1 The class `parallel_vector_execution_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

### 20.18.7 Execution policy objects [parallel.execpol.objects]

```

constexpr sequential_execution_policy      sequential{ unspecified };
constexpr parallel_execution_policy        par{ unspecified };
constexpr parallel_vector_execution_policy par_vec{ unspecified };

```

- 1 The header `<execution_policy>` declares global objects associated with each type of execution policy.

## 21 Strings library

[strings]

### 21.1 General

[strings.general]

- <sup>1</sup> This Clause describes components for manipulating sequences of any non-array POD (3.9) type. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.
- <sup>2</sup> The following subclauses describe a character traits class, a string class, and null-terminated sequence utilities, as summarized in Table 64.

Table 64 — Strings library summary

| Subclause                               | Header(s)     |
|-----------------------------------------|---------------|
| 21.2 Character traits                   | <string>      |
| 21.3 String classes                     | <string>      |
| 21.4 String view classes                | <string_view> |
| 21.5 Null-terminated sequence utilities | <cctype>      |
|                                         | <cwctype>     |
|                                         | <cstring>     |
|                                         | <wchar>       |
|                                         | <cstdlib>     |
|                                         | <cuchar>      |

### 21.2 Character traits

[char.traits]

- <sup>1</sup> This subclause defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with four specializations, `char_traits<char>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that satisfy those requirements.
- <sup>2</sup> Most classes specified in Clauses 21.3 and 27 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedefs and functions in the template parameter ‘traits’ used by each such template. This subclause defines the semantics of these members.
- <sup>3</sup> To specialize those templates to generate a string or istream class to handle a particular character container type `CharT`, that and its related character traits class `Traits` are passed as a pair of parameters to the string or istream template as parameters `charT` and `traits`. `Traits::char_type` shall be the same as `CharT`.
- <sup>4</sup> This subclause specifies a class template, `char_traits<charT>`, and four explicit specializations of it, `char_traits<char>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, all of which appear in the header `<string>` and satisfy the requirements below.

#### 21.2.1 Character traits requirements

[char.traits.require]

- <sup>1</sup> In Table 65, `X` denotes a Traits class defining types and functions for the character container type `CharT`; `c` and `d` denote values of type `CharT`; `p` and `q` denote values of type `const CharT*`; `s` denotes a value of type `CharT*`; `n`, `i` and `j` denote values of type `std::size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; `state` denotes a value of type `X::state_type`; and `r` denotes an lvalue of type `CharT`. Operations on Traits shall not throw exceptions.

Table 65 — Character traits requirements

| Expression                      | Return type                      | Assertion/note<br>pre-/post-condition                                                                                                                                                                                                                                                                                                | Complexity   |
|---------------------------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| <code>X::char_type</code>       | <code>charT</code>               | (described in 21.2.2)                                                                                                                                                                                                                                                                                                                | compile-time |
| <code>X::int_type</code>        |                                  | (described in 21.2.2)                                                                                                                                                                                                                                                                                                                | compile-time |
| <code>X::off_type</code>        |                                  | (described in 21.2.2)                                                                                                                                                                                                                                                                                                                | compile-time |
| <code>X::pos_type</code>        |                                  | (described in 21.2.2)                                                                                                                                                                                                                                                                                                                | compile-time |
| <code>X::state_type</code>      |                                  | (described in 21.2.2)                                                                                                                                                                                                                                                                                                                | compile-time |
| <code>X::eq(c,d)</code>         | <code>bool</code>                | yields: whether <code>c</code> is to be treated as equal to <code>d</code> .                                                                                                                                                                                                                                                         | constant     |
| <code>X::lt(c,d)</code>         | <code>bool</code>                | yields: whether <code>c</code> is to be treated as less than <code>d</code> .                                                                                                                                                                                                                                                        | constant     |
| <code>X::compare(p,q,n)</code>  | <code>int</code>                 | yields: 0 if for each <code>i</code> in <code>[0,n)</code> , <code>X::eq(p[i],q[i])</code> is true; else, a negative value if, for some <code>j</code> in <code>[0,n)</code> , <code>X::lt(p[j],q[j])</code> is true and for each <code>i</code> in <code>[0,j)</code> <code>X::eq(p[i],q[i])</code> is true; else a positive value. | linear       |
| <code>X::length(p)</code>       | <code>std::size_t</code>         | yields: the smallest <code>i</code> such that <code>X::eq(p[i],charT())</code> is true.                                                                                                                                                                                                                                              | linear       |
| <code>X::find(p,n,c)</code>     | <code>const X::char_type*</code> | yields: the smallest <code>q</code> in <code>[p,p+n)</code> such that <code>X::eq(*q,c)</code> is true, zero otherwise.                                                                                                                                                                                                              | linear       |
| <code>X::move(s,p,n)</code>     | <code>X::char_type*</code>       | for each <code>i</code> in <code>[0,n)</code> , performs <code>X::assign(s[i],p[i])</code> . Copies correctly even where the ranges <code>[p,p+n)</code> and <code>[s,s+n)</code> overlap. yields: <code>s</code> .                                                                                                                  | linear       |
| <code>X::copy(s,p,n)</code>     | <code>X::char_type*</code>       | pre: <code>p</code> not in <code>[s,s+n)</code> . yields: <code>s</code> . for each <code>i</code> in <code>[0,n)</code> , performs <code>X::assign(s[i],p[i])</code> .                                                                                                                                                              | linear       |
| <code>X::assign(r,d)</code>     | (not used)                       | assigns <code>r=d</code> .                                                                                                                                                                                                                                                                                                           | constant     |
| <code>X::assign(s,n,c)</code>   | <code>X::char_type*</code>       | for each <code>i</code> in <code>[0,n)</code> , performs <code>X::assign(s[i],c)</code> . yields: <code>s</code> .                                                                                                                                                                                                                   | linear       |
| <code>X::not_eof(e)</code>      | <code>int_type</code>            | yields: <code>e</code> if <code>X::eq_int_type(e,X::eof())</code> is false, otherwise a value <code>f</code> such that <code>X::eq_int_type(f,X::eof())</code> is false.                                                                                                                                                             | constant     |
| <code>X::to_char_type(e)</code> | <code>X::char_type</code>        | yields: if for some <code>c</code> , <code>X::eq_int_type(e,X::to_int_type(c))</code> is true, <code>c</code> ; else some unspecified value.                                                                                                                                                                                         | constant     |
| <code>X::to_int_type(c)</code>  | <code>X::int_type</code>         | yields: some value <code>e</code> , constrained by the definitions of <code>to_char_type</code> and <code>eq_int_type</code> .                                                                                                                                                                                                       | constant     |

Table 65 — Character traits requirements (continued)

| Expression                       | Return type              | Assertion/note<br>pre-/post-condition                                                                                                                                                                                                                                                                                                                                                                                                        | Complexity |
|----------------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| <code>X::eq_int_type(e,f)</code> | <code>bool</code>        | yields: for all <code>c</code> and <code>d</code> ,<br><code>X::eq(c,d)</code> is equal to <code>X::eq_int_type(X::to_int_type(c), X::to_int_type(d))</code> ;<br>otherwise, yields true if <code>e</code> and <code>f</code> are both copies of <code>X::eof()</code> ;<br>otherwise, yields false if one of <code>e</code> and <code>f</code> is a copy of <code>X::eof()</code> and the other is not; otherwise the value is unspecified. | constant   |
| <code>X::eof()</code>            | <code>X::int_type</code> | yields: a value <code>e</code> such that<br><code>X::eq_int_type(e,X::to_int_type(c))</code> is false for all values <code>c</code> .                                                                                                                                                                                                                                                                                                        | constant   |

<sup>2</sup> The class template

```
template<class charT> struct char_traits;
```

shall be provided in the header `<string>` as a basis for explicit specializations.

### 21.2.2 traits typedefs

[`char.traits.typedefs`]

```
typedef CHAR_T char_type;
```

<sup>1</sup> The type `char_type` is used to refer to the character container type in the implementation of the library classes defined in 21.3 and Clause 27.

```
typedef INT_T int_type;
```

<sup>2</sup> *Requires:* For a certain character container type `char_type`, a related container type `INT_T` shall be a type or class which can represent all of the valid characters converted from the corresponding `char_type` values, as well as an end-of-file value, `eof()`. The type `int_type` represents a character container type which can hold end-of-file to be used as a return type of the `iostream` class member functions.<sup>230</sup>

```
typedef implementation-defined off_type;
```

```
typedef implementation-defined pos_type;
```

<sup>3</sup> *Requires:* Requirements for `off_type` and `pos_type` are described in 27.2.2 and 27.3.

```
typedef STATE_T state_type;
```

<sup>4</sup> *Requires:* `state_type` shall meet the requirements of `CopyAssignable` (Table 23), `CopyConstructible` (Table 21), and `DefaultConstructible` (Table 19) types.

<sup>230</sup>) If `eof()` can be held in `char_type` then some `iostreams` operations may give surprising results.

**21.2.3 char\_traits specializations****[char.traits.specializations]**

```

namespace std {
    template<> struct char_traits<char>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;
}

```

- <sup>1</sup> The header <string> shall define four specializations of the class template char\_traits: char\_traits<char>, char\_traits<char16\_t>, char\_traits<char32\_t>, and char\_traits<wchar\_t>.
- <sup>2</sup> The requirements for the members of these specializations are given in Clause 21.2.1.

**21.2.3.1 struct char\_traits<char>****[char.traits.specializations.char]**

```

namespace std {
    template<> struct char_traits<char> {
        typedef char          char_type;
        typedef int           int_type;
        typedef streamoff     off_type;
        typedef streampos     pos_type;
        typedef mbstate_t     state_type;

        static void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static int compare(const char_type* s1, const char_type* s2, size_t n);
        static size_t length(const char_type* s);
        static const char_type* find(const char_type* s, size_t n,
                                    const char_type& a);
        static char_type* move(char_type* s1, const char_type* s2, size_t n);
        static char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static char_type* assign(char_type* s, size_t n, char_type a);

        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

```

- <sup>1</sup> The defined types for int\_type, pos\_type, off\_type, and state\_type shall be int, streampos, streamoff, and mbstate\_t respectively.
- <sup>2</sup> The type streampos shall be an implementation-defined type that satisfies the requirements for pos\_type in 27.2.2 and 27.3.
- <sup>3</sup> The type streamoff shall be an implementation-defined type that satisfies the requirements for off\_type in 27.2.2 and 27.3.
- <sup>4</sup> The type mbstate\_t is defined in <cwchar> and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.
- <sup>5</sup> The two-argument member assign shall be defined identically to the built-in operator =. The two-argument members eq and lt shall be defined identically to the built-in operators == and < for type unsigned char.

- <sup>6</sup> The member `eof()` shall return EOF.

### 21.2.3.2 struct `char_traits<char16_t>`

[`char.traits.specializations.char16_t`]

```
namespace std {
    template<> struct char_traits<char16_t> {
        typedef char16_t      char_type;
        typedef uint_least16_t int_type;
        typedef streamoff     off_type;
        typedef u16streampos  pos_type;
        typedef mbstate_t     state_type;

        static void assign(char_type& c1, const char_type& c2) noexcept;

    };
}
```

- <sup>1</sup> The type `u16streampos` shall be an implementation-defined type that satisfies the requirements for `pos_type` in 27.2.2 and 27.3.
- <sup>2</sup> The two-argument members `assign`, `eq`, and `lt` shall be defined identically to the built-in operators `=`, `==`, and `<` respectively.
- <sup>3</sup> The member `eof()` shall return an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

### 21.2.3.3 struct `char_traits<char32_t>`

[`char.traits.specializations.char32_t`]

```
namespace std {
    template<> struct char_traits<char32_t> {
        typedef char32_t      char_type;
        typedef uint_least32_t int_type;
        typedef streamoff     off_type;
        typedef u32streampos  pos_type;
        typedef mbstate_t     state_type;

        static void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;

        static int compare(const char_type* s1, const char_type* s2, size_t n);
        static size_t length(const char_type* s);
        static const char_type* find(const char_type* s, size_t n,
```

```

        const char_type& a);
static char_type* move(char_type* s1, const char_type* s2, size_t n);
static char_type* copy(char_type* s1, const char_type* s2, size_t n);
static char_type* assign(char_type* s, size_t n, char_type a);

static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};
}

```

- <sup>1</sup> The type `u32streampos` shall be an implementation-defined type that satisfies the requirements for `pos_type` in 27.2.2 and 27.3.
- <sup>2</sup> The two-argument members `assign`, `eq`, and `lt` shall be defined identically to the built-in operators `=`, `==`, and `<` respectively.
- <sup>3</sup> The member `eof()` shall return an implementation-defined constant that cannot appear as a Unicode code point.

#### 21.2.3.4 struct `char_traits<wchar_t>`

[char.traits.specializations.wchar.t]

```

namespace std {
template<> struct char_traits<wchar_t> {
    typedef wchar_t      char_type;
    typedef wint_t       int_type;
    typedef streamoff     off_type;
    typedef wstreampos    pos_type;
    typedef mbstate_t     state_type;

    static void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static int compare(const char_type* s1, const char_type* s2, size_t n);
    static size_t length(const char_type* s);
    static const char_type* find(const char_type* s, size_t n,
        const char_type& a);
    static char_type* move(char_type* s1, const char_type* s2, size_t n);
    static char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
};
}

```

- <sup>1</sup> The defined types for `int_type`, `pos_type`, and `state_type` shall be `wint_t`, `wstreampos`, and `mbstate_t` respectively.
- <sup>2</sup> The type `wstreampos` shall be an implementation-defined type that satisfies the requirements for `pos_type` in 27.2.2 and 27.3.

- <sup>3</sup> The type `mbstate_t` is defined in `<wchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.
- <sup>4</sup> The two-argument members `assign`, `eq`, and `lt` shall be defined identically to the built-in operators `=`, `==`, and `<` respectively.
- <sup>5</sup> The member `eof()` shall return `WEOF`.

### 21.3 String classes

[string.classes]

- <sup>1</sup> The header `<string>` defines the `basic_string` class template for manipulating varying-length sequences of char-like objects and four typedefs, `string`, `u16string`, `u32string`, and `wstring`, that name the specializations `basic_string<char>`, `basic_string<char16_t>`, `basic_string<char32_t>`, and `basic_string<wchar_t>`, respectively.

#### Header `<string>` synopsis

```
#include <initializer_list>

namespace std {

    // 21.2, character traits:
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;

    // 21.3.1, basic_string:

### 21.3.1 Class template `basic_string`

[basic.string]

- <sup>1</sup> The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of this Clause, the type of the char-like objects held in a `basic_string` object is designated by `charT`.
- <sup>2</sup> The member functions of `basic_string` use an object of the `Allocator` class passed as a template parameter to allocate and free storage for the contained char-like objects.<sup>231</sup>
- <sup>3</sup> A `basic_string` is a contiguous container (23.2.1).
- <sup>4</sup> In all cases, `size() <= capacity()`.
- <sup>5</sup> The functions described in this Clause can report two kinds of errors, each associated with an exception type:
  - (5.1) — a *length* error is associated with exceptions of type `length_error` (19.2.5);
  - (5.2) — an *out-of-range* error is associated with exceptions of type `out_of_range` (19.2.6).

```

namespace std {
template<class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT> >
class basic_string {
public:
    // types:
    typedef traits traits_type;
    typedef typename traits::char_type value_type;
    typedef Allocator allocator_type;
    typedef typename allocator_traits<Allocator>::size_type size_type;
    typedef typename allocator_traits<Allocator>::difference_type difference_type;

    typedef value_type& reference;
    typedef const value_type& const_reference;
    typedef typename allocator_traits<Allocator>::pointer pointer;
    typedef typename allocator_traits<Allocator>::const_pointer const_pointer;

```

<sup>231</sup>) `Allocator::value_type` must name the same type as `charT` (21.3.1.1).

```

```

### 21.3.1.1 `basic_string` general requirements

[string.require]

- <sup>1</sup> If any operation would cause `size()` to exceed `max_size()`, that operation shall throw an exception object of type `length_error`.
- <sup>2</sup> If any member function or operator of `basic_string` throws an exception, that function or operator shall have no other effect.
- <sup>3</sup> In every specialization `basic_string<charT, traits, Allocator>`, the type `allocator_traits<Allocator>::value_type` shall name the same type as `charT`. Every object of type `basic_string<charT, traits, Allocator>` shall use an object of type `Allocator` to allocate and free storage for the contained `charT` objects as needed. The `Allocator` object used shall be obtained as described in 23.2.1.
- <sup>4</sup> References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated

by the following uses of that `basic_string` object:

- (4.1) — as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.<sup>232</sup>
- (4.2) — Calling non-const member functions, except `operator[]`, `at`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

### 21.3.1.2 `basic_string` constructors and assignment operators

[string.cons]

```
explicit basic_string(const Allocator& a) noexcept;
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_string`. The postconditions of this function are indicated in Table 66.

Table 66 — `basic_string(const Allocator&)` effects

| Element                 | Value                                                          |
|-------------------------|----------------------------------------------------------------|
| <code>data()</code>     | a non-null pointer that is copyable and can have 0 added to it |
| <code>size()</code>     | 0                                                              |
| <code>capacity()</code> | an unspecified value                                           |

```
basic_string(const basic_string& str);
basic_string(basic_string&& str) noexcept;
```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_string` as indicated in Table 67. In the second form, `str` is left in a valid state with an unspecified value.

Table 67 — `basic_string(const basic_string&)` effects

| Element                 | Value                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>     | points at the first element of an allocated copy of the array whose first element is pointed at by <code>str.data()</code> |
| <code>size()</code>     | <code>str.size()</code>                                                                                                    |
| <code>capacity()</code> | a value at least as large as <code>size()</code>                                                                           |

```
basic_string(const basic_string& str, size_type pos,
             const Allocator& a = Allocator());
```

- <sup>3</sup> *Throws:* `out_of_range` if `pos > str.size()`.
- <sup>4</sup> *Effects:* Constructs an object of class `basic_string` and determines the effective length `rlen` of the initial string value as `str.size() - pos`, as indicated in Table 68.

```
basic_string(const basic_string& str, size_type pos, size_type n,
             const Allocator& a = Allocator());
```

- <sup>5</sup> *Throws:* `out_of_range` if `pos > str.size()`.
- <sup>6</sup> *Effects:* Constructs an object of class `basic_string` and determines the effective length `rlen` of the initial string value as the smaller of `n` and `str.size() - pos`, as indicated in Table 68.

<sup>232</sup>) For example, as an argument to non-member functions `swap()` (21.3.2.8), `operator>>()` (21.3.2.9), and `getline()` (21.3.2.9), or as an argument to `basic_string::swap()`

Table 68 — `basic_string(const basic_string&, size_type, const Allocator&)`  
and `basic_string(const basic_string&, size_type, size_type, const Allocator&)` effects

| Element                 | Value                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>     | points at the first element of an allocated copy of <code>rlen</code> consecutive elements of the string controlled by <code>str</code> beginning at position <code>pos</code> |
| <code>size()</code>     | <code>rlen</code>                                                                                                                                                              |
| <code>capacity()</code> | a value at least as large as <code>size()</code>                                                                                                                               |

```
basic_string(const charT* s, size_type n,
            const Allocator& a = Allocator());
```

- 7 *Requires:* `s` points to an array of at least `n` elements of `charT`.
- 8 *Effects:* Constructs an object of class `basic_string` and determines its initial string value from the array of `charT` of length `n` whose first element is designated by `s`, as indicated in Table 69.

Table 69 — `basic_string(const charT*, size_type, const Allocator&)` effects

| Element                 | Value                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>     | points at the first element of an allocated copy of the array whose first element is pointed at by <code>s</code> |
| <code>size()</code>     | <code>n</code>                                                                                                    |
| <code>capacity()</code> | a value at least as large as <code>size()</code>                                                                  |

```
basic_string(const charT* s, const Allocator& a = Allocator());
```

- 9 *Requires:* `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.
- 10 *Effects:* Constructs an object of class `basic_string` and determines its initial string value from the array of `charT` of length `traits::length(s)` whose first element is designated by `s`, as indicated in Table 70.

Table 70 — `basic_string(const charT*, const Allocator&)` effects

| Element                 | Value                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>     | points at the first element of an allocated copy of the array whose first element is pointed at by <code>s</code> |
| <code>size()</code>     | <code>traits::length(s)</code>                                                                                    |
| <code>capacity()</code> | a value at least as large as <code>size()</code>                                                                  |

- 11 *Remarks:* Uses `traits::length()`.

```
basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

- 12 *Requires:* `n < npos`.
- 13 *Effects:* Constructs an object of class `basic_string` and determines its initial string value by repeating the char-like object `c` for all `n` elements, as indicated in Table 71.

```
template<class InputIterator>
    basic_string(InputIterator begin, InputIterator end,
                const Allocator& a = Allocator());
```

Table 71 — `basic_string(size_t, charT, const Allocator&)` effects

| Element                 | Value                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>     | points at the first element of an allocated array of <code>n</code> elements, each storing the initial value <code>c</code> |
| <code>size()</code>     | <code>n</code>                                                                                                              |
| <code>capacity()</code> | a value at least as large as <code>size()</code>                                                                            |

14 *Effects:* If `InputIterator` is an integral type, equivalent to:

```
basic_string(static_cast<size_type>(begin), static_cast<value_type>(end), a);
```

Otherwise constructs a string from the values in the range `[begin, end)`, as indicated in the Sequence Requirements table (see 23.2.3).

```
basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
```

15 *Effects:* Same as `basic_string(il.begin(), il.end(), a)`.

```
basic_string(const basic_string& str, const Allocator& alloc);
```

```
basic_string(basic_string&& str, const Allocator& alloc);
```

16 *Effects:* Constructs an object of class `basic_string` as indicated in Table 72. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid state with an unspecified value.

Table 72 — `basic_string(const basic_string&, const Allocator&)` and `basic_string(basic_string&&, const Allocator&)` effects

| Element                      | Value                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>          | points at the first element of an allocated copy of the array whose first element is pointed at by the original value of <code>str.data()</code> . |
| <code>size()</code>          | the original value of <code>str.size()</code>                                                                                                      |
| <code>capacity()</code>      | a value at least as large as <code>size()</code>                                                                                                   |
| <code>get_allocator()</code> | <code>alloc</code>                                                                                                                                 |

17 *Throws:* The second form throws nothing if `alloc == str.get_allocator()`.

```
basic_string& operator=(const basic_string& str);
```

18 *Effects:* If `*this` and `str` are not the same object, modifies `*this` as shown in Table 73.

19 If `*this` and `str` are the same object, the member has no effect.

20 *Returns:* `*this`

Table 73 — `operator=(const basic_string&)` effects

| Element                 | Value                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>data()</code>     | points at the first element of an allocated copy of the array whose first element is pointed at by <code>str.data()</code> |
| <code>size()</code>     | <code>str.size()</code>                                                                                                    |
| <code>capacity()</code> | a value at least as large as <code>size()</code>                                                                           |

```
basic_string& operator=(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
        allocator_traits<Allocator>::is_always_equal::value);
```

21 *Effects:* Move assigns as a sequence container (23.2), except that iterators, pointers and references may be invalidated.

22 *Returns:* *\*this*

```
basic_string& operator=(const charT* s);
```

23 *Returns:* *\*this* = `basic_string(s)`.

24 *Remarks:* Uses `traits::length()`.

```
basic_string& operator=(charT c);
```

25 *Returns:* *\*this* = `basic_string(1,c)`.

```
basic_string& operator=(initializer_list<charT> il);
```

26 *Effects:* As if by: *\*this* = `basic_string(il)`;

27 *Returns:* *\*this*.

### 21.3.1.3 `basic_string` iterator support

[string.iterators]

```
iterator      begin() noexcept;
const_iterator begin() const noexcept;
const_iterator cbegin() const noexcept;
```

1 *Returns:* An iterator referring to the first character in the string.

```
iterator      end() noexcept;
const_iterator end() const noexcept;
const_iterator cend() const noexcept;
```

2 *Returns:* An iterator which is the past-the-end value.

```
reverse_iterator      rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator crbegin() const noexcept;
```

3 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(end())`.

```
reverse_iterator      rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crend() const noexcept;
```

4 *Returns:* An iterator which is semantically equivalent to `reverse_iterator(begin())`.

### 21.3.1.4 `basic_string` capacity

[string.capacity]

```
size_type size() const noexcept;
```

1 *Returns:* A count of the number of char-like objects currently in the string.

2 *Complexity:* Constant time.

```
size_type length() const noexcept;
```

3 *Returns:* `size()`.

```
size_type max_size() const noexcept;
```

4       *Returns:* The size of the largest possible string.

5       *Complexity:* Constant time.

```
void resize(size_type n, charT c);
```

6       *Throws:* `length_error` if `n > max_size()`.

7       *Effects:* Alters the length of the string designated by `*this` as follows:

(7.1)     — If `n <= size()`, the function replaces the string designated by `*this` with a string of length `n` whose elements are a copy of the initial elements of the original string designated by `*this`.

(7.2)     — If `n > size()`, the function replaces the string designated by `*this` with a string of length `n` whose first `size()` elements are a copy of the original string designated by `*this`, and whose remaining elements are all initialized to `c`.

```
void resize(size_type n);
```

8       *Effects:* As if by `resize(n, charT())`.

```
size_type capacity() const noexcept;
```

9       *Returns:* The size of the allocated storage in the string.

```
void reserve(size_type res_arg=0);
```

10       The member function `reserve()` is a directive that informs a `basic_string` object of a planned change in size, so that it can manage the storage allocation accordingly.

11       *Effects:* After `reserve()`, `capacity()` is greater or equal to the argument of `reserve`. [ *Note:* Calling `reserve()` with a `res_arg` argument less than `capacity()` is in effect a non-binding shrink request. A call with `res_arg <= size()` is in effect a non-binding shrink-to-fit request. — *end note* ]

12       *Throws:* `length_error` if `res_arg > max_size()`.<sup>233</sup>

```
void shrink_to_fit();
```

13       *Remarks:* `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`. [ *Note:* The request is non-binding to allow latitude for implementation-specific optimizations. — *end note* ]

```
void clear() noexcept;
```

14       *Effects:* Behaves as if the function calls:

```
erase(begin(), end());
```

```
bool empty() const noexcept;
```

15       *Returns:* `size() == 0`.

---

233) `reserve()` uses `allocator_traits<Allocator>::allocate()` which may throw an appropriate exception.

**21.3.1.5 basic\_string element access****[string.access]**

```
const_reference operator[](size_type pos) const;
reference operator[](size_type pos);
```

1     *Requires:* pos <= size().

2     *Returns:* \*(begin() + pos) if pos < size(). Otherwise, returns a reference to an object of type charT with value charT(), where modifying the object leads to undefined behavior.

3     *Throws:* Nothing.

4     *Complexity:* Constant time.

```
const_reference at(size_type pos) const;
reference at(size_type pos);
```

5     *Throws:* out\_of\_range if pos >= size().

6     *Returns:* operator[](pos).

```
const charT& front() const;
charT& front();
```

7     *Requires:* !empty().

8     *Effects:* Equivalent to operator[](0).

```
const charT& back() const;
charT& back();
```

9     *Requires:* !empty().

10    *Effects:* Equivalent to operator[](size() - 1).

**21.3.1.6 basic\_string modifiers****[string.modifiers]****21.3.1.6.1 basic\_string::operator+=****[string::op+=]**

```
basic_string&
operator+=(const basic_string& str);
```

1     *Effects:* Calls append(str).

2     *Returns:* \*this.

```
basic_string& operator+=(const charT* s);
```

3     *Effects:* Calls append(s).

4     *Returns:* \*this.

```
basic_string& operator+=(charT c);
```

5     *Effects:* Calls push\_back(c);

6     *Returns:* \*this.

```
basic_string& operator+=(initializer_list<charT> il);
```

7     *Effects:* Calls append(il).

8     *Returns:* \*this.

**21.3.1.6.2 basic\_string::append****[string::append]****basic\_string&****append(const basic\_string& str);**1     *Effects:* Calls `append(str.data(), str.size())`.2     *Returns:* `*this`.**basic\_string&****append(const basic\_string& str, size\_type pos, size\_type n = npos);**3     *Throws:* `out_of_range` if `pos > str.size()`.4     *Effects:* Determines the effective length `rlen` of the string to append as the smaller of `n` and `str.size() - pos` and calls `append(str.data() + pos, rlen)`.5     *Returns:* `*this`.**basic\_string&****append(const charT\* s, size\_type n);**6     *Requires:* `s` points to an array of at least `n` elements of `charT`.7     *Throws:* `length_error` if `size() + n > max_size()`.8     *Effects:* The function replaces the string controlled by `*this` with a string of length `size() + n` whose first `size()` elements are a copy of the original string controlled by `*this` and whose remaining elements are a copy of the initial `n` elements of `s`.9     *Returns:* `*this`.**basic\_string& append(const charT\* s);**10     *Requires:* `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.11     *Effects:* Calls `append(s, traits::length(s))`.12     *Returns:* `*this`.**basic\_string& append(size\_type n, charT c);**13     *Effects:* Equivalent to `append(basic_string(n, c))`.14     *Returns:* `*this`.**template<class InputIterator>****basic\_string& append(InputIterator first, InputIterator last);**15     *Requires:* `[first, last)` is a valid range.16     *Effects:* Equivalent to `append(basic_string(first, last))`.17     *Returns:* `*this`.**basic\_string& append(initializer\_list<charT> il);**18     *Effects:* Calls `append(il.begin(), il.size())`.19     *Returns:* `*this`.**void push\_back(charT c);**20     *Effects:* Equivalent to `append(static_cast<size_type>(1), c)`.

**21.3.1.6.3 basic\_string::assign****[string::assign]**

```
basic_string& assign(const basic_string& str);
```

1     *Effects:* Equivalent to `*this = str`.

2     *Returns:* `*this`.

```
basic_string& assign(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
              allocator_traits<Allocator>::is_always_equal::value);
```

3     *Effects:* Equivalent to `*this = std::move(str)`.

4     *Returns:* `*this`.

```
basic_string&
    assign(const basic_string& str, size_type pos,
           size_type n = npos);
```

5     *Throws:* `out_of_range` if `pos > str.size()`.

6     *Effects:* Determines the effective length `rlen` of the string to assign as the smaller of `n` and `str.size() - pos` and calls `assign(str.data() + pos, rlen)`.

7     *Returns:* `*this`.

```
basic_string& assign(const charT* s, size_type n);
```

8     *Requires:* `s` points to an array of at least `n` elements of `charT`.

9     *Throws:* `length_error` if `n > max_size()`.

10    *Effects:* Replaces the string controlled by `*this` with a string of length `n` whose elements are a copy of those pointed to by `s`.

11    *Returns:* `*this`.

```
basic_string& assign(const charT* s);
```

12    *Requires:* `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.

13    *Effects:* Calls `assign(s, traits::length(s))`.

14    *Returns:* `*this`.

```
basic_string& assign(initializer_list<charT> il);
```

15    *Effects:* Calls `assign(il.begin(), il.size())`.

16    *Returns:* `*this`.

```
basic_string& assign(size_type n, charT c);
```

17    *Effects:* Equivalent to `assign(basic_string(n, c))`.

18    *Returns:* `*this`.

```
template<class InputIterator>
    basic_string& assign(InputIterator first, InputIterator last);
```

19    *Effects:* Equivalent to `assign(basic_string(first, last))`.

20    *Returns:* `*this`.

21.3.1.6.4 `basic_string::insert`

[string::insert]

```
basic_string&
    insert(size_type pos1,
           const basic_string& str);
```

1     *Effects:* Equivalent to: `return insert(pos, str.data(), str.size());`

```
basic_string&
    insert(size_type pos1,
           const basic_string& str,
           size_type pos2, size_type n = npos);
```

2     *Throws:* `out_of_range` if `pos1 > size()` or `pos2 > str.size()`.

3     *Effects:* Determines the effective length `rlen` of the string to insert as the smaller of `n` and `str.size() - pos2` and calls `insert(pos1, str.data() + pos2, rlen)`.

4     *Returns:* `*this`.

```
basic_string&
    insert(size_type pos, const charT* s, size_type n);
```

5     *Requires:* `s` points to an array of at least `n` elements of `charT`.

6     *Throws:* `out_of_range` if `pos > size()` or `length_error` if `size() + n > max_size()`.

7     *Effects:* Replaces the string controlled by `*this` with a string of length `size() + n` whose first `pos` elements are a copy of the initial elements of the original string controlled by `*this` and whose next `n` elements are a copy of the elements in `s` and whose remaining elements are a copy of the remaining elements of the original string controlled by `*this`.

8     *Returns:* `*this`.

```
basic_string&
    insert(size_type pos, const charT* s);
```

9     *Requires:* `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.

10    *Effects:* Equivalent to: `return insert(pos, s, traits::length(s));`

```
basic_string&
    insert(size_type pos, size_type n, charT c);
```

11    *Effects:* Equivalent to `insert(pos, basic_string(n, c))`.

12    *Returns:* `*this`.

```
iterator insert(const_iterator p, charT c);
```

13    *Requires:* `p` is a valid iterator on `*this`.

14    *Effects:* Inserts a copy of `c` before the character referred to by `p`.

15    *Returns:* An iterator which refers to the copy of the inserted character.

```
iterator insert(const_iterator p, size_type n, charT c);
```

16    *Requires:* `p` is a valid iterator on `*this`.

17    *Effects:* Inserts `n` copies of `c` before the character referred to by `p`.

18    *Returns:* An iterator which refers to the copy of the first inserted character, or `p` if `n == 0`.

```
template<class InputIterator>
```

```
    iterator insert(const_iterator p, InputIterator first, InputIterator last);
```

19     *Requires:* `p` is a valid iterator on `*this`. `[first,last)` is a valid range.

20     *Effects:* Equivalent to `insert(p - begin(), basic_string(first, last))`.

21     *Returns:* An iterator which refers to the copy of the first inserted character, or `p` if `first == last`.

```
    iterator insert(const_iterator p, initializer_list<charT> il);
```

22     *Effects:* As if by `insert(p, il.begin(), il.end())`.

23     *Returns:* An iterator which refers to the copy of the first inserted character, or `p` if `il` is empty.

#### 21.3.1.6.5   **basic\_string::erase** [string::erase]

```
basic_string& erase(size_type pos = 0, size_type n = npos);
```

1     *Throws:* `out_of_range` if `pos > size()`.

2     *Effects:* Determines the effective length `xlen` of the string to be removed as the smaller of `n` and `size() - pos`.

3     The function then replaces the string controlled by `*this` with a string of length `size() - xlen` whose first `pos` elements are a copy of the initial elements of the original string controlled by `*this`, and whose remaining elements are a copy of the elements of the original string controlled by `*this` beginning at position `pos + xlen`.

4     *Returns:* `*this`.

```
    iterator erase(const_iterator p);
```

5     *Throws:* Nothing.

6     *Effects:* Removes the character referred to by `p`.

7     *Returns:* An iterator which points to the element immediately following `p` prior to the element being erased. If no such element exists, `end()` is returned.

```
    iterator erase(const_iterator first, const_iterator last);
```

8     *Requires:* `first` and `last` are valid iterators on `*this`, defining a range `[first,last)`.

9     *Throws:* Nothing.

10    *Effects:* Removes the characters in the range `[first,last)`.

11    *Returns:* An iterator which points to the element pointed to by `last` prior to the other elements being erased. If no such element exists, `end()` is returned.

```
    void pop_back();
```

12    *Requires:* `!empty()`.

13    *Throws:* Nothing.

14    *Effects:* Equivalent to `erase(size() - 1, 1)`.

**21.3.1.6.6 basic\_string::replace****[string::replace]****basic\_string&**

```
replace(size_type pos1, size_type n1,
        const basic_string& str);
```

1     *Effects:* Equivalent to: `return replace(pos1, n1, str.data(), str.size());`

**basic\_string&**

```
replace(size_type pos1, size_type n1,
        const basic_string& str,
        size_type pos2, size_type n2 = npos);
```

2     *Throws:* `out_of_range` if `pos1 > size()` or `pos2 > str.size()`.

3     *Effects:* Determines the effective length `rlen` of the string to be inserted as the smaller of `n2` and `str.size() - pos2` and calls `replace(pos1, n1, str.data() + pos2, rlen)`.

4     *Returns:* `*this`.

**basic\_string&**

```
replace(size_type pos1, size_type n1, const charT* s, size_type n2);
```

5     *Requires:* `s` points to an array of at least `n2` elements of `charT`.

6     *Throws:* `out_of_range` if `pos1 > size()` or `length_error` if the length of the resulting string would exceed `max_size()` (see below).

7     *Effects:* Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the string controlled by `*this` with a string of length `size() - xlen + n2` whose first `pos1` elements are a copy of the initial elements of the original string controlled by `*this`, whose next `n2` elements are a copy of the initial `n2` elements of `s`, and whose remaining elements are a copy of the elements of the original string controlled by `*this` beginning at position `pos + xlen`.

8     *Returns:* `*this`.

**basic\_string&**

```
replace(size_type pos, size_type n, const charT* s);
```

9     *Requires:* `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.

10    *Effects:* Equivalent to: `return replace(pos, n, s, traits::length(s));`

**basic\_string&**

```
replace(size_type pos1, size_type n1,
        size_type n2, charT c);
```

11    *Effects:* Equivalent to `replace(pos1, n1, basic_string(n2, c))`.

12    *Returns:* `*this`.

```
basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
```

13    *Requires:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

14    *Effects:* Calls `replace(i1 - begin(), i2 - i1, str)`.

15    *Returns:* `*this`.

**basic\_string&**

```
replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);
```

16 *Requires:* `[begin(), i1)` and `[i1, i2)` are valid ranges and `s` points to an array of at least `n` elements of `charT`.

17 *Effects:* Calls `replace(i1 - begin(), i2 - i1, s, n)`.

18 *Returns:* `*this`.

```
basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);
```

19 *Requires:* `[begin(), i1)` and `[i1, i2)` are valid ranges and `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.

20 *Effects:* Calls `replace(i1 - begin(), i2 - i1, s, traits::length(s))`.

21 *Returns:* `*this`.

```
basic_string& replace(const_iterator i1, const_iterator i2, size_type n,
                    charT c);
```

22 *Requires:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

23 *Effects:* Calls `replace(i1 - begin(), i2 - i1, basic_string(n, c))`.

24 *Returns:* `*this`.

```
template<class InputIterator>
basic_string& replace(const_iterator i1, const_iterator i2,
                    InputIterator j1, InputIterator j2);
```

25 *Requires:* `[begin(), i1)`, `[i1, i2)` and `[j1, j2)` are valid ranges.

26 *Effects:* Calls `replace(i1 - begin(), i2 - i1, basic_string(j1, j2))`.

27 *Returns:* `*this`.

```
basic_string& replace(const_iterator i1, const_iterator i2,
                    initializer_list<charT> il);
```

28 *Requires:* `[begin(), i1)` and `[i1, i2)` are valid ranges.

29 *Effects:* Calls `replace(i1 - begin(), i2 - i1, il.begin(), il.size())`.

30 *Returns:* `*this`.

#### 21.3.1.6.7 `basic_string::copy` [string::copy]

```
size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

2 *Throws:* `out_of_range` if `pos > size()`.

3 *Effects:* Determines the effective length `rlen` of the string to copy as the smaller of `n` and `size() - pos`. `s` shall designate an array of at least `rlen` elements.

The function then replaces the string designated by `s` with a string of length `rlen` whose elements are a copy of the string controlled by `*this` beginning at position `pos`.

The function does not append a null object to the string designated by `s`.

4 *Returns:* `rlen`.

### 21.3.1.6.8 `basic_string::swap` [string::swap]

```
void swap(basic_string& s)
    noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
             allocator_traits<Allocator>::is_always_equal::value);
```

1     *Postcondition:* `*this` contains the same sequence of characters that was in `s`, `s` contains the same sequence of characters that was in `*this`.

2     *Throws:* Nothing.

3     *Complexity:* Constant time.

### 21.3.1.7 `basic_string` string operations [string.ops]

#### 21.3.1.7.1 `basic_string` accessors [string.accessors]

```
const charT* c_str() const noexcept;
const charT* data() const noexcept;
```

1     *Returns:* A pointer `p` such that `p + i == &operator[](i)` for each `i` in `[0, size())`.

2     *Complexity:* Constant time.

3     *Requires:* The program shall not alter any of the values stored in the character array.

```
charT* data() noexcept;
```

4     *Returns:* A pointer `p` such that `p + i == &operator[](i)` for each `i` in `[0, size())`.

5     *Complexity:* Constant time.

6     *Requires:* The program shall not alter the value stored at `p + size()`.

```
allocator_type get_allocator() const noexcept;
```

7     *Returns:* A copy of the `Allocator` object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

#### 21.3.1.7.2 `basic_string::find` [string::find]

```
size_type find(const basic_string& str,
               size_type pos = 0) const noexcept;
```

1     *Effects:* Determines the lowest position `xpos`, if possible, such that both of the following conditions hold:

(1.1)     — `pos <= xpos` and `xpos + str.size() <= size()`;

(1.2)     — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string controlled by `str`.

2     *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

3     *Remarks:* Uses `traits::eq()`.

```
size_type find(const charT* s, size_type pos, size_type n) const;
```

4     *Returns:* `find(basic_string(s,n),pos)`.

```
size_type find(const charT* s, size_type pos = 0) const;
```

5     *Requires:* `s` points to an array of at least `traits::length(s) + 1` elements of `charT`.

6     *Returns:* `find(basic_string(s), pos)`.

```
size_type find(charT c, size_type pos = 0) const;
```

7     *Returns:* `find(basic_string(1,c), pos)`.

**21.3.1.7.3 basic\_string::rfind****[string::rfind]**

```
size_type rfind(const basic_string& str,
                size_type pos = npos) const noexcept;
```

1 *Effects:* Determines the highest position *xpos*, if possible, such that both of the following conditions hold:

- (1.1) — *xpos* <= *pos* and *xpos* + *str.size()* <= *size()*;
- (1.2) — *traits::eq*(*at*(*xpos* + *I*), *str.at*(*I*)) for all elements *I* of the string controlled by *str*.

2 *Returns:* *xpos* if the function can determine such a value for *xpos*. Otherwise, returns *npos*.

3 *Remarks:* Uses *traits::eq*().

```
size_type rfind(const charT* s, size_type pos, size_type n) const;
```

4 *Returns:* *rfind*(*basic\_string*(*s*, *n*), *pos*).

```
size_type rfind(const charT* s, size_type pos = npos) const;
```

5 *Requires:* *s* points to an array of at least *traits::length*(*s*) + 1 elements of *charT*.

6 *Returns:* *rfind*(*basic\_string*(*s*), *pos*).

```
size_type rfind(charT c, size_type pos = npos) const;
```

7 *Returns:* *rfind*(*basic\_string*(1,*c*), *pos*).

**21.3.1.7.4 basic\_string::find\_first\_of****[string::find.first.of]**

```
size_type
find_first_of(const basic_string& str,
              size_type pos = 0) const noexcept;
```

1 *Effects:* Determines the lowest position *xpos*, if possible, such that both of the following conditions hold:

- (1.1) — *pos* <= *xpos* and *xpos* < *size()*;
- (1.2) — *traits::eq*(*at*(*xpos*), *str.at*(*I*)) for some element *I* of the string controlled by *str*.

2 *Returns:* *xpos* if the function can determine such a value for *xpos*. Otherwise, returns *npos*.

3 *Remarks:* Uses *traits::eq*().

```
size_type
find_first_of(const charT* s, size_type pos, size_type n) const;
```

4 *Returns:* *find\_first\_of*(*basic\_string*(*s*, *n*), *pos*).

```
size_type find_first_of(const charT* s, size_type pos = 0) const;
```

5 *Requires:* *s* points to an array of at least *traits::length*(*s*) + 1 elements of *charT*.

6 *Returns:* *find\_first\_of*(*basic\_string*(*s*), *pos*).

```
size_type find_first_of(charT c, size_type pos = 0) const;
```

7 *Returns:* *find\_first\_of*(*basic\_string*(1,*c*), *pos*).

**21.3.1.7.5 basic\_string::find\_last\_of****[string::find.last.of]**

size\_type

```
find_last_of(const basic_string& str,
             size_type pos = npos) const noexcept;
```

1 *Effects:* Determines the highest position *xpos*, if possible, such that both of the following conditions hold:

(1.1) — *xpos* <= *pos* and *xpos* < *size()*;

(1.2) — *traits::eq*(*at*(*xpos*), *str.at*(*I*)) for some element *I* of the string controlled by *str*.

2 *Returns:* *xpos* if the function can determine such a value for *xpos*. Otherwise, returns *npos*.

3 *Remarks:* Uses *traits::eq*().

```
size_type find_last_of(const charT* s, size_type pos, size_type n) const;
```

4 *Returns:* *find\_last\_of*(*basic\_string*(*s*, *n*), *pos*).

```
size_type find_last_of(const charT* s, size_type pos = npos) const;
```

5 *Requires:* *s* points to an array of at least *traits::length*(*s*) + 1 elements of *charT*.

6 *Returns:* *find\_last\_of*(*basic\_string*(*s*), *pos*).

```
size_type find_last_of(charT c, size_type pos = npos) const;
```

7 *Returns:* *find\_last\_of*(*basic\_string*(1,*c*),*pos*).

**21.3.1.7.6 basic\_string::find\_first\_not\_of****[string::find.first.not.of]**

size\_type

```
find_first_not_of(const basic_string& str,
                 size_type pos = 0) const noexcept;
```

1 *Effects:* Determines the lowest position *xpos*, if possible, such that both of the following conditions hold:

(1.1) — *pos* <= *xpos* and *xpos* < *size()*;

(1.2) — *traits::eq*(*at*(*xpos*), *str.at*(*I*)) for no element *I* of the string controlled by *str*.

2 *Returns:* *xpos* if the function can determine such a value for *xpos*. Otherwise, returns *npos*.

3 *Remarks:* Uses *traits::eq*().

size\_type

```
find_first_not_of(const charT* s, size_type pos, size_type n) const;
```

4 *Returns:* *find\_first\_not\_of*(*basic\_string*(*s*, *n*), *pos*).

```
size_type find_first_not_of(const charT* s, size_type pos = 0) const;
```

5 *Requires:* *s* points to an array of at least *traits::length*(*s*) + 1 elements of *charT*.

6 *Returns:* *find\_first\_not\_of*(*basic\_string*(*s*), *pos*).

```
size_type find_first_not_of(charT c, size_type pos = 0) const;
```

7 *Returns:* *find\_first\_not\_of*(*basic\_string*(1, *c*), *pos*).

**21.3.1.7.7 basic\_string::find\_last\_not\_of****[string::find.last.not.of]**

```
size_type
find_last_not_of(const basic_string& str,
                 size_type pos = npos) const noexcept;
```

- 1 *Effects:* Determines the highest position *xpos*, if possible, such that both of the following conditions hold:
- (1.1) — *xpos* <= *pos* and *xpos* < *size()*;
- (1.2) — *traits::eq*(*at*(*xpos*), *str.at*(*I*)) for no element *I* of the string controlled by *str*.
- 2 *Returns:* *xpos* if the function can determine such a value for *xpos*. Otherwise, returns *npos*.
- 3 *Remarks:* Uses *traits::eq*().

```
size_type find_last_not_of(const charT* s, size_type pos,
                          size_type n) const;
```

4 *Returns:* *find\_last\_not\_of*(*basic\_string*(*s*, *n*), *pos*).

```
size_type find_last_not_of(const charT* s, size_type pos = npos) const;
```

5 *Requires:* *s* points to an array of at least *traits::length*(*s*) + 1 elements of *charT*.

6 *Returns:* *find\_last\_not\_of*(*basic\_string*(*s*), *pos*).

```
size_type find_last_not_of(charT c, size_type pos = npos) const;
```

7 *Returns:* *find\_last\_not\_of*(*basic\_string*(1, *c*), *pos*).

**21.3.1.7.8 basic\_string::substr****[string::substr]**

```
basic_string substr(size_type pos = 0, size_type n = npos) const;
```

- 1 *Throws:* *out\_of\_range* if *pos* > *size()*.
- 2 *Effects:* Determines the effective length *rlen* of the string to copy as the smaller of *n* and *size()* - *pos*.
- 3 *Returns:* *basic\_string*(*data()*+*pos*,*rlen*).

**21.3.1.7.9 basic\_string::compare****[string::compare]**

```
int compare(const basic_string& str) const noexcept;
```

- 1 *Effects:* Determines the effective length *rlen* of the strings to compare as the smallest of *size()* and *str.size()*. The function then compares the two strings by calling *traits::compare*(*data()*, *str.data()*, *rlen*).
- 2 *Returns:* The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 74.

Table 74 — *compare()* results

| Condition                          | Return Value |
|------------------------------------|--------------|
| <i>size()</i> < <i>str.size()</i>  | < 0          |
| <i>size()</i> == <i>str.size()</i> | 0            |
| <i>size()</i> > <i>str.size()</i>  | > 0          |

```
int compare(size_type pos1, size_type n1,
            const basic_string& str) const;
```

3       *Returns:* `basic_string(*this,pos1,n1).compare(str)`.

```
int compare(size_type pos1, size_type n1,
            const basic_string& str,
            size_type pos2, size_type n2 = npos) const;
```

4       *Returns:* `basic_string(*this, pos1, n1).compare(basic_string(str, pos2, n2))`.

```
int compare(const charT* s) const;
```

5       *Returns:* `compare(basic_string(s))`.

```
int compare(size_type pos, size_type n1,
            const charT* s) const;
```

6       *Returns:* `basic_string(*this, pos, n1).compare(basic_string(s))`.

```
int compare(size_type pos, size_type n1,
            const charT* s, size_type n2) const;
```

7       *Returns:* `basic_string(*this, pos, n1).compare(basic_string(s, n2))`.

## 21.3.2 basic\_string non-member functions

[string.nonmembers]

### 21.3.2.1 operator+

[string::op+]

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(const basic_string<charT,traits,Allocator>& lhs,
                  const basic_string<charT,traits,Allocator>& rhs);
```

1       *Returns:* `basic_string<charT,traits,Allocator>(lhs).append(rhs)`

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(basic_string<charT,traits,Allocator>&& lhs,
                  const basic_string<charT,traits,Allocator>& rhs);
```

2       *Returns:* `std::move(lhs.append(rhs))`

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(const basic_string<charT,traits,Allocator>& lhs,
                  basic_string<charT,traits,Allocator>&& rhs);
```

3       *Returns:* `std::move(rhs.insert(0, lhs))`

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(basic_string<charT,traits,Allocator>&& lhs,
                  basic_string<charT,traits,Allocator>&& rhs);
```

4       *Returns:* `std::move(lhs.append(rhs))` [Note: Or equivalently `std::move(rhs.insert(0, lhs))`  
— end note]

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(const charT* lhs,
                  const basic_string<charT,traits,Allocator>& rhs);
```

5 *Returns:* `basic_string<charT,traits,Allocator>(lhs) + rhs`.

6 *Remarks:* Uses `traits::length()`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(const charT* lhs,
                    basic_string<charT,traits,Allocator>&& rhs);
```

7 *Returns:* `std::move(rhs.insert(0, lhs))`.

8 *Remarks:* Uses `traits::length()`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(charT lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

9 *Returns:* `basic_string<charT,traits,Allocator>(1, lhs) + rhs`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(charT lhs,
                    basic_string<charT,traits,Allocator>&& rhs);
```

10 *Returns:* `std::move(rhs.insert(0, 1, lhs))`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

11 *Returns:* `lhs + basic_string<charT,traits,Allocator>(rhs)`.

12 *Remarks:* Uses `traits::length()`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(basic_string<charT,traits,Allocator>&& lhs,
                    const charT* rhs);
```

13 *Returns:* `std::move(lhs.append(rhs))`.

14 *Remarks:* Uses `traits::length()`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(const basic_string<charT,traits,Allocator>& lhs,
                    charT rhs);
```

15 *Returns:* `lhs + basic_string<charT,traits,Allocator>(1, rhs)`.

```
template<class charT, class traits, class Allocator>
    basic_string<charT,traits,Allocator>
        operator+(basic_string<charT,traits,Allocator>&& lhs,
                    charT rhs);
```

16 *Returns:* `std::move(lhs.append(1, rhs))`.

**21.3.2.2 operator==****[string::operator==]**

```
template<class charT, class traits, class Allocator>
    bool operator==(const basic_string<charT,traits,Allocator>& lhs,
                    const basic_string<charT,traits,Allocator>& rhs) noexcept;
```

1     *Returns:* lhs.compare(rhs) == 0.

```
template<class charT, class traits, class Allocator>
    bool operator==(const charT* lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

2     *Returns:* rhs == lhs.

```
template<class charT, class traits, class Allocator>
    bool operator==(const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

3     *Requires:* rhs points to an array of at least traits::length(rhs) + 1 elements of charT.

4     *Returns:* lhs.compare(rhs) == 0.

**21.3.2.3 operator!=****[string::op!=]**

```
template<class charT, class traits, class Allocator>
    bool operator!=(const basic_string<charT,traits,Allocator>& lhs,
                    const basic_string<charT,traits,Allocator>& rhs) noexcept;
```

1     *Returns:* !(lhs == rhs).

```
template<class charT, class traits, class Allocator>
    bool operator!=(const charT* lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

2     *Returns:* rhs != lhs.

```
template<class charT, class traits, class Allocator>
    bool operator!=(const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

3     *Requires:* rhs points to an array of at least traits::length(rhs) + 1 elements of charT.

4     *Returns:* lhs.compare(rhs) != 0.

**21.3.2.4 operator<****[string::op<]**

```
template<class charT, class traits, class Allocator>
    bool operator< (const basic_string<charT,traits,Allocator>& lhs,
                    const basic_string<charT,traits,Allocator>& rhs) noexcept;
```

1     *Returns:* lhs.compare(rhs) < 0.

```
template<class charT, class traits, class Allocator>
    bool operator< (const charT* lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

2     *Returns:* rhs.compare(lhs) > 0.

```
template<class charT, class traits, class Allocator>
    bool operator< (const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

3     *Returns:* lhs.compare(rhs) < 0.

**21.3.2.5 operator>****[string::op>]**

```
template<class charT, class traits, class Allocator>
    bool operator> (const basic_string<charT,traits,Allocator>& lhs,
                    const basic_string<charT,traits,Allocator>& rhs) noexcept;
```

1     *Returns:* lhs.compare(rhs) > 0.

```
template<class charT, class traits, class Allocator>
    bool operator> (const charT* lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

2     *Returns:* rhs.compare(lhs) < 0.

```
template<class charT, class traits, class Allocator>
    bool operator> (const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

3     *Returns:* lhs.compare(rhs) > 0.

**21.3.2.6 operator<=****[string::op<=]**

```
template<class charT, class traits, class Allocator>
    bool operator<=(const basic_string<charT,traits,Allocator>& lhs,
                    const basic_string<charT,traits,Allocator>& rhs) noexcept;
```

1     *Returns:* lhs.compare(rhs) <= 0.

```
template<class charT, class traits, class Allocator>
    bool operator<=(const charT* lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

2     *Returns:* rhs.compare(lhs) >= 0.

```
template<class charT, class traits, class Allocator>
    bool operator<=(const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

3     *Returns:* lhs.compare(rhs) <= 0.

**21.3.2.7 operator>=****[string::op>=]**

```
template<class charT, class traits, class Allocator>
    bool operator>=(const basic_string<charT,traits,Allocator>& lhs,
                    const basic_string<charT,traits,Allocator>& rhs) noexcept;
```

1     *Returns:* lhs.compare(rhs) >= 0.

```
template<class charT, class traits, class Allocator>
    bool operator>=(const charT* lhs,
                    const basic_string<charT,traits,Allocator>& rhs);
```

2     *Returns:* rhs.compare(lhs) <= 0.

```
template<class charT, class traits, class Allocator>
    bool operator>=(const basic_string<charT,traits,Allocator>& lhs,
                    const charT* rhs);
```

3     *Returns:* lhs.compare(rhs) >= 0.

## 21.3.2.8 swap

[string.special]

```
template<class charT, class traits, class Allocator>
void swap(basic_string<charT,traits,Allocator>& lhs,
         basic_string<charT,traits,Allocator>& rhs)
noexcept(noexcept(lhs.swap(rhs)));
```

1 *Effects:* Equivalent to: `lhs.swap(rhs);`

## 21.3.2.9 Inserters and extractors

[string.io]

```
template<class charT, class traits, class Allocator>
basic_istream<charT,traits>&
operator>>(basic_istream<charT,traits>& is,
         basic_string<charT,traits,Allocator>& str);
```

1 *Effects:* Behaves as a formatted input function (27.7.2.2.1). After constructing a `sentry` object, if the `sentry` converts to true, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1,c)`. If `is.width()` is greater than zero, the maximum number `n` of characters appended is `is.width()`; otherwise `n` is `str.max_size()`. Characters are extracted and appended until any of the following occurs:

- (1.1) — `n` characters are stored;
- (1.2) — end-of-file occurs on the input sequence;
- (1.3) — `isspace(c,is.getloc())` is true for the next available input character `c`.

2 After the last character (if any) is extracted, `is.width(0)` is called and the `sentry` object `k` is destroyed.

3 If the function extracts no characters, it calls `is.setstate(ios::failbit)`, which may throw `ios_base::failure` (27.5.5.4).

4 *Returns:* `is`

```
template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
         const basic_string<charT,traits,Allocator>& str);
```

5 *Effects:* Behaves as a formatted output function (27.7.3.6.1) of `os`. Forms a character sequence `seq`, initially consisting of the elements defined by the range `[str.begin(), str.end())`. Determines padding for `seq` as described in 27.7.3.6.1. Then inserts `seq` as if by calling `os.rdbuf()->sputn(seq, n)`, where `n` is the larger of `os.width()` and `str.size()`; then calls `os.width(0)`.

6 *Returns:* `os`

```
template<class charT, class traits, class Allocator>
basic_istream<charT,traits>&
getline(basic_istream<charT,traits>& is,
       basic_string<charT,traits,Allocator>& str,
       charT delim);
template<class charT, class traits, class Allocator>
basic_istream<charT,traits>&
getline(basic_istream<charT,traits>&& is,
       basic_string<charT,traits,Allocator>& str,
       charT delim);
```

7 *Effects:* Behaves as an unformatted input function (27.7.2.3), except that it does not affect the value returned by subsequent calls to `basic_istream<>::gcount()`. After constructing a `sentry` object, if the `sentry` converts to true, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)` until any of the following occurs:

- (7.1) — end-of-file occurs on the input sequence (in which case, the `getline` function calls `is.setstate( ios_base::eofbit)`).
- (7.2) — `traits::eq(c, delim)` for the next available input character *c* (in which case, *c* is extracted but not appended) (27.5.5.4)
- (7.3) — `str.max_size()` characters are stored (in which case, the function calls `is.setstate( ios_base::failbit)`) (27.5.5.4)
- 8 The conditions are tested in the order shown. In any case, after the last character is extracted, the `sentry` object *k* is destroyed.
- 9 If the function extracts no characters, it calls `is.setstate( ios_base::failbit)` which may throw `ios_base::failure` (27.5.5.4).
- 10 *Returns:* `is`.

```
template<class charT, class traits, class Allocator>
    basic_istream<charT,traits>&
        getline(basic_istream<charT,traits>& is,
                basic_string<charT,traits,Allocator>& str);
template<class charT, class traits, class Allocator>
    basic_istream<charT,traits>&
        getline(basic_istream<charT,traits>&& is,
                basic_string<charT,traits,Allocator>& str);
```

11 *Returns:* `getline(is, str, is.widen('\n'))`

### 21.3.3 Numeric conversions

[string.conversions]

```
int stoi(const string& str, size_t* idx = 0, int base = 10);
long stol(const string& str, size_t* idx = 0, int base = 10);
unsigned long stoul(const string& str, size_t* idx = 0, int base = 10);
long long stoll(const string& str, size_t* idx = 0, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = 0, int base = 10);
```

1 *Effects:* the first two functions call `strtoul(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument *ptr* designates a pointer to an object internal to the function that is used to determine what to store at *\*idx*. If the function does not throw an exception and *idx* != 0, the function stores in *\*idx* the index of the first unconverted element of *str*.

2 *Returns:* The converted result.

3 *Throws:* `invalid_argument` if `strtoul`, `strtoll`, or `strtoull` reports that no conversion could be performed. Throws `out_of_range` if `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = 0);
double stod(const string& str, size_t* idx = 0);
long double stold(const string& str, size_t* idx = 0);
```

4 *Effects:* These functions call `strtoul(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument *ptr* designates a pointer to an object internal to the function that is used to determine what to store at *\*idx*. If the function does not throw an exception and *idx* != 0, the function stores in *\*idx* the index of the first unconverted element of *str*.

5 *Returns:* The converted result.

- 6 *Throws:* `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion could be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

- 7 *Returns:* Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of `"%d"`, `"%u"`, `"%ld"`, `"%lu"`, `"%lld"`, `"%llu"`, `"%f"`, `"%f"`, or `"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size.

```
int stoi(const wstring& str, size_t* idx = 0, int base = 10);
long stol(const wstring& str, size_t* idx = 0, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = 0, int base = 10);
long long stoll(const wstring& str, size_t* idx = 0, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = 0, int base = 10);
```

- 8 *Effects:* the first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 9 *Returns:* The converted result.

- 10 *Throws:* `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion could be performed. Throws `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = 0);
double stod(const wstring& str, size_t* idx = 0);
long double stold(const wstring& str, size_t* idx = 0);
```

- 11 *Effects:* These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

- 12 *Returns:* The converted result.

- 13 *Throws:* `invalid_argument` if `wcstof`, `wcstod`, or `wcstold` reports that no conversion could be performed. Throws `out_of_range` if `wcstof`, `wcstod`, or `wcstold` sets `errno` to `ERANGE`.

```
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
```

```
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

- <sup>14</sup> *Returns:* Each function returns a `wstring` object holding the character representation of the value of its argument that would be generated by calling `swprintf(buf, buffsz, fmt, val)` with a format specifier of `L"%d"`, `L"%u"`, `L"%ld"`, `L"%lu"`, `L"%lld"`, `L"%llu"`, `L"%f"`, `L"%F"`, or `L"%Lf"`, respectively, where `buf` designates an internal character buffer of sufficient size `buffsz`.

### 21.3.4 Hash support

[basic.string.hash]

```
template<> struct hash<string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;
template<> struct hash<wstring>;
```

- <sup>1</sup> The template specializations shall meet the requirements of class template `hash` (20.12.14).

### 21.3.5 Suffix for `basic_string` literals

[basic.string.literals]

```
string operator "" s(const char* str, size_t len);
```

- <sup>1</sup> *Returns:* `string{str, len}`.

```
u16string operator "" s(const char16_t* str, size_t len);
```

- <sup>2</sup> *Returns:* `u16string{str, len}`.

```
u32string operator "" s(const char32_t* str, size_t len);
```

- <sup>3</sup> *Returns:* `u32string{str, len}`.

```
wstring operator "" s(const wchar_t* str, size_t len);
```

- <sup>4</sup> *Returns:* `wstring{str, len}`.

- <sup>5</sup> [Note: The same suffix `s` is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

## 21.4 String view classes

[string.view]

- <sup>1</sup> The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (21.1) objects with the first element of the sequence at position zero. In the rest of this section, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.

- <sup>2</sup> [Note: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types should define their own implicit conversions to `std::basic_string_view` in order to interoperate with these functions. — end note]

- <sup>3</sup> The complexity of `basic_string_view` member functions is  $\mathcal{O}(1)$  unless otherwise specified.

**21.4.1 Header <string\_view> synopsis**

[string.view.synop]

```

namespace std {
    // 21.4.2, class template basic_string_view
    template<class charT, class traits = char_traits<charT>>
    class basic_string_view;

    // 21.4.3, non-member comparison functions
    template<class charT, class traits>
        constexpr bool operator==(basic_string_view<charT, traits> x,
                                   basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
        constexpr bool operator!=(basic_string_view<charT, traits> x,
                                   basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
        constexpr bool operator< (basic_string_view<charT, traits> x,
                                   basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
        constexpr bool operator> (basic_string_view<charT, traits> x,
                                   basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
        constexpr bool operator<= (basic_string_view<charT, traits> x,
                                    basic_string_view<charT, traits> y) noexcept;
    template<class charT, class traits>
        constexpr bool operator>= (basic_string_view<charT, traits> x,
                                    basic_string_view<charT, traits> y) noexcept;
    // see below, sufficient additional overloads of comparison functions

    // 21.4.4, inserters and extractors
    template<class charT, class traits>
        basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,
                   basic_string_view<charT, traits> str);

    // basic_string_view typedef names
    typedef basic_string_view<char> string_view;
    typedef basic_string_view<char16_t> u16string_view;
    typedef basic_string_view<char32_t> u32string_view;
    typedef basic_string_view<wchar_t> wstring_view;

    // 21.4.5, hash support
    template<class T> struct hash;
    template<> struct hash<string_view>;
    template<> struct hash<u16string_view>;
    template<> struct hash<u32string_view>;
    template<> struct hash<wstring_view>;
}

```

<sup>1</sup> The function templates defined in 20.2.2 and 24.7 are available when <string\_view> is included.

**21.4.2 Class template basic\_string\_view**

[string.view.template]

```

template<class charT, class traits = char_traits<charT>>
class basic_string_view {
public:
    // types
    typedef traits traits_type;

```

```

typedef charT value_type;
typedef charT* pointer;
typedef const charT* const_pointer;
typedef charT& reference;
typedef const charT& const_reference;
typedef implementation-defined const_iterator; // see 21.4.2.2
typedef const_iterator iterator;234
typedef reverse_iterator<const_iterator> const_reverse_iterator;
typedef const_reverse_iterator reverse_iterator;
typedef size_t size_type;
typedef ptrdiff_t difference_type;
static constexpr size_type npos = size_type(-1);

// 21.4.2.1, construction and assignment
constexpr basic_string_view() noexcept;
constexpr basic_string_view(const basic_string_view&) noexcept = default;
basic_string_view &operator=(const basic_string_view&) noexcept = default;
template <class Allocator>
    basic_string_view(const basic_string<charT, traits, Allocator>& str) noexcept;
constexpr basic_string_view(const charT* str);
constexpr basic_string_view(const charT* str, size_type len);

// 21.4.2.2, iterator support
constexpr const_iterator begin() const noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 21.4.2.3, capacity
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr bool empty() const noexcept;

// 21.4.2.4, element access
constexpr const_reference operator[](size_type pos) const;
constexpr const_reference at(size_type pos) const;
constexpr const_reference front() const;
constexpr const_reference back() const;
constexpr const_pointer data() const noexcept;

// 21.4.2.5, modifiers
constexpr void remove_prefix(size_type n);
constexpr void remove_suffix(size_type n);
constexpr void swap(basic_string_view& s) noexcept;

// 21.4.2.6, string operations
template <class Allocator>
    explicit operator basic_string<charT, traits, Allocator>() const;

```

<sup>234)</sup> Because `basic_string_view` refers to a constant sequence, `iterator` and `const_iterator` are the same type.

```

template <class Allocator = allocator<charT>>
    basic_string<charT, traits, Allocator> to_string(
        const Allocator& a = Allocator()) const;

size_type copy(charT* s, size_type n, size_type pos = 0) const;

constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
constexpr int compare(basic_string_view s) const noexcept;
constexpr int compare(size_type pos1, size_type n1, basic_string_view s) const;
constexpr int compare(size_type pos1, size_type n1, basic_string_view s,
    size_type pos2, size_type n2) const;
constexpr int compare(const charT* s) const;
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
constexpr int compare(size_type pos1, size_type n1, const charT* s,
    size_type n2) const;
constexpr size_type find(basic_string_view s, size_type pos = 0) const noexcept;
constexpr size_type find(charT c, size_type pos = 0) const noexcept;
constexpr size_type find(const charT* s, size_type pos, size_type n) const;
constexpr size_type find(const charT* s, size_type pos = 0) const;
constexpr size_type rfind(basic_string_view s, size_type pos = npos) const noexcept;
constexpr size_type rfind(charT c, size_type pos = npos) const noexcept;
constexpr size_type rfind(const charT* s, size_type pos, size_type n) const;
constexpr size_type rfind(const charT* s, size_type pos = npos) const;
constexpr size_type find_first_of(basic_string_view s, size_type pos = 0) const noexcept;
constexpr size_type find_first_of(charT c, size_type pos = 0) const noexcept;
constexpr size_type find_first_of(const charT* s, size_type pos, size_type n) const;
constexpr size_type find_first_of(const charT* s, size_type pos = 0) const;
constexpr size_type find_last_of(basic_string_view s, size_type pos = npos) const noexcept;
constexpr size_type find_last_of(charT c, size_type pos = npos) const noexcept;
constexpr size_type find_last_of(const charT* s, size_type pos, size_type n) const;
constexpr size_type find_last_of(const charT* s, size_type pos = npos) const;
constexpr size_type find_first_not_of(basic_string_view s, size_type pos = 0) const noexcept;
constexpr size_type find_first_not_of(charT c, size_type pos = 0) const noexcept;
constexpr size_type find_first_not_of(const charT* s, size_type pos,
    size_type n) const;
constexpr size_type find_first_not_of(const charT* s, size_type pos = 0) const;
constexpr size_type find_last_not_of(basic_string_view s,
    size_type pos = npos) const noexcept;
constexpr size_type find_last_not_of(charT c, size_type pos = npos) const noexcept;
constexpr size_type find_last_not_of(const charT* s, size_type pos,
    size_type n) const;
constexpr size_type find_last_not_of(const charT* s, size_type pos = npos) const;

private:
    const_pointer data_; // exposition only
    size_type size_;     // exposition only
};

```

- <sup>1</sup> In every specialization `basic_string_view<charT, traits>`, the type `traits` shall satisfy the character traits requirements (21.2), and the type `traits::char_type` shall name the same type as `charT`.

#### 21.4.2.1 Construction and assignment [string.view.cons]

```
constexpr basic_string_view() noexcept;
```

- <sup>1</sup> *Effects:* Constructs an empty `basic_string_view`.

2 *Postconditions:* `size_ == 0` and `data_ == nullptr`.

```
template<class Allocator>
basic_string_view(const basic_string<charT, traits, Allocator>& str) noexcept;
```

3 *Effects:* Constructs a `basic_string_view`, with the postconditions in table 75.

Table 75 — `basic_string_view(const basic_string&)` effects

| Element            | Value                   |
|--------------------|-------------------------|
| <code>data_</code> | <code>str.data()</code> |
| <code>size_</code> | <code>str.size()</code> |

```
constexpr basic_string_view(const charT* str);
```

4 *Requires:* `[str, str + traits::length(str))` is a valid range.

5 *Effects:* Constructs a `basic_string_view`, with the postconditions in table 76.

Table 76 — `basic_string_view(const charT*)` effects

| Element            | Value                            |
|--------------------|----------------------------------|
| <code>data_</code> | <code>str</code>                 |
| <code>size_</code> | <code>traits::length(str)</code> |

6 *Complexity:*  $\mathcal{O}(\text{traits::length(str)})$ .

```
constexpr basic_string_view(const charT* str, size_type len);
```

7 *Requires:* `[str, str + len)` is a valid range.

8 *Effects:* Constructs a `basic_string_view`, with the postconditions in table 77.

Table 77 — `basic_string_view(const charT*, size_type)` effects

| Element            | Value            |
|--------------------|------------------|
| <code>data_</code> | <code>str</code> |
| <code>size_</code> | <code>len</code> |

### 21.4.2.2 Iterator support

[string.view.iterators]

```
typedef implementation-defined const_iterator;
```

1 A constant random-access iterator type such that, for a `const_iterator` `it`, if `&*(it + N)` is valid, then `&*(it + N) == (&*it) + N`.

2 For a `basic_string_view` `str`, any operation that invalidates a pointer in the range `[str.data(), str.data() + str.size())` invalidates pointers, iterators, and references returned from `str`'s methods.

3 All requirements on container iterators (23.2) apply to `basic_string_view::const_iterator` as well.

```
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

4 *Returns:* An iterator such that

(4.1) — if `!empty()`, `&*begin() == data_`,

(4.2) — otherwise, an unspecified value such that `[begin(), end())` is a valid range.

```
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

5 *Returns:* `begin() + size()`.

```
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator crbegin() const noexcept;
```

6 *Returns:* `const_reverse_iterator(end())`.

```
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crend() const noexcept;
```

7 *Returns:* `const_reverse_iterator(begin())`.

### 21.4.2.3 Capacity

[string.view.capacity]

```
constexpr size_type size() const noexcept;
```

1 *Returns:* `size_`.

```
constexpr size_type length() const noexcept;
```

2 *Returns:* `size_`.

```
constexpr size_type max_size() const noexcept;
```

3 *Returns:* The largest possible number of char-like objects that can be referred to by a `basic_string_view`.

```
constexpr bool empty() const noexcept;
```

4 *Returns:* `size_ == 0`.

### 21.4.2.4 Element access

[string.view.access]

```
constexpr const_reference operator[](size_type pos) const;
```

1 *Requires:* `pos < size()`.

2 *Returns:* `data_[pos]`.

3 *Throws:* Nothing.

4 [ *Note:* Unlike `basic_string::operator[]`, `basic_string_view::operator[](size())` has undefined behavior instead of returning `charT()`. — *end note* ]

```
constexpr const_reference at(size_type pos) const;
```

5 *Throws:* `out_of_range` if `pos >= size()`.

6 *Returns:* `data_[pos]`.

```
constexpr const_reference front() const;
```

7 *Requires:* `!empty()`.

8 *Returns:* `data_[0]`.

9 *Throws:* Nothing.

```
constexpr const_reference back() const;
```

10 *Requires:* !empty().

11 *Returns:* data\_[size() - 1].

12 *Throws:* Nothing.

constexpr const\_pointer data() const noexcept;

13 *Returns:* data\_.

14 [ *Note:* Unlike basic\_string::data() and string literals, data() may return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a routine that takes just a const charT\* and expects a null-terminated string. — end note ]

#### 21.4.2.5 Modifiers

[string.view.modifiers]

constexpr void remove\_prefix(size\_type n);

1 *Requires:* n <= size().

2 *Effects:* Equivalent to: data\_ += n; size\_ -= n;

constexpr void remove\_suffix(size\_type n);

3 *Requires:* n <= size().

4 *Effects:* Equivalent to: size\_ -= n;

constexpr void swap(basic\_string\_view& s) noexcept;

5 *Effects:* Exchanges the values of \*this and s.

#### 21.4.2.6 String operations

[string.view.ops]

template<class Allocator>

explicit<sup>235</sup> operator basic\_string<charT, traits, Allocator>() const;

1 *Effects:* Equivalent to: return basic\_string<charT, traits, Allocator>(begin(), end());

2 *Complexity:*  $\mathcal{O}(\text{size}())$ .

3 [ *Note:* Users who want to control the allocator instance should call to\_string(allocator). — end note ]

template<class Allocator = allocator<charT>>

basic\_string<charT, traits, Allocator>

to\_string(const Allocator& a = Allocator()) const;

4 *Returns:* basic\_string<charT, traits, Allocator>(begin(), end(), a).

5 *Complexity:*  $\mathcal{O}(\text{size}())$ .

size\_type copy(charT\* s, size\_type n, size\_type pos = 0) const;

6 Let rlen be the smaller of n and size() - pos.

7 *Throws:* out\_of\_range if pos > size().

8 *Requires:* [s, s + rlen) is a valid range.

9 *Effects:* Equivalent to copy\_n(begin() + pos, rlen, s).

10 *Returns:* rlen.

11 *Complexity:*  $\mathcal{O}(\text{rlen})$ .

---

235) This conversion is explicit to avoid accidental operations with linear complexity on type mismatches.

```
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
```

12 Let `rlen` be the smaller of `n` and `size() - pos`.

13 *Throws:* `out_of_range` if `pos > size()`.

14 *Effects:* Determines `rlen`, the effective length of the string to reference.

15 *Returns:* `basic_string_view(data() + pos, rlen)`.

```
constexpr int compare(basic_string_view str) const noexcept;
```

16 Let `rlen` be the smaller of `size()` and `str.size()`.

17 *Effects:* Determines `rlen`, the effective length of the strings to compare. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`.

18 *Complexity:*  $\mathcal{O}(\text{rlen})$ .

19 *Returns:* The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 78.

Table 78 — `compare()` results

| Condition                           | Return Value        |
|-------------------------------------|---------------------|
| <code>size() &lt; str.size()</code> | <code>&lt; 0</code> |
| <code>size() == str.size()</code>   | <code>0</code>      |
| <code>size() &gt; str.size()</code> | <code>&gt; 0</code> |

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

20 *Effects:* Equivalent to: `return substr(pos1, n1).compare(str);`

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                      size_type pos2, size_type n2) const;
```

21 *Effects:* Equivalent to: `return substr(pos1, n1).compare(str.substr(pos2, n2));`

```
constexpr int compare(const charT* s) const;
```

22 *Effects:* Equivalent to: `return compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

23 *Effects:* Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1,
                      const charT* s, size_type n2) const;
```

24 *Effects:* Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s, n2));`

#### 21.4.2.7 Searching

[string.view.find]

1 This section specifies the `basic_string_view` member functions named `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

2 Member functions in this section have complexity  $\mathcal{O}(\text{size()} * \text{str.size}())$  at worst, although implementations are encouraged to do better.

3 Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos);
```

is equivalent to `return F(basic_string_view(s), pos);`

4 Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos, size_type n);
```

is equivalent to `return F(basic_string_view(s, n), pos);`

5 Each member function of the form

```
constexpr return-type F(charT c, size_type pos);
```

is equivalent to `return F(basic_string_view(&c, 1), pos);`

```
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

6 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(6.1) — `pos <= xpos`

(6.2) — `xpos + str.size() <= size()`

(6.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string referenced by `str`.

7 *Effects:* Determines `xpos`.

8 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

9 *Remarks:* Uses `traits::eq()`.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

10 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(10.1) — `xpos <= pos`

(10.2) — `xpos + str.size() <= size()`

(10.3) — `traits::eq(at(xpos + I), str.at(I))` for all elements `I` of the string referenced by `str`.

11 *Effects:* Determines `xpos`.

12 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

13 *Remarks:* Uses `traits::eq()`.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

14 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(14.1) — `pos <= xpos`

(14.2) — `xpos < size()`

(14.3) — `traits::eq(at(xpos), str.at(I))` for some element `I` of the string referenced by `str`.

15 *Effects:* Determines `xpos`.

16 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

17 *Remarks:* Uses `traits::eq()`.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let `xpos` be the highest position, if possible, such that the following conditions hold:

(18.1) — `xpos <= pos`

(18.2) — `xpos < size()`

(18.3) — `traits::eq(at(xpos), str.at(I))` for some element `I` of the string referenced by `str`.

19 *Effects:* Determines `xpos`.

20 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

21 *Remarks:* Uses `traits::eq()`.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

22 Let `xpos` be the lowest position, if possible, such that the following conditions hold:

(22.1) — `pos <= xpos`

(22.2) — `xpos < size()`

(22.3) — `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

23 *Effects:* Determines `xpos`.

24 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

25 *Remarks:* Uses `traits::eq()`.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

26 Let `xpos` the highest position, if possible, such that the following conditions hold:

(26.1) — `xpos <= pos`

(26.2) — `xpos < size()`

(26.3) — `traits::eq(at(xpos), str.at(I))` for no element `I` of the string referenced by `str`.

27 *Effects:* Determines `xpos`.

28 *Returns:* `xpos` if the function can determine such a value for `xpos`. Otherwise, returns `npos`.

29 *Remarks:* Uses `traits::eq()`.

### 21.4.3 Non-member comparison functions

[string.view.comparison]

- <sup>1</sup> Let `S` be `basic_string_view<charT, traits>`, and `sv` be an instance of `S`. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object `t` with an implicit conversion to `S` can be compared according to table 79.

[Example: A sample conforming implementation for `operator==` would be:

```
template<class T> using __identity = decay_t<T>;
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                          basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                          __identity<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(__identity<basic_string_view<charT, traits>> lhs,
                          basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
```

Table 79 — Additional `basic_string_view` comparison overloads

| Expression              | Equivalent to              |
|-------------------------|----------------------------|
| <code>t == sv</code>    | <code>S(t) == sv</code>    |
| <code>sv == t</code>    | <code>sv == S(t)</code>    |
| <code>t != sv</code>    | <code>S(t) != sv</code>    |
| <code>sv != t</code>    | <code>sv != S(t)</code>    |
| <code>t &lt; sv</code>  | <code>S(t) &lt; sv</code>  |
| <code>sv &lt; t</code>  | <code>sv &lt; S(t)</code>  |
| <code>t &gt; sv</code>  | <code>S(t) &gt; sv</code>  |
| <code>sv &gt; t</code>  | <code>sv &gt; S(t)</code>  |
| <code>t &lt;= sv</code> | <code>S(t) &lt;= sv</code> |
| <code>sv &lt;= t</code> | <code>sv &lt;= S(t)</code> |
| <code>t &gt;= sv</code> | <code>S(t) &gt;= sv</code> |
| <code>sv &gt;= t</code> | <code>sv &gt;= S(t)</code> |

— *end example*]

```
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                          basic_string_view<charT, traits> rhs) noexcept;
```

2     *Returns:* `lhs.compare(rhs) == 0`.

```
template<class charT, class traits>
constexpr bool operator!=(basic_string_view<charT, traits> lhs,
                          basic_string_view<charT, traits> rhs) noexcept;
```

3     *Returns:* `lhs.compare(rhs) != 0`.

```
template<class charT, class traits>
constexpr bool operator<(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;
```

4     *Returns:* `lhs.compare(rhs) < 0`.

```
template<class charT, class traits>
constexpr bool operator>(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;
```

5     *Returns:* `lhs.compare(rhs) > 0`.

```
template<class charT, class traits>
constexpr bool operator<=(basic_string_view<charT, traits> lhs,
                          basic_string_view<charT, traits> rhs) noexcept;
```

6     *Returns:* `lhs.compare(rhs) <= 0`.

```
template<class charT, class traits>
constexpr bool operator>=(basic_string_view<charT, traits> lhs,
                          basic_string_view<charT, traits> rhs) noexcept;
```

7     *Returns:* `lhs.compare(rhs) >= 0`.

#### 21.4.4 Inserters and extractors

[string.view.io]

```
template<class charT, class traits>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,
                    basic_string_view<charT, traits> str);
```

<sup>1</sup> *Effects:* Equivalent to: `return os << str.to_string();`

#### 21.4.5 Hash support

[string.view.hash]

```
template<> struct hash<string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

<sup>1</sup> The template specializations shall meet the requirements of class template hash (20.12.14).

#### 21.5 Null-terminated sequence utilities

[c.strings]

<sup>1</sup> Tables 81, 82, 83, 84, 85, and 86 describe headers `<cctype>`, `<cwctype>`, `<cstring>`, `<wchar>`, `<cstdlib>` (character conversions), and `<cuchar>`, respectively.

<sup>2</sup> The contents of these headers shall be the same as the Standard C Library headers `<ctype.h>`, `<wctype.h>`, `<string.h>`, `<wchar.h>`, and `<stdlib.h>` and the C Unicode TR header `<uchar.h>`, respectively, with the following modifications:

<sup>3</sup> The headers shall not define the types `char16_t`, `char32_t`, and `wchar_t` (2.11).

<sup>4</sup> The function signature `strchr(const char*, int)` shall be replaced by the two declarations:

```
const char* strchr(const char* s, int c);
char* strchr(      char* s, int c);
```

both of which shall have the same behavior as the original declaration.

<sup>5</sup> The function signature `strpbrk(const char*, const char*)` shall be replaced by the two declarations:

```
const char* strpbrk(const char* s1, const char* s2);
char* strpbrk(      char* s1, const char* s2);
```

both of which shall have the same behavior as the original declaration.

<sup>6</sup> The function signature `strrchr(const char*, int)` shall be replaced by the two declarations:

```
const char* strrchr(const char* s, int c);
char* strrchr(      char* s, int c);
```

both of which shall have the same behavior as the original declaration.

<sup>7</sup> The function signature `strstr(const char*, const char*)` shall be replaced by the two declarations:

```
const char* strstr(const char* s1, const char* s2);
char* strstr(      char* s1, const char* s2);
```

both of which shall have the same behavior as the original declaration.

<sup>8</sup> The function signature `memchr(const void*, int, size_t)` shall be replaced by the two declarations:

```
const void* memchr(const void* s, int c, size_t n);
void* memchr(      void* s, int c, size_t n);
```

both of which shall have the same behavior as the original declaration.

<sup>9</sup> The function signature `wcschr(const wchar_t*, wchar_t)` shall be replaced by the two declarations:

```
const wchar_t* wcschr(const wchar_t* s, wchar_t c);
wchar_t* wcschr(      wchar_t* s, wchar_t c);
```

both of which shall have the same behavior as the original declaration.

- 10 The function signature `wcspbrk(const wchar_t*, const wchar_t*)` shall be replaced by the two declarations:

```
const wchar_t* wcspbrk(const wchar_t* s1, const wchar_t* s2);
wchar_t* wcspbrk(      wchar_t* s1, const wchar_t* s2);
```

both of which shall have the same behavior as the original declaration.

- 11 The function signature `wcsrchr(const wchar_t*, wchar_t)` shall be replaced by the two declarations:

```
const wchar_t* wcsrchr(const wchar_t* s, wchar_t c);
wchar_t* wcsrchr(      wchar_t* s, wchar_t c);
```

both of which shall have the same behavior as the original declaration.

- 12 The function signature `wcsstr(const wchar_t*, const wchar_t*)` shall be replaced by the two declarations:

```
const wchar_t* wcsstr(const wchar_t* s1, const wchar_t* s2);
wchar_t* wcsstr(      wchar_t* s1, const wchar_t* s2);
```

both of which shall have the same behavior as the original declaration.

- 13 The function signature `wmemchr(const wchar_t*, int, size_t)` shall be replaced by the two declarations:

```
const wchar_t* wmemchr(const wchar_t* s, wchar_t c, size_t n);
wchar_t* wmemchr(      wchar_t* s, wchar_t c, size_t n);
```

both of which shall have the same behavior as the original declaration.

- 14 The functions `strerror` and `strtok` are not required to avoid data races (17.6.5.9).
- 15 Calling the functions listed in Table 80 with an `mbstate_t*` argument of `NULL` may introduce a data race (17.6.5.9) with other calls to these functions with an `mbstate_t*` argument of `NULL`.

Table 80 — Potential `mbstate_t` data races

|                        |                      |                        |                     |                      |
|------------------------|----------------------|------------------------|---------------------|----------------------|

## 22 Localization library

[localization]

### 22.1 General

[localization.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.
- <sup>2</sup> The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 87.

Table 87 — Localization library summary

|                      | Subclause                       | Header(s) |
|----------------------|---------------------------------|-----------|
| <a href="#">22.3</a> | Locales                         | <locale>  |
| <a href="#">22.4</a> | Standard locale Categories      |           |
| <a href="#">22.5</a> | Standard code conversion facets | <codecvt> |
| <a href="#">22.6</a> | C library locales               | <clocale> |

### 22.2 Header <locale> synopsis

[locale.syn]

```

namespace std {
    // 22.3.1, locale:
    class locale;
    template <class Facet> const Facet& use_facet(const locale&);
    template <class Facet> bool      has_facet(const locale&) noexcept;

    // 22.3.3, convenience interfaces:
    template <class charT> bool isspace (charT c, const locale& loc);
    template <class charT> bool isprint (charT c, const locale& loc);
    template <class charT> bool iscntrl (charT c, const locale& loc);
    template <class charT> bool isupper (charT c, const locale& loc);
    template <class charT> bool islower (charT c, const locale& loc);
    template <class charT> bool isalpha (charT c, const locale& loc);
    template <class charT> bool isdigit (charT c, const locale& loc);
    template <class charT> bool ispunct (charT c, const locale& loc);
    template <class charT> bool isxdigit(charT c, const locale& loc);
    template <class charT> bool isalnum (charT c, const locale& loc);
    template <class charT> bool isgraph (charT c, const locale& loc);
    template <class charT> bool isblank (charT c, const locale& loc);
    template <class charT> charT toupper(charT c, const locale& loc);
    template <class charT> charT tolower(charT c, const locale& loc);
    template <class Codecvt, class Elem = wchar_t,
        class Wide_alloc = std::allocator<Elem>,
        class Byte_alloc = std::allocator<char> > class wstring_convert;
    template <class Codecvt, class Elem = wchar_t,
        class Tr = char_traits<Elem>> class wbuffer_convert;

    // 22.4.1, ctype:
    class ctype_base;

```

```

template <class charT> class ctype;
template <>          class ctype<char>;           // specialization
template <class charT> class ctype_byname;
class codecvt_base;
template <class internT, class externT, class stateT> class codecvt;
template <class internT, class externT, class stateT> class codecvt_byname;

// 22.4.2, numeric:
template <class charT, class InputIterator = istreambuf_iterator<charT> > class num_get;
template <class charT, class OutputIterator = ostreambuf_iterator<charT> > class num_put;
template <class charT> class numpunct;
template <class charT> class numpunct_byname;

// 22.4.4, collation:
template <class charT> class collate;
template <class charT> class collate_byname;

// 22.4.5, date and time:
class time_base;
template <class charT, class InputIterator = istreambuf_iterator<charT> >
    class time_get;
template <class charT, class InputIterator = istreambuf_iterator<charT> >
    class time_get_byname;
template <class charT, class OutputIterator = ostreambuf_iterator<charT> >
    class time_put;
template <class charT, class OutputIterator = ostreambuf_iterator<charT> >
    class time_put_byname;

// 22.4.6, money:
class money_base;
template <class charT, class InputIterator = istreambuf_iterator<charT> > class money_get;
template <class charT, class OutputIterator = ostreambuf_iterator<charT> > class money_put;
template <class charT, bool Intl = false> class money_punct;
template <class charT, bool Intl = false> class money_punct_byname;

// 22.4.7, message retrieval:
class messages_base;
template <class charT> class messages;
template <class charT> class messages_byname;
}

```

<sup>1</sup> The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.<sup>236</sup>

## 22.3 Locales

[locales]

### 22.3.1 Class locale

[locale]

```

namespace std {
    class locale {
    public:
        // types:
        class facet;
        class id;
        typedef int category;
    };
}

```

<sup>236</sup>) In this subclause, the type name `struct tm` is an incomplete type that is defined in `<ctime>`.

```

static const category    // values assigned here are for exposition only
    none      = 0,
    collate   = 0x010, ctype   = 0x020,
    monetary  = 0x040, numeric = 0x080,
    time      = 0x100, messages = 0x200,
    all = collate | ctype | monetary | numeric | time | messages;

// construct/copy/destroy:
locale() noexcept;
locale(const locale& other) noexcept;
explicit locale(const char* std_name);
explicit locale(const string& std_name);
locale(const locale& other, const char* std_name, category);
locale(const locale& other, const string& std_name, category);
template <class Facet> locale(const locale& other, Facet* f);
locale(const locale& other, const locale& one, category);
~locale(); // not virtual
const locale& operator=(const locale& other) noexcept;
template <class Facet> locale combine(const locale& other) const;

// locale operations:
basic_string<char>      name() const;

bool operator==(const locale& other) const;
bool operator!=(const locale& other) const;

template <class charT, class traits, class Allocator>
    bool operator()(const basic_string<charT,traits,Allocator>& s1,
                    const basic_string<charT,traits,Allocator>& s2) const;

// global locale objects:
static locale global(const locale&);
static const locale& classic();
};
}

```

- <sup>1</sup> Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.
- <sup>2</sup> Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.
- <sup>3</sup> [Example: An `ostream` operator<< might be implemented as:<sup>237</sup>

```

template <class charT, class traits>
basic_ostream<charT,traits>&
operator<< (basic_ostream<charT,traits>& s, Date d) {
    typename basic_ostream<charT,traits>::sentry cerberos(s);
    if (cerberos) {
        ios_base::iostate err = ios_base::iostate::goodbit;
        tm tmbuf; d.extract(tmbuf);
        use_facet< time_put<charT,ostreambuf_iterator<charT,traits> > >>(
            s.getloc()).put(s, s, s.fill(), err, &tmbuf, 'x');
        s.setstate(err); // might throw
    }
}

```

<sup>237</sup>) Note that in the call to `put` the stream is implicitly converted to an `ostreambuf_iterator<charT,traits>`.

```
    return s;
}
```

— *end example*]

- 4 In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets (22.4.8).
- 5 [ *Note*: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:
  - (5.1) — A member operator template `operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)` is provided so that a locale may be used as a predicate argument to the standard collections, to collate strings.
  - (5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c,loc)`. (This eases upgrading existing extractors (27.7.2.2).) — *end note*]
- 6 Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.
- 7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.
- 8 A `locale` constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "\*".
- 9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (17.6.5.9).

### 22.3.1.1 locale types

[**locale.types**]

#### 22.3.1.1.1 Type `locale::category`

[**locale.category**]

```
typedef int category;
```

- 1 *Valid* `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

- 2 `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 88.
- 3 For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 88, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

Table 88 — Locale category facets

| Category | Includes facets                                                                                                                                                                                                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collate  | <code>collate&lt;char&gt;</code> , <code>collate&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                               |
| ctype    | <code>ctype&lt;char&gt;</code> , <code>ctype&lt;wchar_t&gt;</code><br><code>codecvt&lt;char, char, mbstate_t&gt;</code><br><code>codecvt&lt;char16_t, char, mbstate_t&gt;</code><br><code>codecvt&lt;char32_t, char, mbstate_t&gt;</code><br><code>codecvt&lt;wchar_t, char, mbstate_t&gt;</code>                                    |
| monetary | <code>moneypunct&lt;char&gt;</code> , <code>moneypunct&lt;wchar_t&gt;</code><br><code>moneypunct&lt;char, true&gt;</code> , <code>moneypunct&lt;wchar_t, true&gt;</code><br><code>money_get&lt;char&gt;</code> , <code>money_get&lt;wchar_t&gt;</code><br><code>money_put&lt;char&gt;</code> , <code>money_put&lt;wchar_t&gt;</code> |
| numeric  | <code>numput&lt;char&gt;</code> , <code>numput&lt;wchar_t&gt;</code><br><code>num_get&lt;char&gt;</code> , <code>num_get&lt;wchar_t&gt;</code><br><code>num_put&lt;char&gt;</code> , <code>num_put&lt;wchar_t&gt;</code>                                                                                                             |
| time     | <code>time_get&lt;char&gt;</code> , <code>time_get&lt;wchar_t&gt;</code><br><code>time_put&lt;char&gt;</code> , <code>time_put&lt;wchar_t&gt;</code>                                                                                                                                                                                 |
| messages | <code>messages&lt;char&gt;</code> , <code>messages&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                             |

- <sup>4</sup> An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 89.
- <sup>5</sup> The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>` (1) only for facet `F` of types `numput<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.
- <sup>6</sup> In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that satisfy the requirements of an Input Iterator or an Output Iterator, respectively (24.2). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that satisfy the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a `bool` parameter.

#### 22.3.1.1.2 Class `locale::facet`

[`locale.facet`]

```

namespace std {
    class locale::facet {
    protected:
        explicit facet(size_t refs = 0);
        virtual ~facet();
        facet(const facet&) = delete;
        void operator=(const facet&) = delete;
    };
}

```

- <sup>1</sup> Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A `const`-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.
- <sup>2</sup> The `refs` argument to the constructor is used for lifetime management.
- (2.1) — For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`,

Table 89 — Required specializations

| Category | Includes facets                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collate  | <code>collate_byname&lt;char&gt;</code> , <code>collate_byname&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                                                                                                                                                     |
| ctype    | <code>ctype_byname&lt;char&gt;</code> , <code>ctype_byname&lt;wchar_t&gt;</code><br><code>codecvt_byname&lt;char, char, mbstate_t&gt;</code><br><code>codecvt_byname&lt;char16_t, char, mbstate_t&gt;</code><br><code>codecvt_byname&lt;char32_t, char, mbstate_t&gt;</code><br><code>codecvt_byname&lt;wchar_t, char, mbstate_t&gt;</code>                                                                                                                              |
| monetary | <code>moneypunct_byname&lt;char, International&gt;</code><br><code>moneypunct_byname&lt;wchar_t, International&gt;</code><br><code>money_get&lt;C, InputIterator&gt;</code><br><code>money_put&lt;C, OutputIterator&gt;</code>                                                                                                                                                                                                                                           |
| numeric  | <code>numpunct_byname&lt;char&gt;</code> , <code>numpunct_byname&lt;wchar_t&gt;</code><br><code>num_get&lt;C, InputIterator&gt;</code> , <code>num_put&lt;C, OutputIterator&gt;</code>                                                                                                                                                                                                                                                                                   |
| time     | <code>time_get&lt;char, InputIterator&gt;</code><br><code>time_get_byname&lt;char, InputIterator&gt;</code><br><code>time_get&lt;wchar_t, InputIterator&gt;</code><br><code>time_get_byname&lt;wchar_t, InputIterator&gt;</code><br><code>time_put&lt;char, OutputIterator&gt;</code><br><code>time_put_byname&lt;char, OutputIterator&gt;</code><br><code>time_put&lt;wchar_t, OutputIterator&gt;</code><br><code>time_put_byname&lt;wchar_t, OutputIterator&gt;</code> |
| messages | <code>messages_byname&lt;char&gt;</code> , <code>messages_byname&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                                                                                                                                                   |

the implementation never destroys the facet.

- <sup>3</sup> Constructors of all facets defined in this Clause take such an argument and pass it along to their **facet** base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in automatic conversions.
- <sup>4</sup> For some standard facets a standard “...\_byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a **refs** argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a **string** argument **str** and a **refs** argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and **refs**. If there is no “...\_byname” version of a facet, the base class implements named locale semantics itself by reference to other facets.

#### 22.3.1.1.3 Class `locale::id`

[`locale.id`]

```
namespace std {
    class locale::id {
    public:
        id();
        void operator=(const id&) = delete;
        id(const id&) = delete;
    };
}
```

- <sup>1</sup> The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

- <sup>2</sup> [*Note:* Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (3.6.2). — *end note*]

### 22.3.1.2 locale constructors and destructor

[locale.cons]

`locale()` `noexcept`;

- <sup>1</sup> Default constructor: a snapshot of the current global locale.
- <sup>2</sup> *Effects:* Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.  
 [*Note:* This constructor is commonly used as the default value for arguments of functions that take a `const locale&` argument. — *end note*]

`locale(const locale& other)` `noexcept`;

- <sup>3</sup> *Effects:* Constructs a locale which is a copy of `other`.

`explicit locale(const char* std_name);`

- <sup>4</sup> *Effects:* Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.
- <sup>5</sup> *Throws:* `runtime_error` if the argument is not valid, or is null.
- <sup>6</sup> *Remarks:* The set of valid string argument values is "C", "", and any implementation-defined values.

`explicit locale(const string& std_name);`

- <sup>7</sup> *Effects:* The same as `locale(std_name.c_str())`.

`locale(const locale& other, const char* std_name, category);`

- <sup>8</sup> *Effects:* Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.
- <sup>9</sup> *Throws:* `runtime_error` if the argument is not valid, or is null.
- <sup>10</sup> *Remarks:* The locale has a name if and only if `other` has a name.

`locale(const locale& other, const string& std_name, category cat);`

- <sup>11</sup> *Effects:* The same as `locale(other, std_name.c_str(), cat)`.

`template <class Facet> locale(const locale& other, Facet* f);`

- <sup>12</sup> *Effects:* Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.
- <sup>13</sup> *Remarks:* The resulting locale has no name.

`locale(const locale& other, const locale& one, category cats);`

- <sup>14</sup> *Effects:* Constructs a locale incorporating all facets from the first argument except those that implement `cats`, which are instead incorporated from the second argument.
- <sup>15</sup> *Remarks:* The resulting locale has a name if and only if the first two arguments have names.

`const locale& operator=(const locale& other) noexcept;`

16 *Effects:* Creates a copy of **other**, replacing the current value.

17 *Returns:* **\*this**

`~locale();`

18 A non-virtual destructor that throws no exceptions.

### 22.3.1.3 locale members

[**locale.members**]

`template <class Facet> locale combine(const locale& other) const;`

1 *Effects:* Constructs a locale incorporating all facets from **\*this** except for that one facet of **other** that is identified by **Facet**.

2 *Returns:* The newly created locale.

3 *Throws:* `runtime_error` if `has_facet<Facet>(other)` is false.

4 *Remarks:* The resulting locale has no name.

`basic_string<char> name() const;`

5 *Returns:* The name of **\*this**, if it has one; otherwise, the string `"*"`. If **\*this** has a name, then `locale(name()).c_str()` is equivalent to **\*this**. Details of the contents of the resulting string are otherwise implementation-defined.

### 22.3.1.4 locale operators

[**locale.operators**]

`bool operator==(const locale& other) const;`

1 *Returns:* `true` if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; `false` otherwise.

`bool operator!=(const locale& other) const;`

2 *Returns:* The result of the expression: `!(*this == other)`.

`template <class charT, class traits, class Allocator>  
bool operator()(const basic_string<charT,traits,Allocator>& s1,  
const basic_string<charT,traits,Allocator>& s2) const;`

3 *Effects:* Compares two strings according to the `collate<charT>` facet.

4 *Remarks:* This member operator template (and therefore **locale** itself) satisfies requirements for a comparator predicate template argument (Clause 25) applied to strings.

5 *Returns:* The result of the following expression:

```
use_facet< collate<charT> >(*this).compare  
(s1.data(), s1.data()+s1.size(), s2.data(), s2.data()+s2.size()) < 0;
```

6 [*Example:* A vector of strings `v` can be collated according to collation rules in locale `loc` simply by (25.5.1, 23.3.11):

```
std::sort(v.begin(), v.end(), loc);
```

— end example]

**22.3.1.5 locale static members****[locale.statics]**

```
static locale global(const locale& loc);
```

1 Sets the global locale to its argument.

2 *Effects:* Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
std::setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined. No library function other than `locale::global()` shall affect the value returned by `locale()`. [Note: See 22.6 for data race considerations when `setlocale` is invoked. — end note]

3 *Returns:* The previous value of `locale()`.

```
static const locale& classic();
```

4 The "C" locale.

5 *Returns:* A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.

6 *Remarks:* This locale, its facets, and their member functions, do not change with time.

**22.3.2 locale globals****[locale.global.templates]**

```
template <class Facet> const Facet& use_facet(const locale& loc);
```

1 *Requires:* Facet is a facet class whose definition contains the public static member `id` as defined in 22.3.1.1.2.

2 *Returns:* A reference to the corresponding facet of `loc`, if present.

3 *Throws:* `bad_cast` if `has_facet<Facet>(loc)` is false.

4 *Remarks:* The reference returned remains valid at least as long as any copy of `loc` exists.

```
template <class Facet> bool has_facet(const locale& loc) noexcept;
```

5 *Returns:* True if the facet requested is present in `loc`; otherwise false.

**22.3.3 Convenience interfaces****[locale.convenience]****22.3.3.1 Character classification****[classification]**

```
template <class charT> bool isspace (charT c, const locale& loc);
template <class charT> bool isprint (charT c, const locale& loc);
template <class charT> bool iscntrl (charT c, const locale& loc);
template <class charT> bool isupper (charT c, const locale& loc);
template <class charT> bool islower (charT c, const locale& loc);
template <class charT> bool isalpha (charT c, const locale& loc);
template <class charT> bool isdigit (charT c, const locale& loc);
template <class charT> bool ispunct (charT c, const locale& loc);
template <class charT> bool isxdigit(charT c, const locale& loc);
template <class charT> bool isalnum (charT c, const locale& loc);
template <class charT> bool isgraph (charT c, const locale& loc);
template <class charT> bool isblank (charT c, const locale& loc);
```

1 Each of these functions `isF` returns the result of the expression:

```
use_facet< ctype<charT> >(loc).is(ctype_base::F, c)
```

where  $F$  is the `ctype_base::mask` value corresponding to that function (22.4.1).<sup>238</sup>

### 22.3.3.2 Conversions

[conversions]

#### 22.3.3.2.1 Character conversions

[conversions.character]

```
template <class charT> charT toupper(charT c, const locale& loc);
```

<sup>1</sup> *Returns:* `use_facet<ctype<charT>>(loc).toupper(c)`.

```
template <class charT> charT tolower(charT c, const locale& loc);
```

<sup>2</sup> *Returns:* `use_facet<ctype<charT>>(loc).tolower(c)`.

#### 22.3.3.2.2 string conversions

[conversions.string]

<sup>1</sup> Class template `wstring_convert` performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales. [ *Example:* If you want to use the code conversion facet `codecvt_utf8` to output to `cout` a UTF-8 multibyte sequence corresponding to a wide string, but you don't want to alter the locale for `cout`, you can write something like:

```
wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
```

— *end example*]

<sup>2</sup> Class template `wstring_convert` synopsis

```
namespace std {
template<class Codecvt, class Elem = wchar_t,
        class Wide_alloc = std::allocator<Elem>,
        class Byte_alloc = std::allocator<char>> class wstring_convert {
public:
    typedef std::basic_string<char, char_traits<char>, Byte_alloc> byte_string;
    typedef std::basic_string<Elem, char_traits<Elem>, Wide_alloc> wide_string;
    typedef typename Codecvt::state_type state_type;
    typedef typename wide_string::traits_type::int_type int_type;

    explicit wstring_convert(Codecvt* pcvt = new Codecvt);
    wstring_convert(Codecvt* pcvt, state_type state);
    explicit wstring_convert(const byte_string& byte_err,
                            const wide_string& wide_err = wide_string());
    ~wstring_convert();

    wstring_convert(const wstring_convert&) = delete;
    wstring_convert& operator=(const wstring_convert&) = delete;

    wide_string from_bytes(char byte);
    wide_string from_bytes(const char* ptr);
    wide_string from_bytes(const byte_string& str);
    wide_string from_bytes(const char* first, const char* last);

    byte_string to_bytes(Elem wchar);
    byte_string to_bytes(const Elem* wptr);
    byte_string to_bytes(const wide_string& wstr);
    byte_string to_bytes(const Elem* first, const Elem* last);
```

238) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`.

```

    size_t converted() const noexcept;
    state_type state() const;
private:
    byte_string byte_err_string;    // exposition only
    wide_string wide_err_string;    // exposition only
    Codecvt* cvtptr;               // exposition only
    state_type cvtstate;           // exposition only
    size_t cvtcount;               // exposition only
};
}

```

3 The class template describes an object that controls conversions between wide string objects of class `std::basic_string<Elem, char_traits<Elem>, Wide_alloc>` and byte string objects of class `std::basic_string<char, char_traits<char>, Byte_alloc>`. The class template defines the types `wide_string` and `byte_string` as synonyms for these two types. Conversion between a sequence of `Elem` values (stored in a `wide_string` object) and multibyte sequences (stored in a `byte_string` object) is performed by an object of class `Codecvt`, which meets the requirements of the standard code-conversion facet `std::codecvt<Elem, char, std::mbstate_t>`.

4 An object of this class template stores:

- (4.1) — `byte_err_string` — a byte string to display on errors
- (4.2) — `wide_err_string` — a wide string to display on errors
- (4.3) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wstring_convert` object is destroyed)
- (4.4) — `cvtstate` — a conversion state object
- (4.5) — `cvtcount` — a conversion count

```
typedef std::basic_string<char, char_traits<char>, Byte_alloc> byte_string;
```

5 The type shall be a synonym for `std::basic_string<char, char_traits<char>, Byte_alloc>`

```
size_t converted() const noexcept;
```

6 *Returns:* `cvtcount`.

```

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

```

7 *Effects:* The first member function shall convert the single-element sequence `byte` to a wide string. The second member function shall convert the null-terminated sequence beginning at `ptr` to a wide string. The third member function shall convert the sequence stored in `str` to a wide string. The fourth member function shall convert the sequence defined by the range `[first, last)` to a wide string.

8 In all cases:

- (8.1) — If the `cvtstate` object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
- (8.2) — The number of input elements successfully converted shall be stored in `cvtcount`.

9 *Returns:* If no conversion error occurs, the member function shall return the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function shall return the wide-error string. Otherwise, the member function throws an object of class `std::range_error`.

```
typedef typename wide_string::traits_type::int_type int_type;
```

The type shall be a synonym for `wide_string::traits_type::int_type`.

```
state_type state() const;
```

10 returns `cvtstate`.

```
typedef typename Codecvt::state_type state_type;
```

11 The type shall be a synonym for `Codecvt::state_type`.

```
byte_string to_bytes(Elem wchar);
```

```
byte_string to_bytes(const Elem* wptr);
```

```
byte_string to_bytes(const wide_string& wstr);
```

```
byte_string to_bytes(const Elem* first, const Elem* last);
```

12 *Effects:* The first member function shall convert the single-element sequence `wchar` to a byte string. The second member function shall convert the null-terminated sequence beginning at `wptr` to a byte string. The third member function shall convert the sequence stored in `wstr` to a byte string. The fourth member function shall convert the sequence defined by the range `[first, last)` to a byte string.

13 In all cases:

(13.1) — If the `cvtstate` object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.

(13.2) — The number of input elements successfully converted shall be stored in `cvtcount`.

14 *Returns:* If no conversion error occurs, the member function shall return the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function shall return the byte-error string. Otherwise, the member function shall throw an object of class `std::range_error`.

```
typedef std::basic_string<Elem, char_traits<Elem>, Wide_alloc> wide_string;
```

15 The type shall be a synonym for `std::basic_string<Elem, char_traits<Elem>, Wide_alloc>`.

```
explicit wstring_convert(Codecvt* pcvt = new Codecvt);
```

```
wstring_convert(Codecvt* pcvt, state_type state);
```

```
explicit wstring_convert(const byte_string& byte_err,
    const wide_string& wide_err = wide_string());
```

16 *Requires:* For the first and second constructors, `pcvt != nullptr`.

17 *Effects:* The first constructor shall store `pcvt` in `cvtptr` and default values in `cvtstate`, `byte_err_string`, and `wide_err_string`. The second constructor shall store `pcvt` in `cvtptr`, `state` in `cvtstate`, and default values in `byte_err_string` and `wide_err_string`; moreover the stored state shall be retained between calls to `from_bytes` and `to_bytes`. The third constructor shall store new `Codecvt` in `cvtptr`, `state_type()` in `cvtstate`, `byte_err` in `byte_err_string`, and `wide_err` in `wide_err_string`.

```
~wstring_convert();
```

18 *Effects:* The destructor shall delete `cvtptr`.

### 22.3.3.2.3 Buffer conversions

[conversions.buffer]

- <sup>1</sup> Class template `wbuffer_convert` looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template `wstring_convert`, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

<sup>2</sup> **Class template `wbuffer_convert` synopsis**

```
namespace std {
template<class Codecvt,
        class Elem = wchar_t,
        class Tr = std::char_traits<Elem> >
class wbuffer_convert
    : public std::basic_streambuf<Elem, Tr> {
public:
    typedef typename Codecvt::state_type state_type;

    explicit wbuffer_convert(std::streambuf* bytebuf = 0,
                            Codecvt* pcvt = new Codecvt,
                            state_type state = state_type());

    ~wbuffer_convert();

    wbuffer_convert(const wbuffer_convert&) = delete;
    wbuffer_convert& operator=(const wbuffer_convert&) = delete;

    std::streambuf* rdbuf() const;
    std::streambuf* rdbuf(std::streambuf* bytebuf);

    state_type state() const;

private:
    std::streambuf* bufptr;           // exposition only
    Codecvt* cvtptr;                 // exposition only
    state_type cvtstate;              // exposition only
};
}
```

- <sup>3</sup> The class template describes a stream buffer that controls the transmission of elements of type `Elem`, whose character traits are described by the class `Tr`, to and from a byte stream buffer of type `std::streambuf`. Conversion between a sequence of `Elem` values and multibyte sequences is performed by an object of class `Codecvt`, which shall meet the requirements of the standard code-conversion facet `std::codecvt<Elem, char, std::mbstate_t>`.

- <sup>4</sup> An object of this class template stores:

- (4.1) — `bufptr` — a pointer to its underlying byte stream buffer
- (4.2) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wbuffer_convert` object is destroyed)
- (4.3) — `cvtstate` — a conversion state object

```
state_type state() const;
```

- <sup>5</sup> *Returns:* `cvtstate`.

```
std::streambuf* rdbuf() const;
```

6       *Returns:* `bufptr`.

```
std::streambuf* rdbuf(std::streambuf* bytebuf);
```

7       *Effects:* Stores `bytebuf` in `bufptr`.

8       *Returns:* The previous value of `bufptr`.

```
typedef typename Codecvt::state_type state_type;
```

9       The type shall be a synonym for `Codecvt::state_type`.

```
explicit wbuffer_convert(std::streambuf* bytebuf = 0,
    Codecvt* pcvt = new Codecvt, state_type state = state_type());
```

10      *Requires:* `pcvt != nullptr`.

11      *Effects:* The constructor constructs a stream buffer object, initializes `bufptr` to `bytebuf`, initializes `cvtptr` to `pcvt`, and initializes `cvtstate` to `state`.

```
~wbuffer_convert();
```

12      *Effects:* The destructor shall delete `cvtptr`.

## 22.4 Standard locale categories

[[locale.categories](#)]

- 1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators << and >>, as members `put()` and `get()`, respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum ([27.5.3](#)). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.
- 2 The `put()` members make no provision for error reporting. (Any failures of the `OutputIterator` argument must be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.
- 3 Within this clause it is unspecified whether one virtual function calls another virtual function.

### 22.4.1 The ctype category

[[category.ctype](#)]

```
namespace std {
    class ctype_base {
    public:
        typedef T mask;

        // numeric values are for exposition only.
        static const mask space = 1 << 0;
        static const mask print = 1 << 1;
        static const mask cntrl = 1 << 2;
        static const mask upper = 1 << 3;
        static const mask lower = 1 << 4;
        static const mask alpha = 1 << 5;
        static const mask digit = 1 << 6;
        static const mask punct = 1 << 7;
        static const mask xdigit = 1 << 8;
        static const mask blank = 1 << 9;
        static const mask alnum = alpha | digit;
        static const mask graph = alnum | punct;
    };
}
```

- <sup>1</sup> The type mask is a bitmask type (17.5.2.1.3).

### 22.4.1.1 Class template ctype

[locale.ctype]

```
namespace std {
    template <class charT>
    class ctype : public locale::facet, public ctype_base {
    public:
        typedef charT char_type;

        explicit ctype(size_t refs = 0);

        bool is(mask m, charT c) const;
        const charT* is(const charT* low, const charT* high, mask* vec) const;
        const charT* scan_is(mask m,
                               const charT* low, const charT* high) const;
        const charT* scan_not(mask m,
                               const charT* low, const charT* high) const;
        charT toupper(charT c) const;
        const charT* toupper(charT* low, const charT* high) const;
        charT tolower(charT c) const;
        const charT* tolower(charT* low, const charT* high) const;

        charT widen(char c) const;
        const char* widen(const char* low, const char* high, charT* to) const;
        char narrow(charT c, char dfault) const;
        const charT* narrow(const charT* low, const charT* high, char dfault,
                             char* to) const;

        static locale::id id;

    protected:
        ~ctype();
        virtual bool do_is(mask m, charT c) const;
        virtual const charT* do_is(const charT* low, const charT* high,
                                   mask* vec) const;
        virtual const charT* do_scan_is(mask m,
                                         const charT* low, const charT* high) const;
        virtual const charT* do_scan_not(mask m,
                                         const charT* low, const charT* high) const;
        virtual charT do_toupper(charT) const;
        virtual const charT* do_toupper(charT* low, const charT* high) const;
        virtual charT do_tolower(charT) const;
        virtual const charT* do_tolower(charT* low, const charT* high) const;
        virtual charT do_widen(char) const;
        virtual const char* do_widen(const char* low, const char* high,
                                     charT* dest) const;
        virtual char do_narrow(charT, char dfault) const;
        virtual const charT* do_narrow(const charT* low, const charT* high,
                                       char dfault, char* dest) const;
    };
}
```

- <sup>1</sup> Class `ctype` encapsulates the C library `<cctype>` features. `istream` members are required to use `ctype<>` for character classing during input parsing.
- <sup>2</sup> The specializations required in Table 88 (22.3.1.1.1), namely `ctype<char>` and `ctype<wchar_t>`, implement

character classing appropriate to the implementation's native character set.

#### 22.4.1.1.1 ctype members

[locale.ctype.members]

```
bool          is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high,
                mask* vec) const;
```

1     *Returns:* do\_is(m,c) or do\_is(low,high,vec)

```
const charT* scan_is(mask m,
                    const charT* low, const charT* high) const;
```

2     *Returns:* do\_scan\_is(m,low,high)

```
const charT* scan_not(mask m,
                    const charT* low, const charT* high) const;
```

3     *Returns:* do\_scan\_not(m,low,high)

```
charT         toupper(charT c) const;
const charT* toupper(charT* low, const charT* high) const;
```

4     *Returns:* do\_toupper(c) or do\_toupper(low,high)

```
charT         tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;
```

5     *Returns:* do\_tolower(c) or do\_tolower(low,high)

```
charT         widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
```

6     *Returns:* do\_widen(c) or do\_widen(low,high,to)

```
char          narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault,
                    char* to) const;
```

7     *Returns:* do\_narrow(c,dfault) or do\_narrow(low,high,dfault,to)

#### 22.4.1.1.2 ctype virtual functions

[locale.ctype.virtuals]

```
bool          do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high,
                mask* vec) const;
```

1     *Effects:* Classifies a character or sequence of characters. For each argument character, identifies a value M of type ctype\_base::mask. The second form identifies a value M of type ctype\_base::mask for each \*p where (low<=p && p<high), and places it into vec[p-low].

2     *Returns:* The first form returns the result of the expression (M & m) != 0; i.e., true if the character has the characteristics specified. The second form returns high.

```
const charT* do_scan_is(mask m,
                    const charT* low, const charT* high) const;
```

3     *Effects:* Locates a character in a buffer that conforms to a classification m.

4     *Returns:* The smallest pointer p in the range [low, high) such that is(m,\*p) would return true; otherwise, returns high.

```
const charT* do_scan_not(mask m,
                        const charT* low, const charT* high) const;
```

5 *Effects:* Locates a character in a buffer that fails to conform to a classification *m*.

6 *Returns:* The smallest pointer *p*, if any, in the range [*low*, *high*) such that *is(m,\*p)* would return *false*; otherwise, returns *high*.

```
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

7 *Effects:* Converts a character or characters to upper case. The second form replaces each character *\*p* in the range [*low*, *high*) for which a corresponding upper-case character exists, with that character.

8 *Returns:* The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns *high*.

```
charT do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;
```

9 *Effects:* Converts a character or characters to lower case. The second form replaces each character *\*p* in the range [*low*, *high*) and for which a corresponding lower-case character exists, with that character.

10 *Returns:* The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns *high*.

```
charT do_widen(char c) const;
const char* do_widen(const char* low, const char* high,
                    charT* dest) const;
```

11 *Effects:* Applies the simplest reasonable transformation from a *char* value or sequence of *char* values to the corresponding *charT* value or values.<sup>239</sup> The only characters for which unique transformations are required are those in the basic source character set (2.3).

For any named *ctype* category with a *ctype<charT>* facet *ctc* and valid *ctype\_base::mask* value *M*, (*ctc.is(M, c) || !is(M, do\_widen(c))*) is true.<sup>240</sup>

The second form transforms each character *\*p* in the range [*low*, *high*), placing the result in *dest[p-low]*.

12 *Returns:* The first form returns the transformed value. The second form returns *high*.

```
char do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high,
                      char dfault, char* dest) const;
```

13 *Effects:* Applies the simplest reasonable transformation from a *charT* value or sequence of *charT* values to the corresponding *char* value or values.

For any character *c* in the basic source character set (2.3) the transformation is such that

```
do_widen(do_narrow(c,0)) == c
```

For any named *ctype* category with a *ctype<char>* facet *ctc* however, and *ctype\_base::mask* value *M*,

```
(is(M,c) || !ctc.is(M, do_narrow(c,dfault)))
```

239) The *char* argument of *do\_widen* is intended to accept values derived from character literals for conversion to the locale's encoding.

240) In other words, the transformed character is not a member of any character classification that *c* is not also a member of.

is true (unless `do_narrow` returns `dfault`). In addition, for any digit character `c`, the expression `(do_narrow(c, dfault) - '0')` evaluates to the digit value of the character. The second form transforms each character `*p` in the range `[low, high)`, placing the result (or `dfault` if no simple transformation is readily available) in `dest[p-low]`.

14 *Returns:* The first form returns the transformed value; or `dfault` if no mapping is readily available. The second form returns `high`.

#### 22.4.1.2 Class template `ctype_byname`

[`locale.ctype.byname`]

```
namespace std {
    template <class charT>
    class ctype_byname : public ctype<charT> {
    public:
        typedef typename ctype<charT>::mask mask;
        explicit ctype_byname(const char*, size_t refs = 0);
        explicit ctype_byname(const string&, size_t refs = 0);
    protected:
        ~ctype_byname();
    };
}
```

#### 22.4.1.3 `ctype` specializations

[`facet.ctype.special`]

```
namespace std {
    template <> class ctype<char>
        : public locale::facet, public ctype_base {
    public:
        typedef char char_type;

        explicit ctype(const mask* tab = 0, bool del = false,
                       size_t refs = 0);

        bool is(mask m, char c) const;
        const char* is(const char* low, const char* high, mask* vec) const;
        const char* scan_is (mask m,
                             const char* low, const char* high) const;
        const char* scan_not(mask m,
                             const char* low, const char* high) const;

        char toupper(char c) const;
        const char* toupper(char* low, const char* high) const;
        char tolower(char c) const;
        const char* tolower(char* low, const char* high) const;

        char widen(char c) const;
        const char* widen(const char* low, const char* high, char* to) const;
        char narrow(char c, char dfault) const;
        const char* narrow(const char* low, const char* high, char dfault,
                           char* to) const;

        static locale::id id;
        static const size_t table_size = implementation-defined;

        const mask* table() const noexcept;
        static const mask* classic_table() noexcept;
    };
}
```

```
protected:
~ctype();
virtual char      do_toupper(char c) const;
virtual const char* do_toupper(char* low, const char* high) const;
virtual char      do_tolower(char c) const;
virtual const char* do_tolower(char* low, const char* high) const;

virtual char      do_widen(char c) const;
virtual const char* do_widen(const char* low,
                           const char* high,
                           char* to) const;
virtual char      do_narrow(char c, char dfaul) const;
virtual const char* do_narrow(const char* low,
                           const char* high,
                           char dfaul, char* to) const;
};
}
```

- <sup>1</sup> A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.<sup>241</sup> The implementation-defined value of member `table_size` is at least 256.

#### 22.4.1.3.1 `ctype<char>` destructor [facet.ctype.char.dtor]

```
~ctype();
```

- <sup>1</sup> *Effects:* If the constructor's first argument was nonzero, and its second argument was true, does `delete [] table()`.

#### 22.4.1.3.2 `ctype<char>` members [facet.ctype.char.members]

- <sup>1</sup> In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = 0, bool del = false,
              size_t refs = 0);
```

- <sup>2</sup> *Requires:* `tbl` either 0 or an array of at least `table_size` elements.

- <sup>3</sup> *Effects:* Passes its `refs` argument to its base class constructor.

```
bool      is(mask m, char c) const;
const char* is(const char* low, const char* high,
              mask* vec) const;
```

- <sup>4</sup> *Effects:* The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p-low]` the value `table()[ (unsigned char)*p]`.

- <sup>5</sup> *Returns:* The first form returns `table()[ (unsigned char)c] & m`; the second form returns `high`.

```
const char* scan_is(mask m,
                  const char* low, const char* high) const;
```

- <sup>6</sup> *Returns:* The smallest `p` in the range `[low, high)` such that

```
table()[ (unsigned char) *p] & m
```

is true.

---

241) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

```
const char* scan_not(mask m,
                     const char* low, const char* high) const;
```

7     *Returns:* The smallest *p* in the range [*low*, *high*) such that  
        `table()[(unsigned char) *p] & m`  
        is false.

```
char           toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

8     *Returns:* `do_toupper(c)` or `do_toupper(low,high)`, respectively.

```
char           tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

9     *Returns:* `do_tolower(c)` or `do_tolower(low,high)`, respectively.

```
char   widen(char c) const;
const char* widen(const char* low, const char* high,
                  char* to) const;
```

10    *Returns:* `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char           narrow(char c, char ddefault) const;
const char* narrow(const char* low, const char* high,
                   char ddefault, char* to) const;
```

11    *Returns:* `do_narrow(c, ddefault)` or `do_narrow(low, high, ddefault, to)`, respectively.

```
const mask* table() const noexcept;
```

12    *Returns:* The first constructor argument, if it was non-zero, otherwise `classic_table()`.

#### 22.4.1.3.3   ctype<char> static members [facet.ctype.char.statics]

```
static const mask* classic_table() noexcept;
```

1     *Returns:* A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the "C" locale.

#### 22.4.1.3.4   ctype<char> virtual functions [facet.ctype.char.virtuals]

```
char           do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char           do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;
```

```
virtual char       do_widen(char c) const;
virtual const char* do_widen(const char* low,
                           const char* high,
                           char* to) const;
virtual char       do_narrow(char c, char ddefault) const;
virtual const char* do_narrow(const char* low,
                           const char* high,
                           char ddefault, char* to) const;
```

These functions are described identically as those members of the same name in the `ctype` class template (22.4.1.1.1).

#### 22.4.1.4   Class template `codecvt` [locale.codecvt]

```

namespace std {
    class codecvt_base {
    public:
        enum result { ok, partial, error, noconv };
    };

    template <class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
    public:
        typedef internT  intern_type;
        typedef externT  extern_type;
        typedef stateT  state_type;

        explicit codecvt(size_t refs = 0);

        result out(stateT& state,
                   const internT* from, const internT* from_end, const internT*& from_next,
                   externT* to,         externT* to_end, externT*& to_next) const;
        result unshift(stateT& state,
                       externT* to,         externT* to_end, externT*& to_next) const;
        result in(stateT& state,
                  const externT* from, const externT* from_end, const externT*& from_next,
                  internT* to,         internT* to_end, internT*& to_next) const;
        int encoding() const noexcept;
        bool always_noconv() const noexcept;
        int length(stateT&, const externT* from, const externT* end,
                   size_t max) const;
        int max_length() const noexcept;

        static locale::id id;

    protected:
        ~codecvt();
        virtual result do_out(stateT& state,
                              const internT* from, const internT* from_end, const internT*& from_next,
                              externT* to,         externT* to_end, externT*& to_next) const;
        virtual result do_in(stateT& state,
                              const externT* from, const externT* from_end, const externT*& from_next,
                              internT* to,         internT* to_end, internT*& to_next) const;
        virtual result do_unshift(stateT& state,
                                   externT* to,         externT* to_end, externT*& to_next) const;
        virtual int do_encoding() const noexcept;
        virtual bool do_always_noconv() const noexcept;
        virtual int do_length(stateT&, const externT* from,
                               const externT* end, size_t max) const;
        virtual int do_max_length() const noexcept;
    };
}

```

<sup>1</sup> The class `codecvt<internT,externT,stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as Unicode and EUC.

<sup>2</sup> The `stateT` argument selects the pair of character encodings being mapped between.

<sup>3</sup> The specializations required in Table 88 (22.3.1.1.1) convert the implementation-defined native character

set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for narrow and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a user-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

#### 22.4.1.4.1 `codecvt` members

[`locale.codecvt.members`]

```
result out(stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;
1    Returns: do_out(state, from, from_end, from_next, to, to_end, to_next)
```

```
result unshift(stateT& state,
    externT* to, externT* to_end, externT*& to_next) const;
2    Returns: do_unshift(state, to, to_end, to_next)
```

```
result in(stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
3    Returns: do_in(state, from, from_end, from_next, to, to_end, to_next)
```

```
int encoding() const noexcept;
4    Returns: do_encoding()
```

```
bool always_noconv() const noexcept;
5    Returns: do_always_noconv()
```

```
int length(stateT& state, const externT* from, const externT* from_end,
    size_t max) const;
6    Returns: do_length(state, from, from_end, max)
```

```
int max_length() const noexcept;
7    Returns: do_max_length()
```

#### 22.4.1.4.2 `codecvt` virtual functions

[`locale.codecvt.virtuals`]

```
result do_out(stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

result do_in(stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
```

1 *Requires:* (`from <= from_end` && `to <= to_end`) well-defined and true; `state` initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.

2 *Effects:* Translates characters in the source range [`from`, `from_end`), placing the results in sequential positions starting at destination `to`. Converts no more than (`from_end` - `from`) source elements, and stores no more than (`to_end` - `to`) destination elements.

Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If returns `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence [`from`, `from_next`). `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in [`to`, `to_end`).

3 A `codecvt` facet that is used by `basic_filebuf` (27.9) shall have the property that if

```
do_out(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `from != from_end`, then

```
do_out(state, from, from + 1, from_next, to, to_end, to_next)
```

shall also return `ok`, and that if

```
do_in(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `to != to_end`, then

```
do_in(state, from, from_end, from_next, to, to + 1, to_next)
```

shall also return `ok`.<sup>242</sup> [ *Note*: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`. — *end note* ]

4 *Remarks*: Its operations on `state` are unspecified. [ *Note*: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. — *end note* ]

5 *Returns*: An enumeration value, as summarized in Table 90.

Table 90 — `do_in/do_out` result values

| Value                | Meaning                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>ok</code>      | completed the conversion                                                                                               |
| <code>partial</code> | not all source characters converted                                                                                    |
| <code>error</code>   | encountered a character in [ <code>from</code> , <code>from_end</code> ) that it could not convert                     |
| <code>noconv</code>  | <code>internT</code> and <code>externT</code> are the same type, and input sequence is identical to converted sequence |

A return value of `partial`, if (`from_next==from_end`), indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

```
result do_unshift(stateT& state,
externT* to, externT* to_end, externT*& to_next) const;
```

6 *Requires*: (`to <= to_end`) well defined and true; `state` initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.

7 *Effects*: Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.<sup>243</sup> Stores no more than (`to_end-to`) destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.

8 *Returns*: An enumeration value, as summarized in Table 91.

<sup>242</sup>) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: a `codecvt` facet that is used by `basic_filebuf` must be able to translate characters one internal character at a time.

<sup>243</sup>) Typically these will be characters to return the state to `stateT()`

Table 91 — `do_unshift` result values

| Value                | Meaning                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ok</code>      | completed the sequence                                                                                                                    |
| <code>partial</code> | space for more than <code>to_end</code> -to destination elements was needed to terminate a sequence given the value of <code>state</code> |
| <code>error</code>   | an unspecified error has occurred                                                                                                         |
| <code>noconv</code>  | no termination is needed for this <code>state_type</code>                                                                                 |

```
int do_encoding() const noexcept;
```

- 9 *Returns:* -1 if the encoding of the `externT` sequence is state-dependent; else the constant number of `externT` characters needed to produce an internal character; or 0 if this number is not a constant.<sup>244</sup>

```
bool do_always_noconv() const noexcept;
```

- 10 *Returns:* true if `do_in()` and `do_out()` return `noconv` for all valid argument values. `codecvt<char, char, mbstate_t>` returns true.

```
int do_length(stateT& state, const externT* from, const externT* from_end,
              size_t max) const;
```

- 11 *Requires:* (`from`≤`from_end`) well-defined and true; `state` initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.
- 12 *Effects:* The effect on the `state` argument is “as if” it called `do_in(state, from, from_end, from, to, to+max, to)` for `to` pointing to a buffer of at least `max` elements.
- 13 *Returns:* (`from_next`-`from`) where `from_next` is the largest value in the range [`from`,`from_end`] such that the sequence of values in the range [`from`, `from_next`) represents `max` or fewer valid complete characters of type `internT`. The specialization `codecvt<char, char, mbstate_t>`, returns the lesser of `max` and (`from_end`-`from`).

```
int do_max_length() const noexcept;
```

- 14 *Returns:* The maximum value that `do_length(state, from, from_end, 1)` can return for any valid range [`from`, `from_end`) and `stateT` value `state`. The specialization `codecvt<char, char, mbstate_t>::do_max_length()` returns 1.

#### 22.4.1.5 Class template `codecvt_byname`

[`locale.codecvt.byname`]

```
namespace std {
    template <class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
    public:
        explicit codecvt_byname(const char*, size_t refs = 0);
        explicit codecvt_byname(const string&, size_t refs = 0);
    protected:
        ~codecvt_byname();
    };
}
```

<sup>244</sup> If `encoding()` yields -1, then more than `max_length()` `externT` elements may be consumed when producing a single `internT` character, and additional `externT` elements may appear at the end of a sequence after those that yield the final `internT` character.

## 22.4.2 The numeric category [category.numeric]

- <sup>1</sup> The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.<sup>245</sup>
- <sup>2</sup> All specifications of member functions for `num_put` and `num_get` in the subclauses of 22.4.2 only apply to the specializations required in Tables 88 and 89 (22.3.1.1.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (22.4), and to its imbued locale for the `num_punct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.
- <sup>3</sup> Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (27.7.2.2.1, 27.7.3.6.1).

### 22.4.2.1 Class template `num_get` [locale.num.get]

```
namespace std {
    template <class charT, class InputIterator = istreambuf_iterator<charT> >
    class num_get : public locale::facet {
    public:
        typedef charT          char_type;
        typedef InputIterator   iter_type;

        explicit num_get(size_t refs = 0);

        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, bool& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, long& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, long long& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, unsigned short& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, unsigned int& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, unsigned long& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, unsigned long long& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, float& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, double& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, long double& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
                     ios_base::iostate& err, void*& v) const;

        static locale::id id;

    protected:
        ~num_get();
    };
}
```

<sup>245</sup>) Parsing "-1" correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

```

virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, bool& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, long long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, unsigned short& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, unsigned int& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, unsigned long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, unsigned long long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, float& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, long double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
                        ios_base::iostate& err, void*& v) const;
};
}

```

- <sup>1</sup> The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

#### 22.4.2.1.1 `num_get` members

[facet.num.get.members]

```

iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
             ios_base::iostate& err, void*& val) const;

```

- <sup>1</sup> *Returns:* `do_get(in, end, str, err, val)`.

#### 22.4.2.1.2 `num_get` virtual functions

[facet.num.get.virtuals]

```

iter_type do_get(iter_type in, iter_type end, ios_base& str,

```

```

    ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, void*& val) const;

```

1 *Effects:* Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet< numput<charT>>(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages

(2.1) — Stage 1: Determine a conversion specifier

(2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.

(2.3) — Stage 3: Store results

3 The details of the stages are presented below.

**Stage 1:** The function initializes local variables via

```

fmtflags flags = str .flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);

```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 92. The table is ordered. That is, the first line whose condition is true applies.

Table 92 — Integer conversions

| State                         | stdio equivalent |
|-------------------------------|------------------|
| <code>basefield == oct</code> | <code>%o</code>  |
| <code>basefield == hex</code> | <code>%X</code>  |
| <code>basefield == 0</code>   | <code>%i</code>  |
| signed integral type          | <code>%d</code>  |
| unsigned integral type        | <code>%u</code>  |

For conversions to a floating type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 93.

**Stage 2:** If `in==end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

Table 93 — Length modifier

| Type               | Length modifier |
|--------------------|-----------------|
| short              | h               |
| unsigned short     | h               |
| long               | l               |
| unsigned long      | l               |
| long long          | ll              |
| unsigned long long | ll              |
| double             | l               |
| long double        | L               |

```

char_type ct = *in ;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<num_punct<charT>>(loc).decimal_point())
c = '.';
bool discard =
    ct == use_facet<num_punct<charT>>(loc).thousands_sep()
    && use_facet<num_punct<charT>>(loc).grouping().length() != 0;

```

where the values `src` and `atoms` are defined as if by:

```

static const char src[] = "0123456789abcdefxABCDEFX+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);

```

for this value of `loc`.

If `discard` is true, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

**Stage 3:** The sequence of `chars` accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>`:

- (3.1) — For a signed integer value, the function `strtoll`.
- (3.2) — For an unsigned integer value, the function `strtoull`.
- (3.3) — For a `float` value, the function `strtof`.
- (3.4) — For a `double` value, the function `strtod`.
- (3.5) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

- (3.6) — zero, if the conversion function fails to convert the entire field.
- (3.7) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.
- (3.8) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.
- (3.9) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function fails to convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

4 Digit grouping is checked. That is, the positions of discarded separators is examined for consistency with `use_facet<num_punct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

5 In any case, if stage 2 processing was terminated by the test for `in==end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                ios_base::iostate& err, bool& val) const;
```

6 *Effects:* If `(str.flags() & ios_base::boolalpha) == 0` then input proceeds as it would for a long except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is 1 then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined “as if” by calling the members `false_name()` and `true_name()` of the facet obtained by `use_facet<num_punct<charT>>(str.getloc())`. Successive characters in the range `[in, end)` (see 23.2.3) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit | str.eofbit)` if the reason for the failure was that `(in == end)`. [*Example:* For targets `true: "a"` and `false: "abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the `'c'` element. For targets `true: "1"` and `false: "0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets (`""`), any input sequence yields `err == str.failbit`. — *end example*]

9 *Returns:* `in`.

#### 22.4.2.2 Class template `num_put`

[`locale.nm.put`]

```
namespace std {
    template <class charT, class OutputIterator = ostreambuf_iterator<charT> >
    class num_put : public locale::facet {
    public:
        typedef charT          char_type;
        typedef OutputIterator  iter_type;

        explicit num_put(size_t refs = 0);

        iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill,
                      unsigned long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill,
                      unsigned long long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill,
                      double v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill,
```

```

        long double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill,
        const void* v) const;

    static locale::id id;

protected:
    ~num_put();
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        bool v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        unsigned long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        unsigned long long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        long double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill,
        const void* v) const;
};
}

```

- <sup>1</sup> The facet `num_put` is used to format numeric values to a character sequence such as an ostream.

#### 22.4.2.2.1 `num_put` members

[facet.num.put.members]

```

iter_type put(iter_type out, ios_base& str, char_type fill,
    bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill,
    const void* val) const;

```

- <sup>1</sup> *Returns:* `do_put(out, str, fill, val)`.

#### 22.4.2.2.2 `num_put` virtual functions

[facet.num.put.virtuals]

```

iter_type do_put(iter_type out, ios_base& str, char_type fill,
    long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill,
    long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill,

```

```

    unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill,
    unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill,
    double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill,
    long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill,
    const void* val) const;

```

1 *Effects:* Writes characters to the sequence `out`, formatting `val` as desired. In the following description, a local variable initialized with:

```
    locale loc = str.getloc();
```

2 The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier `spec` and determining the characters that would be printed by `printf` (27.11) given this conversion specifier for

```
    printf(spec, val )
```

assuming that the current locale is the "C" locale.

(2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet< numpunct<charT> >(str.getloc())`

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns:* `out`.

5

**Stage 1:** The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```

fmtflags flags = str.flags() ;
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));

```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 94.

Table 94 — Integer conversions

| State                                                           | stdio equivalent |
|-----------------------------------------------------------------|------------------|
| <code>basefield == ios_base::oct</code>                         | <code>%o</code>  |
| <code>(basefield == ios_base::hex) &amp;&amp; !uppercase</code> | <code>%x</code>  |
| <code>(basefield == ios_base::hex)</code>                       | <code>%X</code>  |
| for a signed integral type                                      | <code>%d</code>  |
| for an unsigned integral type                                   | <code>%u</code>  |

Table 95 — Floating-point conversions

| State                                                                                     | stdio equivalent |
|-------------------------------------------------------------------------------------------|------------------|
| <code>floatfield == ios_base::fixed</code>                                                | <code>%f</code>  |
| <code>floatfield == ios_base::scientific &amp;&amp; !uppercase</code>                     | <code>%e</code>  |
| <code>floatfield == ios_base::scientific</code>                                           | <code>%E</code>  |
| <code>floatfield == (ios_base::fixed   ios_base::scientific) &amp;&amp; !uppercase</code> | <code>%a</code>  |
| <code>floatfield == (ios_base::fixed   ios_base::scientific)</code>                       | <code>%A</code>  |
| <code>!uppercase</code>                                                                   | <code>%g</code>  |
| <i>otherwise</i>                                                                          | <code>%G</code>  |

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 95.

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 96.

Table 96 — Length modifier

| Type                            | Length modifier |
|---------------------------------|-----------------|
| <code>long</code>               | <code>l</code>  |
| <code>long long</code>          | <code>ll</code> |
| <code>unsigned long</code>      | <code>l</code>  |
| <code>unsigned long long</code> | <code>ll</code> |
| <code>long double</code>        | <code>L</code>  |
| <i>otherwise</i>                | <i>none</i>     |

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 97.

Table 97 — Numeric conversions

| Type(s)               | State                              | stdio equivalent |
|-----------------------|------------------------------------|------------------|
| an integral type      | <code>flags &amp; showpos</code>   | <code>+</code>   |
|                       | <code>flags &amp; showbase</code>  | <code>#</code>   |
| a floating-point type | <code>flags &amp; showpos</code>   | <code>+</code>   |
|                       | <code>flags &amp; showpoint</code> | <code>#</code>   |

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

**Stage 2:** Any character `c` other than a decimal point(`.`) is converted to a `charT` via `use_facet<ctype<charT>> >(loc).widen( c )`

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet< numpunct<charT> >(str.getloc());
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 22.4.3.1.2

Decimal point characters(`.`) are replaced by `punct.decimal_point()`

**Stage 3:** A local variable is initialized as

```
fmtflags adjustfield= (flags & (ios_base::adjustfield));
```

The location of any padding<sup>246</sup> is determined according to Table 98.

Table 98 — Fill padding

| State                                                                                     | Location           |
|-------------------------------------------------------------------------------------------|--------------------|
| <code>adjustfield == ios_base::left</code>                                                | pad after          |
| <code>adjustfield == ios_base::right</code>                                               | pad before         |
| <code>adjustfield == internal</code> and a sign occurs in the representation              | pad after the sign |
| <code>adjustfield == internal</code> and representation after stage 1 began with 0x or 0X | pad after x or X   |
| <i>otherwise</i>                                                                          | pad before         |

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

**Stage 4:** The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

```
iter_type do_put(iter_type out, ios_base& str, char_type fill,
                bool val) const;
```

6 *Returns:* If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
    val ? use_facet<num_punct<charT>>(loc).truename()
        : use_facet<num_punct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

### 22.4.3 The numeric punctuation facet

[facet.numpunct]

#### 22.4.3.1 Class template `num_punct`

[locale.numpunct]

```
namespace std {
    template <class charT>
    class num_punct : public locale::facet {
    public:
        typedef charT          char_type;
        typedef basic_string<charT> string_type;

        explicit num_punct(size_t refs = 0);

        char_type    decimal_point()    const;
        char_type    thousands_sep()    const;
        string        grouping()         const;
        string_type   truename()         const;
```

246) The conversion specification `#o` generates a leading 0 which is *not* a padding character.

```

    string_type falsename()      const;

    static locale::id id;

protected:
    ~numpunct();                // virtual
    virtual char_type do_decimal_point() const;
    virtual char_type do_thousands_sep() const;
    virtual string do_grouping() const;
    virtual string_type do_truename() const;    // for bool
    virtual string_type do_falsename() const;   // for bool
};
}

```

- <sup>1</sup> `numpunct<>` specifies numeric punctuation. The specializations required in Table 88 (22.3.1.1.1), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to `widen`.
- <sup>2</sup> The syntax for number formats is as follows, where `digit` represents the radix set specified by the `fmtflags` argument value, and `thousands-sep` and `decimal-point` are the results of corresponding `numpunct<charT>` members. Integer values have the format:

```

integer    ::= [sign] units
sign       ::= plusminus
plusminus  ::= '+' | '-'
units      ::= digits [thousands-sep units]
digits     ::= digit [digits]

```

and floating-point values have:

```

floatval ::= [sign] units [decimal-point [digits]] [e [sign] digits] |
            [sign] decimal-point digits [e [sign] digits]
e         ::= 'e' | 'E'

```

where the number of digits between `thousands-seps` is as specified by `do_grouping()`. For parsing, if the `digits` portion contains no thousands-separators, no grouping constraint is applied.

#### 22.4.3.1.1 `numpunct` members [facet.numpunct.members]

```
char_type decimal_point() const;
```

- <sup>1</sup> *Returns:* `do_decimal_point()`

```
char_type thousands_sep() const;
```

- <sup>2</sup> *Returns:* `do_thousands_sep()`

```
string grouping() const;
```

- <sup>3</sup> *Returns:* `do_grouping()`

```
string_type truename() const;
```

```
string_type falsename() const;
```

- <sup>4</sup> *Returns:* `do_truename()` or `do_falsename()`, respectively.

**22.4.3.1.2 numpunct virtual functions****[facet.numpunct.virtuals]**

```
char_type do_decimal_point() const;
```

- 1 *Returns:* A character for use as the decimal radix separator. The required specializations return `'.'` or `L'.'`.

```
char_type do_thousands_sep() const;
```

- 2 *Returns:* A character for use as the digit group separator. The required specializations return `'.'` or `L'.'`.

```
string do_grouping() const;
```

- 3 *Returns:* A `basic_string<char>` `vec` used as a vector of integer values, in which each element `vec[i]` represents the number of digits<sup>247</sup> in the group at position `i`, starting with position 0 as the rightmost group. If `vec.size() <= i`, the number is the same as group `(i-1)`; if `(i<0 || vec[i]<=0 || vec[i]==CHAR_MAX)`, the size of the digit group is unlimited.
- 4 The required specializations return the empty string, indicating no grouping.

```
string_type do_truename() const;
```

```
string_type do_falsename() const;
```

- 5 *Returns:* A string representing the name of the boolean value `true` or `false`, respectively.
- 6 In the base class implementation these names are `"true"` and `"false"`, or `L"true"` and `L"false"`.

**22.4.3.2 Class template numpunct\_byname****[locale.numpunct.byname]**

```
namespace std {
    template <class charT>
    class numpunct_byname : public numpunct<charT> {
        // this class is specialized for char and wchar_t.
    public:
        typedef charT          char_type;
        typedef basic_string<charT> string_type;
        explicit numpunct_byname(const char*, size_t refs = 0);
        explicit numpunct_byname(const string&, size_t refs = 0);
    protected:
        ~numpunct_byname();
    };
}
```

**22.4.4 The collate category****[category.collate]****22.4.4.1 Class template collate****[locale.collate]**

```
namespace std {
    template <class charT>
    class collate : public locale::facet {
    public:
        typedef charT          char_type;
        typedef basic_string<charT> string_type;

        explicit collate(size_t refs = 0);
```

<sup>247</sup>) Thus, the string `"\003"` specifies groups of 3 digits each, and `"3"` probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of `"3"`.

```

    int compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;
    string_type transform(const charT* low, const charT* high) const;
    long hash(const charT* low, const charT* high) const;

    static locale::id id;

protected:
    ~collate();
    virtual int do_compare(const charT* low1, const charT* high1,
                        const charT* low2, const charT* high2) const;
    virtual string_type do_transform(const charT* low, const charT* high) const;
    virtual long do_hash (const charT* low, const charT* high) const;
};
}

```

- <sup>1</sup> The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 25) and containers operating on strings. The specializations required in Table 88 (22.3.1.1.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographic ordering (25.5.9).

- <sup>2</sup> Each function compares a string of characters `*p` in the range `[low, high)`.

#### 22.4.4.1.1 collate members

[locale.collate.members]

```

int compare(const charT* low1, const charT* high1,
           const charT* low2, const charT* high2) const;

```

- <sup>1</sup> *Returns:* `do_compare(low1, high1, low2, high2)`

```

string_type transform(const charT* low, const charT* high) const;

```

- <sup>2</sup> *Returns:* `do_transform(low, high)`

```

long hash(const charT* low, const charT* high) const;

```

- <sup>3</sup> *Returns:* `do_hash(low, high)`

#### 22.4.4.1.2 collate virtual functions

[locale.collate.virtuals]

```

int do_compare(const charT* low1, const charT* high1,
              const charT* low2, const charT* high2) const;

```

- <sup>1</sup> *Returns:* 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 88 (22.3.1.1.1), namely `collate<char>` and `collate<wchar_t>`, implement a lexicographical comparison (25.5.9).

```

string_type do_transform(const charT* low, const charT* high) const;

```

- <sup>2</sup> *Returns:* A `basic_string<charT>` value that, compared lexicographically with the result of calling `transform()` on another string, yields the same result as calling `do_compare()` on the same two strings.<sup>248</sup>

```

long do_hash(const charT* low, const charT* high) const;

```

---

248) This function is useful when one string is being compared to many other strings.

- <sup>3</sup> *Returns:* An integer value equal to the result of calling `hash()` on any other string for which `do_compare()` returns 0 (equal) when passed the two strings. [ *Note:* The probability that the result equals that for another string which does not compare equal should be very small, approaching  $(1.0/\text{numeric\_limits}<\text{unsigned long}>::\text{max}())$ . — *end note* ]

#### 22.4.4.2 Class template `collate_byname`

[`locale.collate.byname`]

```
namespace std {
    template <class charT>
    class collate_byname : public collate<charT> {
    public:
        typedef basic_string<charT> string_type;
        explicit collate_byname(const char*, size_t refs = 0);
        explicit collate_byname(const string&, size_t refs = 0);
    protected:
        ~collate_byname();
    };
}
```

#### 22.4.5 The time category

[`category.time`]

- <sup>1</sup> Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 22.4.5 only apply to the specializations required in Tables 88 and 89 (22.3.1.1.1). Their members use their `ios_base&`, `ios_base::iostate&`, and fill arguments as described in (22.4), and the `ctype<>` facet, to determine formatting details.

##### 22.4.5.1 Class template `time_get`

[`locale.time.get`]

```
namespace std {
    class time_base {
    public:
        enum dateorder { no_order, dmy, mdy, ymd, ydm };
    };

    template <class charT, class InputIterator = istreambuf_iterator<charT> >
    class time_get : public locale::facet, public time_base {
    public:
        typedef charT          char_type;
        typedef InputIterator   iter_type;

        explicit time_get(size_t refs = 0);

        dateorder date_order() const { return do_date_order(); }
        iter_type get_time(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
        iter_type get_date(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
        iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                              ios_base::iostate& err, tm* t) const;
        iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                               ios_base::iostate& err, tm* t) const;
        iter_type get_year(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
        iter_type get(iter_type s, iter_type end, ios_base& f,
                      ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
        iter_type get(iter_type s, iter_type end, ios_base& f,
```

```

        ios_base::iostate& err, tm* t, const char_type* fmt,
        const char_type* fmtend) const;

    static locale::id id;

protected:
    ~time_get();
    virtual dateorder do_date_order() const;
    virtual iter_type do_get_time(iter_type s, iter_type end, ios_base&,
        ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_date(iter_type s, iter_type end, ios_base&,
        ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base&,
        ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base&,
        ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_year(iter_type s, iter_type end, ios_base&,
        ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
        ios_base::iostate& err, tm* t, char format, char modifier) const;
};
}

```

<sup>1</sup> `time_get` is used to parse a character sequence, extracting components of a time or date into a `struct tm` record. Each `get` member parses a format as produced by a corresponding format specifier to `time_put<>::put`. If the sequence being parsed matches the correct format, the corresponding members of the `struct tm` argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.<sup>249</sup>

<sup>2</sup> If the end iterator is reached during parsing by any of the `get()` member functions, the member sets `ios_base::eofbit` in `err`.

#### 22.4.5.1.1 `time_get` members

[`locale.time.get.members`]

```
dateorder date_order() const;
```

<sup>1</sup> *Returns:* `do_date_order()`

```
iter_type get_time(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
```

<sup>2</sup> *Returns:* `do_get_time(s, end, str, err, t)`

```
iter_type get_date(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
```

<sup>3</sup> *Returns:* `do_get_date(s, end, str, err, t)`

```
iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
```

<sup>4</sup> *Returns:* `do_get_weekday(s, end, str, err, t)` or `do_get_monthname(s, end, str, err, t)`

<sup>249</sup>) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

```
iter_type get_year(iter_type s, iter_type end, ios_base& str,
                  ios_base::iostate& err, tm* t) const;
```

5     *Returns:* `do_get_year(s, end, str, err, t)`

```
iter_type get(iter_type s, iter_type end, ios_base& f,
             ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
```

6     *Returns:* `do_get(s, end, f, err, t, format, modifier)`

```
iter_type get(iter_type s, iter_type end, ios_base& f,
             ios_base::iostate& err, tm* t, const char_type* fmt, const char_type* fmtend) const;
```

7     *Requires:* `[fmt, fmtend)` shall be a valid range.

8     *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

- (8.1)     — The expression `fmt == fmtend` evaluates to true.
- (8.2)     — The expression `err == ios_base::goodbit` evaluates to false.
- (8.3)     — The expression `s == end` evaluates to true, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.
- (8.4)     — The next element of `fmt` is equal to `'%'`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the ISO/IEC 9945 function `strptime`. If the number of elements in the range `[fmt, fmtend)` is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.
- (8.5)     — The expression `isspace(*fmt, f.getloc())` evaluates to true, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to true, then advances `s` until `s == end || !isspace(*s, f.getloc())` is true, and finally resumes looping.
- (8.6)     — The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

9     [*Note:* The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — *end note*]

10    *Returns:* `s`

#### 22.4.5.1.2 time\_get virtual functions

[`locale.time.get.virtuals`]

```
dateorder do_date_order() const;
```

1     *Returns:* An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.<sup>250</sup> Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
                    ios_base::iostate& err, tm* t) const;
```

250) This function is intended as a convenience only, for common formats, and may return `no_order` in valid locales.

2 *Effects:* Reads characters starting at **s** until it has extracted those **struct tm** members, and remaining format characters, used by **time\_put<>::put** to produce the format specified by "%H:%M:%S", or until it encounters an error or end of sequence.

3 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
                    ios_base::iostate& err, tm* t) const;
```

4 *Effects:* Reads characters starting at **s** until it has extracted those **struct tm** members and remaining format characters used by **time\_put<>::put** to produce one of the following formats, or until it encounters an error. The format depends on the value returned by **date\_order()** as shown in Table 99.

Table 99 — **do\_get\_date** effects

| <b>date_order()</b> | <b>Format</b> |
|---------------------|---------------|
| <b>no_order</b>     | "%m%d%y"      |
| <b>dmy</b>          | "%d%m%y"      |
| <b>mdy</b>          | "%m%d%y"      |
| <b>ymd</b>          | "%y%m%d"      |
| <b>ydm</b>          | "%y%d%m"      |

5 An implementation may also accept additional implementation-defined formats.

6 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
                          ios_base::iostate& err, tm* t) const;
```

7 *Effects:* Reads characters starting at **s** until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that could match a full name, it continues reading until it matches the full name or fails. It sets the appropriate **struct tm** member accordingly.

8 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                    ios_base::iostate& err, tm* t) const;
```

9 *Effects:* Reads characters starting at **s** until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the **t->tm\_year** member accordingly.

10 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                ios_base::iostate& err, tm* t, char format, char modifier) const;
```

11 *Requires:* **t** shall point to an object.

12 *Effects:* The function starts by evaluating **err = ios\_base::goodbit**. It then reads characters starting at **s** until it encounters an error, or until it has extracted and assigned those **struct tm** members, and any remaining format characters, corresponding to a conversion directive appropriate for the ISO/IEC

9945 function `strptime`, formed by concatenating `'%'`, the modifier character, when non-NUL, and the format character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to true after reading a character the function evaluates `err |= ios_base::eofbit`.

13 For complex conversion directives such as `%c`, `%x`, or `%X`, or directives that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `struct tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `struct tm` members are unspecified and may be outside their valid range.

14 *Remark:* It is unspecified whether multiple calls to `do_get()` with the address of the same `struct tm` object will update the current contents of the object or simply overwrite its members. Portable programs must zero out the object before invoking the function.

15 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given format and modifier.

#### 22.4.5.2 Class template `time_get_byname`

[`locale.time.get.byname`]

```
namespace std {
    template <class charT, class InputIterator = istreambuf_iterator<charT> >
    class time_get_byname : public time_get<charT, InputIterator> {
    public:
        typedef time_base::dateorder dateorder;
        typedef InputIterator        iter_type;

        explicit time_get_byname(const char*, size_t refs = 0);
        explicit time_get_byname(const string&, size_t refs = 0);
    protected:
        ~time_get_byname();
    };
}
```

#### 22.4.5.3 Class template `time_put`

[`locale.time.put`]

```
namespace std {
    template <class charT, class OutputIterator = ostreambuf_iterator<charT> >
    class time_put : public locale::facet {
    public:
        typedef charT        char_type;
        typedef OutputIterator iter_type;

        explicit time_put(size_t refs = 0);

        // the following is implemented in terms of other member functions.
        iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                     const charT* pattern, const charT* pat_end) const;
        iter_type put(iter_type s, ios_base& f, char_type fill,
                     const tm* tmb, char format, char modifier = 0) const;

        static locale::id id;

    protected:
        ~time_put();
        virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                                char format, char modifier) const;
    };
}
```

22.4.5.3.1 `time_put` members

[locale.time.put.members]

```

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              char format, char modifier = 0) const;

```

- 1 *Effects:* The first form steps through the sequence from `pattern` to `pat_end`, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to `s` immediately, and each format sequence, as it is identified, results in a call to `do_put`; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character `c` to a `char` value as if by `ct.narrow(c,0)`, where `ct` is a reference to `ctype<charT>` obtained from `str.getloc()`. The first character of each sequence is equal to `'%'`, followed by an optional modifier character `mod`<sup>251</sup> and a format specifier character `spec` as defined for the function `strftime`. If no modifier character is present, `mod` is zero. For each valid format sequence identified, calls `do_put(s, str, fill, t, spec, mod)`.
- 2 The second form calls `do_put(s, str, fill, t, format, modifier)`.
- 3 [ *Note:* The `fill` argument may be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note* ]
- 4 *Returns:* An iterator pointing immediately after the last character produced.

22.4.5.3.2 `time_put` virtual functions

[locale.time.put.virtuals]

```

iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                 char format, char modifier) const;

```

- 1 *Effects:* Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`<sup>252</sup>, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.<sup>253</sup>
- 2 *Returns:* An iterator pointing immediately after the last character produced. [ *Note:* The `fill` argument may be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note* ]

22.4.5.4 Class template `time_put_byname`

[locale.time.put.byname]

```

namespace std {
    template <class charT, class OutputIterator = ostreambuf_iterator<charT> >
    class time_put_byname : public time_put<charT, OutputIterator>
    {
    public:
        typedef charT          char_type;
        typedef OutputIterator iter_type;

        explicit time_put_byname(const char*, size_t refs = 0);
        explicit time_put_byname(const string&, size_t refs = 0);
    protected:
        ~time_put_byname();
    };
}

```

251) Although the C programming language defines no modifiers, most vendors do.

252) Interpretation of the `modifier` argument is implementation-defined, but should follow POSIX conventions.

253) Implementations are encouraged to refer to other standards such as POSIX for these definitions.

## 22.4.6 The monetary category [category.monetary]

- <sup>1</sup> These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.
- <sup>2</sup> All specifications of member functions for `money_put` and `money_get` in the subclauses of 22.4.6 only apply to the specializations required in Tables 88 and 89 (22.3.1.1.1). Their members use their `ios_base&`, `ios_base::iostate&`, and fill arguments as described in (22.4), and the `money_punct<>` and `ctype<>` facets, to determine formatting details.

### 22.4.6.1 Class template `money_get` [locale.money.get]

```
namespace std {
    template <class charT,
        class InputIterator = istreambuf_iterator<charT> >
    class money_get : public locale::facet {
    public:
        typedef charT          char_type;
        typedef InputIterator   iter_type;
        typedef basic_string<charT> string_type;

        explicit money_get(size_t refs = 0);

        iter_type get(iter_type s, iter_type end, bool intl,
            ios_base& f, ios_base::iostate& err,
            long double& units) const;
        iter_type get(iter_type s, iter_type end, bool intl,
            ios_base& f, ios_base::iostate& err,
            string_type& digits) const;

        static locale::id id;

    protected:
        ~money_get();
        virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
            ios_base::iostate& err, long double& units) const;
        virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
            ios_base::iostate& err, string_type& digits) const;
    };
}
```

#### 22.4.6.1.1 `money_get` members [locale.money.get.members]

```
iter_type get(iter_type s, iter_type end, bool intl,
    ios_base& f, ios_base::iostate& err,
    long double& quant) const;
iter_type get(s, iter_type end, bool intl, ios_base&f,
    ios_base::iostate& err, string_type& quant) const;
```

- <sup>1</sup> *Returns:* `do_get(s, end, intl, f, err, quant)`

#### 22.4.6.1.2 `money_get` virtual functions [locale.money.get.virtuals]

```
iter_type do_get(iter_type s, iter_type end, bool intl,
    ios_base& str, ios_base::iostate& err,
    long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl,
    ios_base& str, ios_base::iostate& err,
```

```
string_type& digits) const;
```

- 1 *Effects:* Reads characters from `s` to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to `(err|str.failbit)`, or `(err|str.failbit|str.eofbit)` if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is `'-'` or in the range from `'0'` through `'9'`, inclusive) stored in `digits`. [*Example:* The sequence `$1,056.23` in a common United States locale would yield, for `units`, `105623`, or, for `digits`, `"105623"`. — *end example*] If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.
- 2 Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no white space is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one white space character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, white space is allowed but not required. If `(str.flags() & str.showbase)` is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.
- 3 If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components. [*Example:* If `showbase` is off, then for a `neg` value of `"()`" and a currency symbol of `"L"`, in `"(100 L)"` the `"L"` is consumed; but if `neg` is `"-"`, the `"L"` in `"-100 L"` is not consumed. — *end example*] If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.
- 4 Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by<sup>254</sup>

```
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

- 5 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

---

<sup>254</sup>) The semantics here are different from `ct.narrow`.

## 22.4.6.2 Class template money\_put

[locale.money.put]

```

namespace std {
    template <class charT,
              class OutputIterator = ostreambuf_iterator<charT> >
    class money_put : public locale::facet {
    public:
        typedef charT          char_type;
        typedef OutputIterator iter_type;
        typedef basic_string<charT> string_type;

        explicit money_put(size_t refs = 0);

        iter_type put(iter_type s, bool intl, ios_base& f,
                     char_type fill, long double units) const;
        iter_type put(iter_type s, bool intl, ios_base& f,
                     char_type fill, const string_type& digits) const;

        static locale::id id;

    protected:
        ~money_put();
        virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                                long double units) const;
        virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                                const string_type& digits) const;
    };
}

```

## 22.4.6.2.1 money\_put members

[locale.money.put.members]

```

iter_type put(iter_type s, bool intl, ios_base& f, char_type fill,
              long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill,
              const string_type& quant) const;

```

<sup>1</sup> *Returns:* do\_put(s, intl, f, loc, quant)

## 22.4.6.2.2 money\_put virtual functions

[locale.money.put.virtuals]

```

iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, const string_type& digits) const;

```

<sup>1</sup> *Effects:* Writes characters to s according to the format specified by a `moneypunct<charT,Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('‑')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit

characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

- <sup>2</sup> *Remarks:* The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters. [*Note:* It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`. — *end note*]
- <sup>3</sup> *Returns:* An iterator pointing immediately after the last character produced.

### 22.4.6.3 Class template `moneypunct`

[`locale.moneypunct`]

```
namespace std {
    class money_base {
    public:
        enum part { none, space, symbol, sign, value };
        struct pattern { char field[4]; };
    };

    template <class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
    public:
        typedef charT char_type;
        typedef basic_string<charT> string_type;

        explicit moneypunct(size_t refs = 0);

        charT      decimal_point() const;
        charT      thousands_sep() const;
        string      grouping()      const;
        string_type curr_symbol()   const;
        string_type positive_sign() const;
        string_type negative_sign() const;
        int         frac_digits()   const;
        pattern     pos_format()     const;
        pattern     neg_format()     const;

        static locale::id id;
        static const bool intl = International;

    protected:
        ~moneypunct();
        virtual charT      do_decimal_point() const;
        virtual charT      do_thousands_sep() const;
        virtual string      do_grouping()      const;
        virtual string_type do_curr_symbol()   const;
        virtual string_type do_positive_sign() const;
        virtual string_type do_negative_sign() const;
        virtual int         do_frac_digits()   const;
        virtual pattern     do_pos_format()     const;
        virtual pattern     do_neg_format()     const;
    };
}
```

```

}

```

- <sup>1</sup> The `money_punct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the *i*th component of the format<sup>255</sup>. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.
- <sup>2</sup> Where `none` or `space` appears, white space is permitted in the format, except where `none` appears at the end, in which case no white space is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.
- <sup>3</sup> The format of the numeric monetary value is a decimal number:

```

value ::= units [ decimal-point [ digits ] ] |
        decimal-point digits

```

if `frac_digits()` returns a positive value, or

```

value ::= units

```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```

units ::= digits [ thousands-sep units ]
digits ::= adigit [ digits ]

```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9', inclusive, and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. White space characters are those characters `c` for which `ci.is(space,c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

- <sup>4</sup> The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `num_punct<>::do_grouping()`.

#### 22.4.6.3.1 money\_punct members

[`locale.money_punct.members`]

```

charT      decimal_point() const;
charT      thousands_sep() const;
string     grouping()      const;
string_type curr_symbol()  const;
string_type positive_sign() const;
string_type negative_sign() const;
int        frac_digits()   const;
pattern    pos_format()    const;
pattern    neg_format()    const;

```

- <sup>1</sup> Each of these functions *F* returns the result of calling the corresponding virtual member function `do_F()`.

#### 22.4.6.3.2 money\_punct virtual functions

[`locale.money_punct.virtuals`]

<sup>255</sup>) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

```
charT do_decimal_point() const;
```

<sup>1</sup> *Returns:* The radix separator to use in case `do_frac_digits()` is greater than zero.<sup>256</sup>

```
charT do_thousands_sep() const;
```

<sup>2</sup> *Returns:* The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.<sup>257</sup>

```
string do_grouping() const;
```

<sup>3</sup> *Returns:* A pattern defined identically as, but not necessarily equal to, the result of `numpunct<charT>::do_grouping()`.<sup>258</sup>

```
string_type do_curr_symbol() const;
```

<sup>4</sup> *Returns:* A string to use as the currency identifier symbol.<sup>259</sup>

```
string_type do_positive_sign() const;
```

```
string_type do_negative_sign() const;
```

<sup>5</sup> *Returns:* `do_positive_sign()` returns the string to use to indicate a positive monetary value;<sup>260</sup> `do_negative_sign()` returns the string to use to indicate a negative value.

```
int do_frac_digits() const;
```

<sup>6</sup> *Returns:* The number of digits after the decimal radix separator, if any.<sup>261</sup>

```
pattern do_pos_format() const;
```

```
pattern do_neg_format() const;
```

<sup>7</sup> *Returns:* The specializations required in Table 89 (22.3.1.1.1), namely `moneypunct<char>`, `moneypunct<wchar_t>`, `moneypunct<char,true>`, and `moneypunct<wchar_t,true>`, return an object of type `pattern` initialized to { symbol, sign, none, value }.<sup>262</sup>

#### 22.4.6.4 Class template `moneypunct_byname`

[`locale.moneypunct.byname`]

```
namespace std {
    template <class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
    public:
        typedef money_base::pattern pattern;
        typedef basic_string<charT> string_type;

        explicit moneypunct_byname(const char*, size_t refs = 0);
        explicit moneypunct_byname(const string&, size_t refs = 0);
    protected:
        ~moneypunct_byname();
    };
}
```

#### 22.4.7 The message retrieval category

[`category.messages`]

<sup>1</sup> Class `messages<charT>` implements retrieval of strings from message catalogs.

<sup>256</sup>) In common U.S. locales this is `'.'`.

<sup>257</sup>) In common U.S. locales this is `' '`.

<sup>258</sup>) To specify grouping by 3s, the value is `"\003"` *not* `"3"`.

<sup>259</sup>) For international specializations (second template parameter `true`) this is typically four characters long, usually three letters and a space.

<sup>260</sup>) This is usually the empty string.

<sup>261</sup>) In common U.S. locales, this is 2.

<sup>262</sup>) Note that the international symbol returned by `do_curr_sym()` usually contains a space, itself; for example, `"USD "`.

**22.4.7.1 Class template messages**

[locale.messages]

```

namespace std {
    class messages_base {
    public:
        typedef unspecified signed integer type catalog;
    };

    template <class charT>
    class messages : public locale::facet, public messages_base {
    public:
        typedef charT char_type;
        typedef basic_string<charT> string_type;

        explicit messages(size_t refs = 0);

        catalog open(const basic_string<char>& fn, const locale&) const;
        string_type get(catalog c, int set, int msgid,
                       const string_type& ddefault) const;
        void close(catalog c) const;

        static locale::id id;

    protected:
        ~messages();
        virtual catalog do_open(const basic_string<char>&, const locale&) const;
        virtual string_type do_get(catalog, int set, int msgid,
                                   const string_type& ddefault) const;
        virtual void do_close(catalog) const;
    };
}

```

- <sup>1</sup> Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

**22.4.7.1.1 messages members**

[locale.messages.members]

```
catalog open(const basic_string<char>& name, const locale& loc) const;
```

- <sup>1</sup> *Returns:* `do_open(name, loc)`.

```
string_type get(catalog cat, int set, int msgid,
               const string_type& ddefault) const;
```

- <sup>2</sup> *Returns:* `do_get(cat, set, msgid, ddefault)`.

```
void close(catalog cat) const;
```

- <sup>3</sup> *Effects:* Calls `do_close(cat)`.

**22.4.7.1.2 messages virtual functions**

[locale.messages.virtuals]

```
catalog do_open(const basic_string<char>& name,
               const locale& loc) const;
```

- <sup>1</sup> *Returns:* A value that may be passed to `get()` to retrieve a message from the message catalog identified by the string `name` according to an implementation-defined mapping. The result can be used until it is passed to `close()`.
- <sup>2</sup> Returns a value less than 0 if no such catalog can be opened.

- 3     *Remarks:* The locale argument `loc` is used for character set code conversion when retrieving messages, if needed.

```
string_type do_get(catalog cat, int set, int msgid,
                  const string_type& default) const;
```

- 4     *Requires:* `cat` shall be a catalog obtained from `open()` and not yet closed.
- 5     *Returns:* A message identified by arguments `set`, `msgid`, and `default`, according to an implementation-defined mapping. If no such message can be found, returns `default`.

```
void do_close(catalog cat) const;
```

- 6     *Requires:* `cat` shall be a catalog obtained from `open()` and not yet closed.
- 7     *Effects:* Releases unspecified resources associated with `cat`.
- 8     *Remarks:* The limit on such resources, if any, is implementation-defined.

#### 22.4.7.2 Class template `messages_byname` [locale.messages.byname]

```
namespace std {
    template <class charT>
    class messages_byname : public messages<charT> {
    public:
        typedef messages_base::catalog catalog;
        typedef basic_string<charT>    string_type;

        explicit messages_byname(const char*, size_t refs = 0);
        explicit messages_byname(const string&, size_t refs = 0);
    protected:
        ~messages_byname();
    };
}
```

#### 22.4.8 Program-defined facets [facets.examples]

- 1 A C++ program may define facets to be added to a locale and used identically as the built-in facets. To create a new facet interface, C++ programs simply derive from `locale::facet` a class containing a static member: `static locale::id id`.
- 2 [ *Note:* The locale member function templates verify its type and storage class. — *end note* ]
- 3 [ *Example:* Traditional global localization is still easy:

```
#include <iostream>
#include <locale>
int main(int argc, char** argv) {
    using namespace std;
    locale::global(locale(""));           // set the global locale
                                          // imbue it on all the std streams

    cin.imbue(locale());
    cout.imbue(locale());
    cerr.imbue(locale());
    wcin.imbue(locale());
    wcout.imbue(locale());
    wcerr.imbue(locale());

    return MyObject(argc, argv).doit();
}
```

— *end example*]

- <sup>4</sup> [*Example:* Greater flexibility is possible:

```
#include <iostream>
#include <locale>
int main() {
    using namespace std;
    cin.imbue(locale(""));           // the user's preferred locale
    cout.imbue(locale::classic());
    double f;
    while (cin >> f) cout << f << endl;
    return (cin.fail() != 0);
}
```

In a European locale, with input 3.456,78, output is 3456.78. — *end example*]

- <sup>5</sup> This can be important even for simple programs, which may need to write a data file in a fixed format, regardless of a user's preference.
- <sup>6</sup> [*Example:* Here is an example of the use of locales in a library interface.

```
// file: Date.h
#include <iosfwd>
#include <string>
#include <locale>

class Date {
public:
    Date(unsigned day, unsigned month, unsigned year);
    std::string asString(const std::locale& = std::locale());
};

std::istream& operator>>(std::istream& s, Date& d);
std::ostream& operator<<(std::ostream& s, Date d);
```

- <sup>7</sup> This example illustrates two architectural uses of class `locale`.
- <sup>8</sup> The first is as a default argument in `Date::asString()`, where the default is the global (presumably user-preferred) locale.
- <sup>9</sup> The second is in the operators `<<` and `>>`, where a locale “hitchhikes” on another object, in this case a stream, to the point where it is needed.

```
// file: Date.C
#include "Date"           // includes <ctime>
#include <sstream>
std::string Date::asString(const std::locale& l) {
    using namespace std;
    ostringstream s; s.imbue(l);
    s << *this; return s.str();
}

std::istream& operator>>(std::istream& s, Date& d) {
    using namespace std;
    istream::sentry cerberos(s);
    if (cerberos) {
        ios_base::iostate err = goodbit;
        struct tm t;
```

```

    use_facet< time_get<char> >(s.getloc()).get_date(s, 0, s, err, &t);
    if (!err) d = Date(t.tm_day, t.tm_mon + 1, t.tm_year + 1900);
    s.setstate(err);
}
return s;
}

```

— *end example*]

- <sup>10</sup> A locale object may be extended with a new facet simply by constructing it with an instance of a class derived from `locale::facet`. The only member a C++ program must define is the static member `id`, which identifies your class interface as a new facet.

- <sup>11</sup> [*Example*: Classifying Japanese characters:

```

// file: <jctype>
#include <locale>
namespace My {
    using namespace std;
    class JCTYPE : public locale::facet {
    public:
        static locale::id id;           // required for use as a new locale facet
        bool is_kanji (wchar_t c) const;
        JCTYPE() { }
    protected:
        ~JCTYPE() { }
    };
}

// file: filt.C
#include <iostream>
#include <locale>
#include "jctype"           // above
std::locale::id My::JCTYPE::id; // the static JCTYPE member declared above.

int main() {
    using namespace std;
    typedef ctype<wchar_t> wctype;
    locale loc(locale(""),           // the user's preferred locale ...
               new My::JCTYPE);      // and a new feature ...
    wchar_t c = use_facet<wctype>(loc).widen('!');
    if (!use_facet<My::JCTYPE>(loc).is_kanji(c))
        cout << "no it isn't!" << endl;
    return 0;
}

```

- <sup>12</sup> The new facet is used exactly like the built-in facets. — *end example*]

- <sup>13</sup> [*Example*: Replacing an existing facet is even easier. The code does not define a member `id` because it is reusing the `numput<charT>` facet interface:

```

// file: my_bool.C
#include <iostream>
#include <locale>
#include <string>
namespace My {
    using namespace std;
    typedef numput_byname<char> cnumput;

```

```

class BoolNames : public cnumpunct {
protected:
    string do_truename() const { return "Oui Oui!"; }
    string do_falsename() const { return "Mais Non!"; }
    ~BoolNames() { }
public:
    BoolNames(const char* name) : cnumpunct(name) { }
};
}

int main(int argc, char** argv) {
    using namespace std;
    // make the user's preferred locale, except for...
    locale loc(locale(""), new My::BoolNames(""));
    cout.imbue(loc);
    cout << boolalpha << "Any arguments today? " << (argc > 1) << endl;
    return 0;
}

```

— *end example*]

## 22.5 Standard code conversion facets

[`locale.stdcv`]

<sup>1</sup> The header `<codecvt>` provides code conversion facets for various character encodings.

<sup>2</sup> **Header `<codecvt>` synopsis**

```

namespace std {
    enum codecvt_mode {
        consume_header = 4,
        generate_header = 2,
        little_endian = 1
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff,
            codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8
    : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8(size_t refs = 0);
        ~codecvt_utf8();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff,
            codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf16
    : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf16(size_t refs = 0);
        ~codecvt_utf16();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff,
            codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8_utf16
    : public codecvt<Elem, char, mbstate_t> {
    public:

```

```

        explicit codecvt_utf8_utf16(size_t refs = 0);
        ~codecvt_utf8_utf16();
    };
}

```

<sup>3</sup> For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

- (3.1) — **Elem** is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.
- (3.2) — **Maxcode** is the largest wide-character code that the facet will read or write without reporting a conversion error.
- (3.3) — If (**Mode** & **consume\_header**), the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
- (3.4) — If (**Mode** & **generate\_header**), the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.
- (3.5) — If (**Mode** & **little\_endian**), the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.

<sup>4</sup> For the facet `codecvt_utf8`:

- (4.1) — The facet shall convert between UTF-8 multibyte sequences and UCS2 or UCS4 (depending on the size of **Elem**) within the program.
- (4.2) — Endianness shall not affect how multibyte sequences are read or written.
- (4.3) — The multibyte sequences may be written as either a text or a binary file.

<sup>5</sup> For the facet `codecvt_utf16`:

- (5.1) — The facet shall convert between UTF-16 multibyte sequences and UCS2 or UCS4 (depending on the size of **Elem**) within the program.
- (5.2) — Multibyte sequences shall be read or written according to the **Mode** flag, as set out above.
- (5.3) — The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.

<sup>6</sup> For the facet `codecvt_utf8_utf16`:

- (6.1) — The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.
- (6.2) — Endianness shall not affect how multibyte sequences are read or written.
- (6.3) — The multibyte sequences may be written as either a text or a binary file.

## 22.6 C library locales

[c.locales]

<sup>1</sup> Table 100 describes header `<locale>`.

<sup>2</sup> The contents are the same as the Standard C library header `<locale.h>`.

<sup>3</sup> Calls to the function `setlocale` may introduce a data race (17.6.5.9) with other calls to `setlocale` or with calls to the functions listed in Table 101.

SEE ALSO: ISO C Clause 7.4.

Table 100 — Header `<locale>` synopsis

| Type              | Name(s)     |            |          |
|-------------------|-------------|------------|----------|
| <b>Macros:</b>    | LC_ALL      | LC_COLLATE | LC_CTYPE |
|                   | LC_MONETARY | LC_NUMERIC | LC_TIME  |
|                   | NULL        |            |          |
| <b>Struct:</b>    | lconv       |            |          |
| <b>Functions:</b> | localeconv  | setlocale  |          |

Table 101 — Potential `setlocale` data races

|         |          |           |            |          |
|---------|----------|-----------|------------|----------|
| fprintf | isprint  | iswdigit  | localeconv | tolower  |
| fscanf  | ispunct  | iswgraph  | mblen      | toupper  |

| isdigit | iswblank | iswupper  | strerror   | wcstombs |
| isgraph | iswcntrl | iswxdigit | strtod     | wcsxfrm  |
| islower | iswctype | isxdigit  | strxfrm    | wctomb   |

## 23 Containers library

[containers]

### 23.1 General

[containers.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to organize collections of information.
- <sup>2</sup> The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 102.

Table 102 — Containers library summary

| Subclause                                             | Header(s)                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">23.2</a> Requirements                     |                                                                                                                                                           |
| <a href="#">23.3</a> Sequence containers              | <code>&lt;array&gt;</code><br><code>&lt;deque&gt;</code><br><code>&lt;forward_list&gt;</code><br><code>&lt;list&gt;</code><br><code>&lt;vector&gt;</code> |
| <a href="#">23.4</a> Associative containers           | <code>&lt;map&gt;</code><br><code>&lt;set&gt;</code>                                                                                                      |
| <a href="#">23.5</a> Unordered associative containers | <code>&lt;unordered_map&gt;</code><br><code>&lt;unordered_set&gt;</code>                                                                                  |
| <a href="#">23.6</a> Container adaptors               | <code>&lt;queue&gt;</code><br><code>&lt;stack&gt;</code>                                                                                                  |

### 23.2 Container requirements

[container.requirements]

#### 23.2.1 General container requirements

[container.requirements.general]

- <sup>1</sup> Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.
- <sup>2</sup> All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects. [*Example:* The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — *end example*]
- <sup>3</sup> For the components affected by this subclause that declare an `allocator_type`, objects stored in these components shall be constructed using the `allocator_traits<allocator_type>::rebind_traits<U>::construct` function and destroyed using the `allocator_traits<allocator_type>::rebind_traits<U>::destroy` function (20.9.8.2), where `U` is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container's element type, not for internal types used by the container. [*Note:* This means, for example, that a node-based container might need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — *end note*]
- <sup>4</sup> In Tables 103, 104, and 105 `X` denotes a container class containing objects of type `T`, `a` and `b` denote values of type `X`, `u` denotes an identifier, `r` denotes a non-const value of type `X`, and `rv` denotes a non-const rvalue of type `X`.

Table 103 — Container requirements

| Expression                                    | Return type                                  | Operational semantics                                                            | Assertion/note pre-/post-condition                                                                                  | Complexity   |
|-----------------------------------------------|----------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|--------------|
| <code>X::value_type</code>                    | T                                            |                                                                                  | <i>Requires:</i> T is <b>Erasable</b> from X (see 23.2.1, below)                                                    | compile time |
| <code>X::reference</code>                     | T&                                           |                                                                                  |                                                                                                                     | compile time |
| <code>X::const_reference</code>               | const T&                                     |                                                                                  |                                                                                                                     | compile time |
| <code>X::iterator</code>                      | iterator type whose value type is T          |                                                                                  | any iterator category that meets the forward iterator requirements. convertible to <code>X::const_iterator</code> . | compile time |
| <code>X::const_iterator</code>                | constant iterator type whose value type is T |                                                                                  | any iterator category that meets the forward iterator requirements.                                                 | compile time |
| <code>X::difference_type</code>               | signed integer type                          |                                                                                  | is identical to the difference type of <code>X::iterator</code> and <code>X::const_iterator</code>                  | compile time |
| <code>X::size_type</code>                     | unsigned integer type                        |                                                                                  | <code>size_type</code> can represent any non-negative value of <code>difference_type</code>                         | compile time |
| <code>X u;</code>                             |                                              |                                                                                  | post: <code>u.empty()</code>                                                                                        | constant     |
| <code>X()</code>                              |                                              |                                                                                  | post: <code>X().empty()</code>                                                                                      | constant     |
| <code>X(a)</code>                             |                                              |                                                                                  | <i>Requires:</i> T is <b>CopyInsertable</b> into X (see below).<br>post: <code>a == X(a)</code> .                   | linear       |

Notes: the algorithm `equal()` is defined in Clause 25. Those entries marked “(Note A)” or “(Note B)” have linear complexity for `array` and have constant complexity for all other standard containers.

- <sup>5</sup> The member function `size()` returns the number of elements in the container. The number of elements is defined by the rules of constructors, inserts, and erases.
- <sup>6</sup> `begin()` returns an iterator referring to the first element in the container. `end()` returns an iterator which is the past-the-end value for the container. If the container is empty, then `begin() == end()`;
- <sup>7</sup> In the expressions

```

i == j
i != j
i < j
i <= j
i >= j
i > j
i - j

```

where `i` and `j` denote objects of a container's `iterator` type, either or both may be replaced by an object of the container's `const_iterator` type referring to the same element with no change in semantics.

- 8 Unless otherwise specified, all containers defined in this clause obtain memory using an allocator (see 17.6.3.5). Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument. [Note: If an invocation of a constructor uses the default value of an optional allocator argument, then the `Allocator` type must support value initialization. — end note] A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if `allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value`, `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value`, or `allocator_traits<allocator_type>::propagate_on_container_swap::value` is true within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.
- 9 The expression `a.swap(b)`, for containers `a` and `b` of a standard container type other than `array`, shall exchange the values of `a` and `b` without invoking any move, copy, or swap operations on the individual container elements. Lvalues of any `Compare`, `Pred`, or `Hash` types belonging to `a` and `b` shall be swappable and shall be exchanged by calling `swap` as described in 17.6.3.2. If `allocator_traits<allocator_type>::propagate_on_container_swap::value` is true, then lvalues of type `allocator_type` shall be swappable and the allocators of `a` and `b` shall also be exchanged by calling `swap` as described in 17.6.3.2. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless `a.get_allocator() == b.get_allocator()`. Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.
- 10 If the iterator type of a container belongs to the bidirectional or random access iterator categories (24.2), the container is called *reversible* and satisfies the additional requirements in Table 104.

| <code>a.crbegin()</code> | <code>const_reverse_iterator</code>                                                                   | <code>const_cast&lt;X<br/>const&amp;&gt;(a).rbegin()</code> | constant   |
| <code>a.crend()</code>   | <code>const_reverse_iterator</code>                                                                   | <code>const_cast&lt;X<br/>const&amp;&gt;(a).rend()</code>   | constant   |

- <sup>11</sup> Unless otherwise specified (see 23.2.4.1, 23.2.5.1, 23.3.8.4, and 23.3.11.5) all container types defined in this Clause meet the following additional requirements:
- (11.1) — if an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.
  - (11.2) — if an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.
  - (11.3) — no `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.
  - (11.4) — no copy constructor or assignment operator of a returned iterator throws an exception.
  - (11.5) — no `swap()` function throws an exception.
  - (11.6) — no `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped. [*Note: The `end()` iterator does not refer to any element, so it may be invalidated. — end note*]
- <sup>12</sup> Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.
- <sup>13</sup> A *contiguous container* is a container that supports random access iterators (24.2.7) and whose member types `iterator` and `const_iterator` are contiguous iterators (24.2.1).
- <sup>14</sup> Table 105 lists operations that are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics described in Table 105 unless otherwise stated.

Table 105 — Optional container operations

| Expression             | Return type                      | Operational semantics                                                        | Assertion/note pre-/post-condition                                                                                   | Complexity |
|------------------------|----------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|------------|
| <code>a &lt; b</code>  | convertible to <code>bool</code> | <code>lexicographical_compare(a.begin(), a.end(), b.begin(), b.end())</code> | pre: <code>&lt;</code> is defined for values of <code>T</code> . <code>&lt;</code> is a total ordering relationship. | linear     |
| <code>a &gt; b</code>  | convertible to <code>bool</code> | <code>b &lt; a</code>                                                        |                                                                                                                      | linear     |
| <code>a &lt;= b</code> | convertible to <code>bool</code> | <code>!(a &gt; b)</code>                                                     |                                                                                                                      | linear     |
| <code>a &gt;= b</code> | convertible to <code>bool</code> | <code>!(a &lt; b)</code>                                                     |                                                                                                                      | linear     |

Note: the algorithm `lexicographical_compare()` is defined in Clause 25.

- 15 All of the containers defined in this Clause and in (21.3.1) except `array` meet the additional requirements of an allocator-aware container, as described in Table 106.

Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type (possibly `const`) `T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware, the terms below are defined as if `A` were `std::allocator<T>` — no allocator object needs to be created and user specializations of `std::allocator<T>` are not instantiated:

- (15.1) — `T` is *DefaultInsertable* into `X` means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p)
```

- (15.2) — An element of `X` is *default-inserted* if it is initialized by evaluation of the expression

```
allocator_traits<A>::construct(m, p)
```

where `p` is the address of the uninitialized storage for the element allocated within `X`.

- (15.3) — `T` is *MoveInsertable* into `X` means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, rv)
```

and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation. [*Note: `rv` remains a valid object. Its state is unspecified — end note*]

- (15.4) — `T` is *CopyInsertable* into `X` means that, in addition to `T` being *MoveInsertable* into `X`, the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, v)
```

and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

- (15.5) — `T` is *EmplaceConstructible* into `X` from `args`, for zero or more arguments `args`, means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, args)
```

(15.6) — *T is Erasable from X* means that the following expression is well-formed:

```
allocator_traits<A>::destroy(m, p)
```

[*Note:* A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at `p` using `args`, with `m == get_allocator()`. The default `construct` in `std::allocator` will call `::new((void*)p) T(args)`, but specialized allocators may choose a different definition. — *end note*]

- <sup>16</sup> In Table 106, *X* denotes an allocator-aware container class with a `value_type` of *T* using allocator of type *A*, *u* denotes a variable, *a* and *b* denote non-const lvalues of type *X*, *t* denotes an lvalue or a const rvalue of type *X*, *rv* denotes a non-const rvalue of type *X*, and *m* is a value of type *A*.

Table 106 — Allocator-aware container requirements

| Expression                            | Return type   | Assertion/note<br>pre-/post-condition                                                                                                                                                                                                                                                                                                  | Complexity                                                                          |

### 23.2.2 Container data races

[container.requirements.dataraces]

- For purposes of avoiding data races (17.6.5.9), implementations shall consider the following functions to be `const`: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.
- Notwithstanding (17.6.5.9), implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.
- [*Note:* For a `vector<int> x` with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently may result in a data race. As an exception to the general rule, for a `vector<bool> y`, `y[0] = true` may race with `y[1] = true`. — *end note*]

### 23.2.3 Sequence containers

[sequence.reqmts]

- A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: `vector`, `forward_list`, `list`, and `deque`. In addition, `array` is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as `stacks` or `queues`, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user might define).
- The sequence containers offer the programmer different complexity trade-offs and should be used accordingly. `vector` or `array` is the type of sequence container that should be used by default. `list` or `forward_list` should be used when there are frequent insertions and deletions from the middle of the sequence. `deque` is the data structure of choice when most insertions and deletions take place at the beginning or at the end of the sequence.
- In Tables 107 and 108, `X` denotes a sequence container class, `a` denotes a value of type `X` containing elements of type `T`, `u` denotes the name of a variable being declared, `A` denotes `X::allocator_type` if the *qualified-id* `X::allocator_type` is valid and denotes a type (14.8.2) and `std::allocator<T>` if it doesn't, `i` and `j` denote iterators satisfying input iterator requirements and refer to elements implicitly convertible to `value_type`, `[i, j)` denotes a valid range, `il` designates an object of type `initializer_list<value_type>`, `n` denotes a value of type `X::size_type`, `p` denotes a valid const iterator to `a`, `q` denotes a valid dereferenceable const iterator to `a`, `[q1, q2)` denotes a valid range of const iterators in `a`, `t` denotes an lvalue or a const rvalue of

`X::value_type`, and `rv` denotes a non-const rvalue of `X::value_type`. `Args` denotes a template parameter pack; `args` denotes a function parameter pack with the pattern `Args&&`.

<sup>4</sup> The complexities of the expressions are sequence dependent.

Table 107 — Sequence container requirements (in addition to container)

| Expression                                     | Return type         | Assertion/note<br>pre-/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <code>a.assign(n,t)</code>    | void        | <i>Requires:</i> T shall be <code>CopyInsertable</code> into X and <code>CopyAssignable</code> .<br>pre: t is not a reference into a.<br>Replaces elements in a with n copies of t.                                                                                                                                                                                                                                                          |

<sup>5</sup> `iterator` and `const_iterator` types for sequence containers shall be at least of the forward iterator category.

<sup>6</sup> The iterator returned from `a.insert(p, t)` points to the copy of t inserted into a.

<sup>7</sup> The iterator returned from `a.insert(p, rv)` points to the copy of rv inserted into a.

<sup>8</sup> The iterator returned from `a.insert(p, n, t)` points to the copy of the first element inserted into a, or p if n == 0.

- 9 The iterator returned from `a.insert(p, i, j)` points to the copy of the first element inserted into `a`, or `p` if `i == j`.
- 10 The iterator returned from `a.insert(p, il)` points to the copy of the first element inserted into `a`, or `p` if `il` is empty.
- 11 The iterator returned from `a.emplace(p, args)` points to the new element constructed from `args` into `a`.
- 12 The iterator returned from `a.erase(q)` points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.
- 13 The iterator returned by `a.erase(q1,q2)` points to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.
- 14 For every sequence container defined in this Clause and in Clause 21:
- (14.1) — If the constructor
- ```
template <class InputIterator>
X(InputIterator first, InputIterator last,
  const allocator_type& alloc = allocator_type())
```
- is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.
- (14.2) — If the member functions of the forms:
- ```
template <class InputIterator>           // such as insert()
  rt fx1(const_iterator p, InputIterator first, InputIterator last);

template <class InputIterator>           // such as append(), assign()
  rt fx2(InputIterator first, InputIterator last);

template <class InputIterator>           // such as replace()
  rt fx3(const_iterator i1, const_iterator i2, InputIterator first, InputIterator last);
```
- are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.
- 15 The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators.
- 16 Table 108 lists operations that are provided for some types of sequence containers but not others. An implementation shall provide these operations for all container types shown in the “container” column, and shall implement them so as to take amortized constant time.

Table 108 — Optional sequence container operations

| Expression             | Return type                                               | Operational semantics                                                                    | Container                                                                                                                                          |

<sup>17</sup> The member function `at()` provides bounds-checked access to container elements. `at()` throws `out_of_range` if `n >= a.size()`.

### 23.2.4 Associative containers

[associative.reqmts]

<sup>1</sup> Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: `set`, `multiset`, `map` and `multimap`.

- 2 Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering (25.5) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary *mapped type* `T` with the `Key`. The object of type `Compare` is called the *comparison object* of a container.
- 3 The phrase “equivalence of keys” means the equivalence relation imposed by the comparison and *not* the `operator==` on keys. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`. For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.
- 4 An associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.
- 5 For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.
- 6 `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type. [ *Note:* `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — *end note* ]
- 7 The associative containers meet all the requirements of Allocator-aware containers (23.2.1), except that for `map` and `multimap`, the requirements placed on `value_type` in Table 103 apply instead to `key_type` and `mapped_type`. [ *Note:* For example, in some cases `key_type` and `mapped_type` are required to be `CopyAssignable` even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not `CopyAssignable`. — *end note* ]
- 8 In Table 109, `X` denotes an associative container class, `a` denotes a value of type `X`, `u` denotes the name of a variable being declared, `a_uniq` denotes a value of type `X` when `X` supports unique keys, `a_eq` denotes a value of type `X` when `X` supports multiple keys, `a_tran` denotes a value of type `X` when the *qualified-id* `X::key_compare::is_transparent` is valid and denotes a type (14.8.2), `i` and `j` satisfy input iterator requirements and refer to elements implicitly convertible to `value_type`, `[i, j)` denotes a valid range, `p` denotes a valid const iterator to `a`, `q` denotes a valid dereferenceable const iterator to `a`, `r` denotes a valid dereferenceable iterator to `a`, `[q1, q2)` denotes a valid range of const iterators in `a`, `il` designates an object of type `initializer_list<value_type>`, `t` denotes a value of type `X::value_type`, `k` denotes a value of type `X::key_type` and `c` denotes a value of type `X::key_compare`; `k1` is a value such that `a` is partitioned (25.5) with respect to `c(r, k1)`, with `r` the key value of `e` and `e` in `a`; `ku` is a value such that `a` is partitioned with respect to `!c(ku, r)`; `ke` is a value such that `a` is partitioned with respect to `c(r, ke)` and `!c(ke, r)`, with `c(r, ke)` implying `!c(ke, r)`. `A` denotes the storage allocator used by `X`, if any, or `std::allocator<X::value_type>` otherwise, and `m` denotes an allocator of a type convertible to `A`.

Table 109 — Associative container requirements (in addition to container)

| Expression                                                                           | Return type      | Assertion/note<br>pre-/post-condition | Complexity   |
|--------------------------------------------------------------------------------------|------------------|---------------------------------------|--------------|
| <code>X::key_type</code>                                                             | <code>Key</code> |                                       | compile time |
| <code>mapped_type</code><br>( <code>map</code> and<br><code>multimap</code><br>only) | <code>T</code>   |                                       | compile time |

Always returns the iterator pointing to the element with key equivalent to the key of <code>t</code> . <code>t</code> is inserted as close as possible to the position just prior to <code>p</code> . | logarithmic in general, but amortized constant if <code>t</code> is inserted right before <code>p</code> . |
| <code>a.insert(i, j)</code> | void        | <i>Requires:</i> <code>value_type</code> shall be <code>EmplaceConstructible</code> into <code>X</code> from <code>*i</code> .<br>pre: <code>i, j</code> are not iterators into <code>a</code> . inserts each element from the range <code>[i, j)</code> if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.                                                                                                                                                                                                                                                  | $N \log(a.size() + N)$ ( $N$ has the value <code>distance(i, j)</code> )                                   |
| <code>a.insert(il)</code>   | void        | Equivalent to <code>a.insert(il.begin(), il.end())</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                            |
| <code>a.erase(k)</code>     | size_type   | erases all elements in the container with key equivalent to <code>k</code> . returns the number of erased elements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | $\log(a.size()) + a.count(k)$                                                                              |
| <code>a.erase(q)</code>     | iterator    | erases the element pointed to by <code>q</code> . Returns an iterator pointing to the element immediately following <code>q</code> prior to the element being erased. If no such element exists, returns <code>a.end()</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                             | amortized constant                                                                                         |

Table 109 — Associative container requirements (in addition to container) (continued)

| Expression                          | Return type                                                    | Assertion/note<br>pre-/post-condition                                                                                                                                                                                                   | Complexity                                                                   |
|-------------------------------------|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| <code>a.erase(r)</code>             | iterator                                                       | erases the element pointed to by <code>r</code> . Returns an iterator pointing to the element immediately following <code>r</code> prior to the element being erased. If no such element exists, returns <code>a.end()</code> .         | amortized constant                                                           |
| <code>a.erase(q1, q2)</code>        | iterator                                                       | erases all the elements in the range <code>[q1, q2)</code> . Returns an iterator pointing to the element pointed to by <code>q2</code> prior to any elements being erased. If no such element exists, <code>a.end()</code> is returned. | $\log(a.size()) + N$ where $N$ has the value <code>distance(q1, q2)</code> . |
| <code>a.clear()</code>              | void                                                           | <code>a.erase(a.begin(), a.end())</code><br>post: <code>a.empty()</code> returns true                                                                                                                                                   | linear in <code>a.size()</code> .                                            |
| <code>a.find(k)</code>              | iterator;<br>const_iterator for constant <code>a</code> .      | returns an iterator pointing to an element with the key equivalent to <code>k</code> , or <code>a.end()</code> if such an element is not found                                                                                          | logarithmic                                                                  |
| <code>a_tran.find(ke)</code>        | iterator;<br>const_iterator for constant <code>a_tran</code> . | returns an iterator pointing to an element with key <code>r</code> such that <code>!c(r, ke) &amp;&amp; !c(ke, r)</code> , or <code>a_tran.end()</code> if such an element is not found                                                 | logarithmic                                                                  |
| <code>a.count(k)</code>             | size_type                                                      | returns the number of elements with key equivalent to <code>k</code>                                                                                                                                                                    | $\log(a.size()) + a.count(k)$                                                |
| <code>a_tran.count(ke)</code>       | size_type                                                      | returns the number of elements with key <code>r</code> such that <code>!c(r, ke) &amp;&amp; !c(ke, r)</code>                                                                                                                            | $\log(a_tran.size()) + a_tran.count(ke)$                                     |
| <code>a.lower_bound(k)</code>       | iterator;<br>const_iterator for constant <code>a</code> .      | returns an iterator pointing to the first element with key not less than <code>k</code> , or <code>a.end()</code> if such an element is not found.                                                                                      | logarithmic                                                                  |
| <code>a_tran.lower_bound(k1)</code> | iterator;<br>const_iterator for constant <code>a_tran</code> . | returns an iterator pointing to the first element with key <code>r</code> such that <code>!c(r, k1)</code> , or <code>a_tran.end()</code> if such an element is not found.                                                              | logarithmic                                                                  |
| <code>a.upper_bound(k)</code>       | iterator;<br>const_iterator for constant <code>a</code> .      | returns an iterator pointing to the first element with key greater than <code>k</code> , or <code>a.end()</code> if such an element is not found.                                                                                       | logarithmic                                                                  |

Table 109 — Associative container requirements (in addition to container) (continued)

| Expression                                    | Return type                                                                                                                                           | Assertion/note<br>pre-/post-condition                                                                                                                                                 | Complexity  |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <code>a_tran.<br/>upper_<br/>bound(ku)</code> | iterator;<br>const_<br>iterator for<br>constant<br><code>a_tran.</code>                                                                               | returns an iterator pointing to<br>the first element with key <code>r</code><br>such that <code>c(ku, r)</code> , or<br><code>a_tran.end()</code> if such an<br>element is not found. | logarithmic |
| <code>a.equal_<br/>range(k)</code>            | <code>pair&lt;iterator,<br/>iterator&gt;;<br/>pair&lt;const_<br/>iterator,<br/>const_<br/>iterator&gt;</code> for<br>constant <code>a</code> .        | equivalent to <code>make_<br/>pair(a.lower_bound(k),<br/>a.upper_bound(k))</code> .                                                                                                   | logarithmic |
| <code>a_tran.<br/>equal_<br/>range(ke)</code> | <code>pair&lt;iterator,<br/>iterator&gt;;<br/>pair&lt;const_<br/>iterator,<br/>const_<br/>iterator&gt;</code> for<br>constant<br><code>a_tran.</code> | equivalent to <code>make_pair(<br/>a_tran.lower_bound(ke),<br/>a_tran.upper_bound(ke))</code> .                                                                                       | logarithmic |

- <sup>9</sup> The `insert` and `emplace` members shall not affect the validity of iterators and references to the container, and the `erase` members shall invalidate only iterators and references to the erased elements.
- <sup>10</sup> The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators `i` and `j` such that distance from `i` to `j` is positive,
- ```
value_comp(*j, *i) == false
```
- <sup>11</sup> For associative containers with unique keys the stronger condition holds,
- ```
value_comp(*i, *j) != false.
```
- <sup>12</sup> When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, either through a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.
- <sup>13</sup> The member function templates `find`, `count`, `lower_bound`, `upper_bound`, and `equal_range` shall not participate in overload resolution unless the *qualified-id* `Compare::is_transparent` is valid and denotes a type (14.8.2).

#### 23.2.4.1 Exception safety guarantees

[associative.reqmts.except]

- <sup>1</sup> For associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Compare` object (if any).

- <sup>2</sup> For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- <sup>3</sup> For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Compare` object (if any).

### 23.2.5 Unordered associative containers

[unord.req]

- <sup>1</sup> Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.
- <sup>2</sup> Unordered associative containers conform to the requirements for Containers (23.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.
- <sup>3</sup> Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the `Hash` requirements (17.6.3.4) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary *mapped type* `T` with the `Key`.
- <sup>4</sup> The container's object of type `Hash` — denoted by `hash` — is called the *hash function* of the container. The container's object of type `Pred` — denoted by `pred` — is called the *key equality predicate* of the container.
- <sup>5</sup> Two values `k1` and `k2` of type `Key` are considered equivalent if the container's key equality predicate returns `true` when passed those values. If `k1` and `k2` are equivalent, the container's hash function shall return the same value for both. [ *Note:* Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. — *end note* ] For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.
- <sup>6</sup> An unordered associative container supports *unique keys* if it may contain at most one element for each key. Otherwise, it supports *equivalent keys*. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into *equivalent-key groups* such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.
- <sup>7</sup> For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `std::pair<const Key, T>`.
- <sup>8</sup> For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type. [ *Note:* `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — *end note* ]
- <sup>9</sup> The elements of an unordered associative container are organized into *buckets*. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For `unordered_multiset` and `unordered_multimap`, rehashing preserves the relative ordering of equivalent elements.
- <sup>10</sup> The unordered associative containers meet all the requirements of Allocator-aware containers (23.2.1), except that for `unordered_map` and `unordered_multimap`, the requirements placed on `value_type` in Table 103

apply instead to `key_type` and `mapped_type`. [ *Note:* For example, `key_type` and `mapped_type` are sometimes required to be `CopyAssignable` even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not `CopyAssignable`. — *end note* ]

- <sup>11</sup> In Table 110: `X` denotes an unordered associative container class, `a` denotes a value of type `X`, `b` denotes a possibly const value of type `X`, `a_uniq` denotes a value of type `X` when `X` supports unique keys, `a_eq` denotes a value of type `X` when `X` supports equivalent keys, `i` and `j` denote input iterators that refer to `value_type`, `[i, j)` denotes a valid range, `p` and `q2` denote valid const iterators to `a`, `q` and `q1` denote valid dereferenceable const iterators to `a`, `r` denotes a valid dereferenceable iterator to `a`, `[q1, q2)` denotes a valid range in `a`, `il` denotes a value of type `initializer_list<value_type>`, `t` denotes a value of type `X::value_type`, `k` denotes a value of type `key_type`, `hf` denotes a possibly const value of type `hasher`, `eq` denotes a possibly const value of type `key_equal`, `n` denotes a value of type `size_type`, and `z` denotes a value of type `float`.

Table 110 — Unordered associative container requirements (in addition to container)

| Expression                                                                                            | Return type                                                                                                                                      | Assertion/note pre-/post-condition                                                                                                              | Complexity   |
|-------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| <code>X::key_type</code>                                                                              | Key                                                                                                                                              |                                                                                                                                                 | compile time |
| <code>X::mapped_type</code><br>( <code>unordered_map</code> and <code>unordered_multimap</code> only) | T                                                                                                                                                |                                                                                                                                                 | compile time |
| <code>X::value_type</code><br>( <code>unordered_set</code> and <code>unordered_multiset</code> only)  | Key                                                                                                                                              | <i>Requires:</i> <code>value_type</code> is Erasable from <code>X</code>                                                                        | compile time |
| <code>X::value_type</code><br>( <code>unordered_map</code> and <code>unordered_multimap</code> only)  | <code>pair&lt;const Key, T&gt;</code>                                                                                                            | <i>Requires:</i> <code>value_type</code> is Erasable from <code>X</code>                                                                        | compile time |
| <code>X::hasher</code>                                                                                | Hash                                                                                                                                             | <code>Hash</code> shall be a unary function object type such that the expression <code>hf(k)</code> has type <code>std::size_t</code> .         | compile time |
| <code>X::key_equal</code>                                                                             | Pred                                                                                                                                             | <code>Pred</code> shall be a binary predicate that takes two arguments of type <code>Key</code> . <code>Pred</code> is an equivalence relation. | compile time |
| <code>X::local_iterator</code>                                                                        | An iterator type whose category, value type, difference type, and pointer and reference types are the same as <code>X::iterator</code> 's.       | A <code>local_iterator</code> object may be used to iterate through a single bucket, but may not be used to iterate across buckets.             | compile time |
| <code>X::const_local_iterator</code>                                                                  | An iterator type whose category, value type, difference type, and pointer and reference types are the same as <code>X::const_iterator</code> 's. | A <code>const_local_iterator</code> object may be used to iterate through a single bucket, but may not be used to iterate across buckets.       | compile time |

| <code>b.end(n)</code>             | local_iterator;<br>const_local_iterator for<br>const b.                                 | Pre: <code>n</code> shall be in the range $[0, b.bucket\_count())$ . <code>b.end(n)</code> returns an iterator which is the past-the-end value for the bucket.                                                                                                  | Constant                                                                               |

Table 110 — Unordered associative container requirements (in addition to container) (continued)

| Expression                  | Return type          | Assertion/note pre-/post-condition                                                                                                                                                                                       | Complexity                                                       |
|-----------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| <b>b.cbegin(n)</b>          | const_local_iterator | Pre: <b>n</b> shall be in the range $[0, \text{b.bucket\_count}())$ . Note: $[\text{b.cbegin}(\text{n}), \text{b.cend}(\text{n}))$ is a valid range containing all of the elements in the $\text{n}^{\text{th}}$ bucket. | Constant                                                         |
| <b>b.cend(n)</b>            | const_local_iterator | Pre: <b>n</b> shall be in the range $[0, \text{b.bucket\_count}())$ .                                                                                                                                                    | Constant                                                         |
| <b>b.load_factor()</b>      | float                | Returns the average number of elements per bucket.                                                                                                                                                                       | Constant                                                         |
| <b>b.max_load_factor()</b>  | float                | Returns a positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number. | Constant                                                         |
| <b>a.max_load_factor(z)</b> | void                 | Pre: <b>z</b> shall be positive. May change the container's maximum load factor, using <b>z</b> as a hint.                                                                                                               | Constant                                                         |
| <b>a.rehash(n)</b>          | void                 | Post: $\text{a.bucket\_count}() \geq \text{a.size}() / \text{a.max\_load\_factor}()$ and $\text{a.bucket\_count}() \geq \text{n}$ .                                                                                      | Average case linear in $\text{a.size}()$ , worst case quadratic. |
| <b>a.reserve(n)</b>         | void                 | Same as $\text{a.rehash}(\text{ceil}(\text{n} / \text{a.max\_load\_factor}()))$ .                                                                                                                                        | Average case linear in $\text{a.size}()$ , worst case quadratic. |

- <sup>12</sup> Two unordered containers **a** and **b** compare equal if  $\text{a.size}() == \text{b.size}()$  and, for every equivalent-key group  $[\text{Ea1}, \text{Ea2}]$  obtained from  $\text{a.equal\_range}(\text{Ea1})$ , there exists an equivalent-key group  $[\text{Eb1}, \text{Eb2}]$  obtained from  $\text{b.equal\_range}(\text{Ea1})$ , such that  $\text{is\_permutation}(\text{Ea1}, \text{Ea2}, \text{Eb1}, \text{Eb2})$  returns **true**. For **unordered\_set** and **unordered\_map**, the complexity of **operator==** (i.e., the number of calls to the **==** operator of the **value\_type**, to the predicate returned by **key\_equal()**, and to the hasher returned by **hash\_function()**) is proportional to  $N$  in the average case and to  $N^2$  in the worst case, where  $N$  is  $\text{a.size}()$ . For **unordered\_multiset** and **unordered\_multimap**, the complexity of **operator==** is proportional to  $\sum E_i^2$  in the average case and to  $N^2$  in the worst case, where  $N$  is  $\text{a.size}()$ , and  $E_i$  is the size of the  $i^{\text{th}}$  equivalent-key group in **a**. However, if the respective elements of each corresponding pair of equivalent-key groups  $\text{Ea}_i$  and  $\text{Eb}_i$  are arranged in the same order (as is commonly the case, e.g., if **a** and **b** are unmodified copies of the same container), then the average-case complexity for **unordered\_multiset** and **unordered\_multimap** becomes proportional to  $N$  (but worst-case complexity remains  $\mathcal{O}(N^2)$ , e.g., for a pathologically bad hash function). The behavior of a program that uses **operator==** or **operator!=** on unordered containers is undefined unless the **Hash** and **Pred** function objects respectively have the same behavior for both containers

and the equality comparison operator for `Key` is a refinement<sup>263</sup> of the partition into equivalent-key groups produced by `Pred`.

- 13 The iterator types `iterator` and `const_iterator` of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both `iterator` and `const_iterator` are const iterators.
- 14 The `insert` and `emplace` members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The `erase` members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.
- 15 The `insert` and `emplace` members shall not affect the validity of iterators if  $(N+n) \leq z * B$ , where  $N$  is the number of elements in the container prior to the insert operation,  $n$  is the number of elements inserted,  $B$  is the container's bucket count, and  $z$  is the container's maximum load factor.

### 23.2.5.1 Exception safety guarantees

[unord.req.except]

- 1 For unordered associative containers, no `clear()` function throws an exception. `erase(k)` does not throw an exception unless that exception is thrown by the container's `Hash` or `Pred` object (if any).
- 2 For unordered associative containers, if an exception is thrown by any operation other than the container's hash function from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.
- 3 For unordered associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container's `Hash` or `Pred` object (if any).
- 4 For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container's hash function or comparison function, the `rehash()` function has no effect.

## 23.3 Sequence containers

[sequences]

### 23.3.1 In general

[sequences.general]

- 1 The headers `<array>`, `<deque>`, `<forward_list>`, `<list>`, and `<vector>` define class templates that meet the requirements for sequence containers.

### 23.3.2 Header `<array>` synopsis

[array.syn]

```
#include <initializer_list>

namespace std {
    // 23.3.7, class template array:
    template <class T, size_t N> struct array;
    template <class T, size_t N>
        bool operator==(const array<T, N>& x, const array<T, N>& y);
    template <class T, size_t N>
        bool operator!=(const array<T, N>& x, const array<T, N>& y);
    template <class T, size_t N>
        bool operator< (const array<T, N>& x, const array<T, N>& y);
    template <class T, size_t N>
        bool operator<= (const array<T, N>& x, const array<T, N>& y);
    template <class T, size_t N>
        bool operator> (const array<T, N>& x, const array<T, N>& y);
    template <class T, size_t N>
        bool operator>= (const array<T, N>& x, const array<T, N>& y);
    template <class T, size_t N>
        void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
}
```

263) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.

```

template <class T> class tuple_size;
template <size_t I, class T> class tuple_element;
template <class T, size_t N>
    struct tuple_size<array<T, N>>;
template <size_t I, class T, size_t N>
    struct tuple_element<I, array<T, N>>;
template <size_t I, class T, size_t N>
    constexpr T& get(array<T, N>&) noexcept;
template <size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&&) noexcept;
template <size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>&) noexcept;
template <size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&&) noexcept;
}

```

### 23.3.3 Header <deque> synopsis

[deque.syn]

```

#include <initializer_list>

namespace std {
    // 23.3.8, class template deque:
    template <class T, class Allocator = allocator<T>> class deque;
    template <class T, class Allocator>
        bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator< (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator!=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator> (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator>=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator<=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
    template <class T, class Allocator>
        void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
            noexcept(noexcept(x.swap(y)));

    namespace pmr {
        template <class T>
            using deque = std::deque<T, polymorphic_allocator<T>>;
    }
}

```

### 23.3.4 Header <forward\_list> synopsis

[forward\_list.syn]

```

#include <initializer_list>

namespace std {
    // 23.3.9, class template forward_list:
    template <class T, class Allocator = allocator<T>> class forward_list;
    template <class T, class Allocator>
        bool operator==(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
    template <class T, class Allocator>

```

```

    bool operator< (const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator!=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator> (const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator>=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator<=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

namespace pmr {
    template <class T>
        using forward_list = std::forward_list<T, polymorphic_allocator<T>>;
}
}

```

### 23.3.5 Header <list> synopsis

[list.syn]

```

#include <initializer_list>

namespace std {
    // 23.3.10, class template list:
    template <class T, class Allocator = allocator<T>> class list;
    template <class T, class Allocator>
        bool operator==(const list<T, Allocator>& x, const list<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator< (const list<T, Allocator>& x, const list<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator!=(const list<T, Allocator>& x, const list<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator> (const list<T, Allocator>& x, const list<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator>=(const list<T, Allocator>& x, const list<T, Allocator>& y);
    template <class T, class Allocator>
        bool operator<=(const list<T, Allocator>& x, const list<T, Allocator>& y);
    template <class T, class Allocator>
        void swap(list<T, Allocator>& x, list<T, Allocator>& y)
            noexcept(noexcept(x.swap(y)));

    namespace pmr {
        template <class T>
            using list = std::list<T, polymorphic_allocator<T>>;
    }
}

```

### 23.3.6 Header <vector> synopsis

[vector.syn]

```

#include <initializer_list>

namespace std {
    // 23.3.11, class template vector:
    template <class T, class Allocator = allocator<T>> class vector;
    template <class T, class Allocator>

```

```

    bool operator==(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator< (const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator!=(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator> (const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator>=(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator<=(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

// 23.3.12, class vector<bool>
template <class Allocator> class vector<bool, Allocator>;

// hash support
template <class T> struct hash;
template <class Allocator> struct hash<vector<bool, Allocator>>;

namespace pmr {
    template <class T>
        using vector = std::vector<T, polymorphic_allocator<T>>;
}

```

### 23.3.7 Class template array

[array]

#### 23.3.7.1 Class template array overview

[array.overview]

- <sup>1</sup> The header `<array>` defines a class template for storing fixed-size sequences of objects. An **array** is a contiguous container (23.2.1). An instance of `array<T, N>` stores *N* elements of type *T*, so that `size() == N` is an invariant.
- <sup>2</sup> An **array** is an aggregate (8.5.1) that can be list-initialized with up to *N* elements whose types are convertible to *T*.
- <sup>3</sup> An **array** satisfies all of the requirements of a container and of a reversible container (23.2), except that a default constructed **array** object is not empty and that `swap` does not have constant complexity. An **array** satisfies some of the requirements of a sequence container (23.2.3). Descriptions are provided here only for operations on **array** that are not described in one of these tables and for operations where there is additional semantic information.

```

namespace std {
    template <class T, size_t N>
    struct array {
        // types:
        typedef T&                                reference;
        typedef const T&                          const_reference;
        typedef implementation-defined            iterator;
        typedef implementation-defined            const_iterator;
        typedef size_t                             size_type;
        typedef ptrdiff_t                         difference_type;
        typedef T                                 value_type;
        typedef T*                                pointer;
    };
}

```

```

typedef const T*                const_pointer;
typedef std::reverse_iterator<iterator>    reverse_iterator;
typedef std::reverse_iterator<const_iterator> const_reverse_iterator;

T        elems[N];           // exposition only

// no explicit construct/copy/destroy for aggregate type

void fill(const T& u);
void swap(array&) noexcept(is_nothrow_swappable_v<T>);

// iterators:
constexpr iterator        begin() noexcept;
constexpr const_iterator  begin() const noexcept;
constexpr iterator        end() noexcept;
constexpr const_iterator  end() const noexcept;

constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;

constexpr const_iterator  cbegin() const noexcept;
constexpr const_iterator  cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// capacity:
constexpr bool        empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;

// element access:
constexpr reference    operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr reference    at(size_type n);
constexpr const_reference at(size_type n) const;
constexpr reference    front();
constexpr const_reference front() const;
constexpr reference    back();
constexpr const_reference back() const;

constexpr T *        data() noexcept;
constexpr const T * data() const noexcept;
};
}

```

<sup>4</sup> [Note: The member variable `elems` is shown for exposition only, to emphasize that `array` is a class aggregate. The name `elems` is not part of `array`'s interface. — end note]

### 23.3.7.2 `array` constructors, copy, and assignment [array.cons]

- <sup>1</sup> The conditions for an aggregate (8.5.1) shall be met. Class `array` relies on the implicitly-declared special member functions (12.1, 12.4, and 12.8) to conform to the container requirements table in 23.2. In addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be `MoveConstructible` or `MoveAssignable`, respectively.

**23.3.7.3 array specialized algorithms****[array.special]**

```
template <class T, size_t N>
void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
```

1 *Remarks:* This function shall not participate in overload resolution unless `N == 0` or `is_swappable_v<T>` is true.

2 *Effects:* As if by `x.swap(y)`.

3 *Complexity:* Linear in `N`.

**23.3.7.4 array::size****[array.size]**

```
template <class T, size_t N> constexpr size_type array<T, N>::size() const noexcept;
```

1 *Returns:* `N`

**23.3.7.5 array::data****[array.data]**

```
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

1 *Returns:* `elems`.

**23.3.7.6 array::fill****[array.fill]**

```
void fill(const T& u);
```

1 *Effects:* As if by `fill_n(begin(), N, u)`.

**23.3.7.7 array::swap****[array.swap]**

```
void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
```

1 *Effects:* As if by `swap_ranges(begin(), end(), y.begin())`.

2 *Throws:* Nothing unless one of the element-wise swap calls throws an exception.

3 *Note:* Unlike the `swap` function for other containers, `array::swap` takes linear time, may exit via an exception, and does not cause iterators to become associated with the other container.

**23.3.7.8 Zero sized arrays****[array.zero]**

1 `array` shall provide support for the special case `N == 0`.

2 In the case that `N == 0`, `begin() == end() == unique value`. The return value of `data()` is unspecified.

3 The effect of calling `front()` or `back()` for a zero-sized array is undefined.

4 Member function `swap()` shall have a *noexcept-specification* which is equivalent to `noexcept(true)`.

**23.3.7.9 Tuple interface to class template array****[array.tuple]**

```
template <class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };
```

```
tuple_element<I, array<T, N>>::type
```

1 *Requires:* `I < N`. The program is ill-formed if `I` is out of bounds.

2 *Value:* The type `T`.

```
template <size_t I, class T, size_t N>
constexpr T& get(array<T, N>& a) noexcept;
template <size_t I, class T, size_t N>
```

```
constexpr T&& get(array<T, N>&& a) noexcept;
template <size_t I, class T, size_t N>
constexpr const T& get(const array<T, N>& a) noexcept;
template <size_t I, class T, size_t N>
constexpr const T&& get(const array<T, N>&& a) noexcept;
```

<sup>3</sup> *Requires:*  $I < N$ . The program is ill-formed if  $I$  is out of bounds.

<sup>4</sup> *Returns:* A reference to the  $I$ th element of  $a$ , where indexing is zero-based.

### 23.3.8 Class template deque

[deque]

#### 23.3.8.1 Class template deque overview

[deque.overview]

- <sup>1</sup> A **deque** is a sequence container that supports random access iterators (24.2.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.
- <sup>2</sup> A **deque** satisfies all of the requirements of a container, of a reversible container (given in tables in 23.2), of a sequence container, including the optional sequence container requirements (23.2.3), and of an allocator-aware container (Table 106). Descriptions are provided here only for operations on **deque** that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
    template <class T, class Allocator = allocator<T>>
    class deque {
    public:
        // types:
        typedef value_type&                reference;
        typedef const value_type&          const_reference;
        typedef implementation-defined     iterator;           // see 23.2
        typedef implementation-defined     const_iterator;    // see 23.2
        typedef implementation-defined     size_type;         // see 23.2
        typedef implementation-defined     difference_type;   // see 23.2
        typedef T                          value_type;
        typedef Allocator                  allocator_type;
        typedef typename allocator_traits<Allocator>::pointer  pointer;
        typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
        typedef std::reverse_iterator<iterator>               reverse_iterator;
        typedef std::reverse_iterator<const_iterator>         const_reverse_iterator;

        // 23.3.8.2, construct/copy/destroy:
        deque() : deque(Allocator()) { }
        explicit deque(const Allocator&);
        explicit deque(size_type n, const Allocator& = Allocator());
        deque(size_type n, const T& value, const Allocator& = Allocator());
        template <class InputIterator>
            deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
        deque(const deque& x);
        deque(deque&&);
        deque(const deque&, const Allocator&);
        deque(deque&&, const Allocator&);
        deque(initializer_list<T>, const Allocator& = Allocator());

        ~deque();
        deque& operator=(const deque& x);
        deque& operator=(deque&& x);
```

```

    noexcept(allocator_traits<Allocator>::is_always_equal::value);
deque& operator=(initializer_list<T>);
template <class InputIterator>
    void assign(InputIterator first, InputIterator last);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// iterators:
iterator          begin() noexcept;
const_iterator    begin() const noexcept;
iterator          end() noexcept;
const_iterator    end() const noexcept;
reverse_iterator  rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator  rend() noexcept;
const_reverse_iterator rend() const noexcept;

const_iterator    cbegin() const noexcept;
const_iterator    cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 23.3.8.3, capacity:
bool      empty() const noexcept;
size_type size() const noexcept;

iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template <class InputIterator>

```

```

        iterator insert(const_iterator position, InputIterator first, InputIterator last);
        iterator insert(const_iterator position, initializer_list<T>);

        void pop_front();
        void pop_back();

        iterator erase(const_iterator position);
        iterator erase(const_iterator first, const_iterator last);
        void swap(deque&)
            noexcept(allocator_traits<Allocator>::is_always_equal::value);
        void clear() noexcept;
};

template <class T, class Allocator>
    bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template <class T, class Allocator>
    bool operator< (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template <class T, class Allocator>
    bool operator!=(const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template <class T, class Allocator>
    bool operator> (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template <class T, class Allocator>
    bool operator>= (const deque<T, Allocator>& x, const deque<T, Allocator>& y);
template <class T, class Allocator>
    bool operator<= (const deque<T, Allocator>& x, const deque<T, Allocator>& y);

// 23.3.8.5, specialized algorithms:
template <class T, class Allocator>
    void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));
}

```

### 23.3.8.2 deque constructors, copy, and assignment

[deque.cons]

```
explicit deque(const Allocator&);
```

1     *Effects:* Constructs an empty deque, using the specified allocator.

2     *Complexity:* Constant.

```
explicit deque(size_type n, const Allocator& = Allocator());
```

3     *Effects:* Constructs a deque with *n* default-inserted elements using the specified allocator.

4     *Requires:* T shall be DefaultInsertable into \*this.

5     *Complexity:* Linear in *n*.

```
deque(size_type n, const T& value, const Allocator& = Allocator());
```

6     *Effects:* Constructs a deque with *n* copies of *value*, using the specified allocator.

7     *Requires:* T shall be CopyInsertable into \*this.

8     *Complexity:* Linear in *n*.

```
template <class InputIterator>
```

```
    deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9     *Effects:* Constructs a deque equal to the range [*first*, *last*), using the specified allocator.

10    *Complexity:* Linear in *distance(first, last)*.

**23.3.8.3 deque capacity****[deque.capacity]**

```
void resize(size_type sz);
```

1 *Effects:* If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

2 *Requires:* T shall be MoveInsertable and DefaultInsertable into \*this.

```
void resize(size_type sz, const T& c);
```

3 *Effects:* If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

4 *Requires:* T shall be CopyInsertable into \*this.

```
void shrink_to_fit();
```

5 *Requires:* T shall be MoveInsertable into \*this.

6 *Complexity:* Linear in the size of the sequence.

7 *Remarks:* `shrink_to_fit` is a non-binding request to reduce memory use but does not change the size of the sequence. [ *Note:* The request is non-binding to allow latitude for implementation-specific optimizations. — *end note* ]

**23.3.8.4 deque modifiers****[deque.modifiers]**

```
iterator insert(const_iterator position, const T& x);
```

```
iterator insert(const_iterator position, T&& x);
```

```
iterator insert(const_iterator position, size_type n, const T& x);
```

```
template <class InputIterator>
```

```
    iterator insert(const_iterator position,
```

```
                  InputIterator first, InputIterator last);
```

```
iterator insert(const_iterator position, initializer_list<T>);
```

```
template <class... Args> void emplace_front(Args&&... args);
```

```
template <class... Args> void emplace_back(Args&&... args);
```

```
template <class... Args> iterator emplace(const_iterator position, Args&&... args);
```

```
void push_front(const T& x);
```

```
void push_front(T&& x);
```

```
void push_back(const T& x);
```

```
void push_back(T&& x);
```

1 *Effects:* An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 *Remarks:* If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-CopyInsertable T, the effects are unspecified.

3 *Complexity:* The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element either at the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

```
iterator erase(const_iterator position);
```

```
iterator erase(const_iterator first, const_iterator last);
```

```
void pop_front();
```

```
void pop_back();
```

- 4 *Effects:* An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque. [ *Note:* `pop_front` and `pop_back` are erase operations. — *end note* ]
- 5 *Complexity:* The number of calls to the destructor of `T` is the same as the number of elements erased, but the number of calls to the assignment operator of `T` is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.
- 6 *Throws:* Nothing unless an exception is thrown by the copy constructor, move constructor, assignment operator, or move assignment operator of `T`.

### 23.3.8.5 deque specialized algorithms

[deque.special]

```
template <class T, class Allocator>
void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
```

- 1 *Effects:* As if by `x.swap(y)`.

### 23.3.9 Class template forward\_list

[forwardlist]

#### 23.3.9.1 Class template forward\_list overview

[forwardlist.overview]

- 1 A `forward_list` is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported. [ *Note:* It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — *end note* ]
- 2 A `forward_list` satisfies all of the requirements of a container (Table 103), except that the `size()` member function is not provided and `operator==` has linear complexity. A `forward_list` also satisfies all of the requirements for an allocator-aware container (Table 106). In addition, a `forward_list` provides the `assign` member functions (Table 107) and several of the optional container requirements (Table 108). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.
- 3 [ *Note:* Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, ranges that are modified, such as those supplied to `erase` and `splice`, must be open at the beginning. — *end note* ]

```
namespace std {
    template <class T, class Allocator = allocator<T>>
    class forward_list {
    public:
        // types:
        typedef value_type&           reference;
        typedef const value_type&     const_reference;
        typedef implementation-defined iterator;           // see 23.2
        typedef implementation-defined const_iterator;     // see 23.2
        typedef implementation-defined size_type;           // see 23.2
        typedef implementation-defined difference_type;     // see 23.2
        typedef T                     value_type;
        typedef Allocator              allocator_type;
        typedef typename allocator_traits<Allocator>::pointer pointer;
        typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
```

```

// 23.3.9.2, construct/copy/destroy:
forward_list() : forward_list(Allocator()) { }
explicit forward_list(const Allocator&);
explicit forward_list(size_type n, const Allocator& = Allocator());
forward_list(size_type n, const T& value,
              const Allocator& = Allocator());
template <class InputIterator>
    forward_list(InputIterator first, InputIterator last,
                 const Allocator& = Allocator());

// capacity:
bool empty() const noexcept;
size_type max_size() const noexcept;

// 23.3.9.4, element access:
reference front();
const_reference front() const;

// 23.3.9.5, modifiers:
template <class... Args> void emplace_front(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void pop_front();

template <class... Args> iterator emplace_after(const_iterator position, Args&&... args);
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);

```

```

iterator insert_after(const_iterator position, size_type n, const T& x);
template <class InputIterator>
    iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
iterator insert_after(const_iterator position, initializer_list<T> il);

iterator erase_after(const_iterator position);
iterator erase_after(const_iterator position, const_iterator last);
void swap(forward_list&)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);

void resize(size_type sz);
void resize(size_type sz, const value_type& c);
void clear() noexcept;

// 23.3.9.6, forward_list operations:
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
void splice_after(const_iterator position, forward_list& x,
    const_iterator i);
void splice_after(const_iterator position, forward_list&& x,
    const_iterator i);
void splice_after(const_iterator position, forward_list& x,
    const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
    const_iterator first, const_iterator last);

void remove(const T& value);
template <class Predicate> void remove_if(Predicate pred);

void unique();
template <class BinaryPredicate> void unique(BinaryPredicate binary_pred);

void merge(forward_list& x);
void merge(forward_list&& x);
template <class Compare> void merge(forward_list& x, Compare comp);
template <class Compare> void merge(forward_list&& x, Compare comp);

void sort();
template <class Compare> void sort(Compare comp);

void reverse() noexcept;
};

template <class T, class Allocator>
    bool operator==(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator< (const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator!=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator> (const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator>=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
template <class T, class Allocator>

```

```
bool operator<=(const forward_list<T, Allocator>& x, const forward_list<T, Allocator>& y);
```

```
// 23.3.9.7, specialized algorithms:
```

```
template <class T, class Allocator>
void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
}
```

- 4 An incomplete type `T` may be used when instantiating `forward_list` if the allocator satisfies the allocator completeness requirements 17.6.3.5.1. `T` shall be complete before any member of the resulting specialization of `forward_list` is referenced.

### 23.3.9.2 `forward_list` constructors, copy, assignment

[forwardlist.cons]

```
explicit forward_list(const Allocator&);
```

- 1 *Effects:* Constructs an empty `forward_list` object using the specified allocator.

- 2 *Complexity:* Constant.

```
explicit forward_list(size_type n, const Allocator& = Allocator());
```

- 3 *Effects:* Constructs a `forward_list` object with `n` default-inserted elements using the specified allocator.

- 4 *Requires:* `T` shall be `DefaultInsertable` into `*this`.

- 5 *Complexity:* Linear in `n`.

```
forward_list(size_type n, const T& value, const Allocator& = Allocator());
```

- 6 *Effects:* Constructs a `forward_list` object with `n` copies of `value` using the specified allocator.

- 7 *Requires:* `T` shall be `CopyInsertable` into `*this`.

- 8 *Complexity:* Linear in `n`.

```
template <class InputIterator>
```

```
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

- 9 *Effects:* Constructs a `forward_list` object equal to the range `[first, last)`.

- 10 *Complexity:* Linear in `distance(first, last)`.

### 23.3.9.3 `forward_list` iterators

[forwardlist.iter]

```
iterator before_begin() noexcept;
```

```
const_iterator before_begin() const noexcept;
```

```
const_iterator cbefore_begin() const noexcept;
```

- 1 *Returns:* A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by `begin()`.

- 2 *Effects:* `cbefore_begin()` is equivalent to `const_cast<forward_list const*>(*this).before_begin()`.

- 3 *Remarks:* `before_begin() == end()` shall equal `false`.

### 23.3.9.4 `forward_list` element access

[forwardlist.access]

```
reference front();
```

```
const_reference front() const;
```

- 1 *Returns:* `*begin()`

**23.3.9.5 forward\_list modifiers****[forwardlist.modifiers]**

- 1 None of the overloads of `insert_after` shall affect the validity of iterators and references, and `erase_after` shall invalidate only iterators and references to the erased elements. If an exception is thrown during `insert_after` there shall be no effect. Inserting `n` elements into a `forward_list` is linear in `n`, and the number of calls to the copy or move constructor of `T` is exactly equal to `n`. Erasing `n` elements from a `forward_list` is linear in `n` and the number of calls to the destructor of type `T` is exactly equal to `n`.

```
template <class... Args> void emplace_front(Args&&... args);
```

- 2 *Effects:* Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...) at the beginning of the list.`

```
void push_front(const T& x);
void push_front(T&& x);
```

- 3 *Effects:* Inserts a copy of `x` at the beginning of the list.

```
void pop_front();
```

- 4 *Effects:* As if by `erase_after(before_begin())`.

```
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
```

- 5 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

- 6 *Effects:* Inserts a copy of `x` after `position`.

- 7 *Returns:* An iterator pointing to the copy of `x`.

```
iterator insert_after(const_iterator position, size_type n, const T& x);
```

- 8 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

- 9 *Effects:* Inserts `n` copies of `x` after `position`.

- 10 *Returns:* An iterator pointing to the last inserted copy of `x` or `position` if `n == 0`.

```
template <class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
```

- 11 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `first` and `last` are not iterators in `*this`.

- 12 *Effects:* Inserts copies of elements in `[first, last)` after `position`.

- 13 *Returns:* An iterator pointing to the last inserted element or `position` if `first == last`.

```
iterator insert_after(const_iterator position, initializer_list<T> il);
```

- 14 *Effects:* `insert_after(p, il.begin(), il.end())`.

- 15 *Returns:* An iterator pointing to the last inserted element or `position` if `il` is empty.

```
template <class... Args>
iterator emplace_after(const_iterator position, Args&&... args);
```

- 16 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

- 17 *Effects:* Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...) after position`.

- 18 *Returns:* An iterator pointing to the new object.

```
iterator erase_after(const_iterator position);
```

- 19     *Requires:* The iterator following `position` is dereferenceable.
- 20     *Effects:* Erases the element pointed to by the iterator following `position`.
- 21     *Returns:* An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.
- 22     *Throws:* Nothing.

```
iterator erase_after(const_iterator position, const_iterator last);
```

- 23     *Requires:* All iterators in the range `(position, last)` are dereferenceable.
- 24     *Effects:* Erases the elements in the range `(position, last)`.
- 25     *Returns:* `last`.
- 26     *Throws:* Nothing.

```
void resize(size_type sz);
```

- 27     *Effects:* If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` default-inserted elements at the end of the list.
- 28     *Requires:* `T` shall be `DefaultInsertable` into `*this`.

```
void resize(size_type sz, const value_type& c);
```

- 29     *Effects:* If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` copies of `c` at the end of the list.
- 30     *Requires:* `T` shall be `CopyInsertable` into `*this`.

```
void clear() noexcept;
```

- 31     *Effects:* Erases all elements in the range `[begin(), end())`.
- 32     *Remarks:* Does not invalidate past-the-end iterators.

### 23.3.9.6 forward\_list operations

[forwardlist.ops]

```
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
```

- 1     *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `get_allocator() == x.get_allocator(). &x != this`.
- 2     *Effects:* Inserts the contents of `x` after `position`, and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.
- 3     *Throws:* Nothing.
- 4     *Complexity:*  $\mathcal{O}(\text{distance}(x.\text{begin}(), x.\text{end}()))$

```
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

5 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.  
The iterator following `i` is a dereferenceable iterator in `x`. `get_allocator() == x.get_allocator()`.

6 *Effects:* Inserts the element following `i` into `*this`, following `position`, and removes it from `x`. The  
result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*++i` continue  
to refer to the same element but as a member of `*this`. Iterators to `*++i` continue to refer to the same  
element, but now behave as iterators into `*this`, not into `x`.

7 *Throws:* Nothing.

8 *Complexity:*  $\mathcal{O}(1)$

```
void splice_after(const_iterator position, forward_list& x,
                 const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
                 const_iterator first, const_iterator last);
```

9 *Requires:* `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.  
(`first`, `last`) is a valid range in `x`, and all iterators in the range (`first`, `last`) are dereferenceable.  
`position` is not an iterator in the range (`first`, `last`). `get_allocator() == x.get_allocator()`.

10 *Effects:* Inserts elements in the range (`first`, `last`) after `position` and removes the elements from `x`.  
Pointers and references to the moved elements of `x` now refer to those same elements but as members  
of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they  
now behave as iterators into `*this`, not into `x`.

11 *Complexity:*  $\mathcal{O}(\text{distance}(\text{first}, \text{last}))$

```
void remove(const T& value);
template <class Predicate> void remove_if(Predicate pred);
```

12 *Effects:* Erases all the elements in the list referred by a list iterator `i` for which the following conditions  
hold: `*i == value` (for `remove()`), `pred(*i)` is true (for `remove_if()`). Invalidates only the iterators  
and references to the erased elements.

13 *Throws:* Nothing unless an exception is thrown by the equality comparison or the predicate.

14 *Remarks:* Stable (17.6.5.7).

15 *Complexity:* Exactly `distance(begin(), end())` applications of the corresponding predicate.

```
void unique();
template <class BinaryPredicate> void unique(BinaryPredicate pred);
```

16 *Effects:* Erases all but the first element from every consecutive group of equal elements referred to  
by the iterator `i` in the range `[first + 1, last)` for which `*i == *(i-1)` (for the version with no  
arguments) or `pred(*i, *(i - 1))` (for the version with a predicate argument) holds. Invalidates  
only the iterators and references to the erased elements.

17 *Throws:* Nothing unless an exception is thrown by the equality comparison or the predicate.

18 *Complexity:* If the range `[first, last)` is not empty, exactly `(last - first) - 1` applications of  
the corresponding predicate, otherwise no applications of the predicate.

```
void merge(forward_list& x);
void merge(forward_list&& x);
template <class Compare> void merge(forward_list& x, Compare comp);
template <class Compare> void merge(forward_list&& x, Compare comp);
```

- 19 *Requires:* `comp` defines a strict weak ordering (25.5), and `*this` and `x` are both sorted according to this ordering. `get_allocator() == x.get_allocator()`.
- 20 *Effects:* Merges the two sorted ranges `[begin(), end())` and `[x.begin(), x.end())`. `x` is empty after the merge. If an exception is thrown other than by a comparison there are no effects. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.
- 21 *Remarks:* Stable (17.6.5.7). The behavior is undefined if `this->get_allocator() != x.get_allocator()`.
- 22 *Complexity:* At most `distance(begin(), end()) + distance(x.begin(), x.end()) - 1` comparisons.

```
void sort();
template <class Compare> void sort(Compare comp);
```

- 23 *Requires:* `operator<` (for the version with no arguments) or `comp` (for the version with a comparison argument) defines a strict weak ordering (25.5).
- 24 *Effects:* Sorts the list according to the `operator<` or the `comp` function object. If an exception is thrown the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.
- 25 *Remarks:* Stable (17.6.5.7).
- 26 *Complexity:* Approximately  $N \log N$  comparisons, where  $N$  is `distance(begin(), end())`.

```
void reverse() noexcept;
```

- 27 *Effects:* Reverses the order of the elements in the list. Does not affect the validity of iterators and references.
- 28 *Complexity:* Linear time.

### 23.3.9.7 forward\_list specialized algorithms

[forwardlist.spec]

```
template <class T, class Allocator>
void swap(forward_list<T, Allocator>& x, forward_list<T, Allocator>& y)
noexcept(noexcept(x.swap(y)));
```

- 1 *Effects:* As if by `x.swap(y)`.

### 23.3.10 Class template list

[list]

#### 23.3.10.1 Class template list overview

[list.overview]

- 1 A `list` is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (23.3.11) and deques (23.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.
- 2 A `list` satisfies all of the requirements of a container, of a reversible container (given in two tables in 23.2), of a sequence container, including most of the optional sequence container requirements (23.2.3), and of an allocator-aware container (Table 106). The exceptions are the `operator[]` and `at` member functions, which are not provided.<sup>264</sup> Descriptions are provided here only for operations on `list` that are not described in one of these tables or for operations where there is additional semantic information.

<sup>264</sup>) These member functions are only provided by containers whose iterators are random access iterators.

```

namespace std {
    template <class T, class Allocator = allocator<T>>
    class list {
    public:
        // types:
        typedef value_type&                reference;
        typedef const value_type&          const_reference;
        typedef implementation-defined    iterator;           // see 23.2
        typedef implementation-defined    const_iterator;       // see 23.2
        typedef implementation-defined    size_type;           // see 23.2
        typedef implementation-defined    difference_type;     // see 23.2
        typedef T                          value_type;
        typedef Allocator                  allocator_type;
        typedef typename allocator_traits<Allocator>::pointer    pointer;
        typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
        typedef std::reverse_iterator<iterator>    reverse_iterator;
        typedef std::reverse_iterator<const_iterator> const_reverse_iterator;

        // 23.3.10.2, construct/copy/destroy:
        list() : list(Allocator()) { }
        explicit list(const Allocator&);
        explicit list(size_type n, const Allocator& = Allocator());
        list(size_type n, const T& value, const Allocator& = Allocator());
        template <class InputIterator>
            list(InputIterator first, InputIterator last, const Allocator& = Allocator());
        list(const list& x);
        list(list&& x);
        list(const list&, const Allocator&);
        list(list&&, const Allocator&);
        list(initializer_list<T>, const Allocator& = Allocator());
        ~list();
        list& operator=(const list& x);
        list& operator=(list&& x)
            noexcept(allocator_traits<Allocator>::is_always_equal::value);
        list& operator=(initializer_list<T>);
        template <class InputIterator>
            void assign(InputIterator first, InputIterator last);
        void assign(size_type n, const T& t);
        void assign(initializer_list<T>);
        allocator_type get_allocator() const noexcept;

        // iterators:
        iterator          begin() noexcept;
        const_iterator    begin() const noexcept;
        iterator          end() noexcept;
        const_iterator    end() const noexcept;
        reverse_iterator  rbegin() noexcept;
        const_reverse_iterator rbegin() const noexcept;
        reverse_iterator  rend() noexcept;
        const_reverse_iterator rend() const noexcept;

        const_iterator    cbegin() const noexcept;
        const_iterator    cend() const noexcept;
        const_reverse_iterator crbegin() const noexcept;
        const_reverse_iterator crend() const noexcept;
    };
}

```

```

// 23.3.10.3, capacity:
bool      empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
void      resize(size_type sz);
void      resize(size_type sz, const T& c);

// element access:
reference  front();
const_reference front() const;
reference  back();
const_reference back() const;

// 23.3.10.4, modifiers:
template <class... Args> void emplace_front(Args&&... args);
void pop_front();
template <class... Args> void emplace_back(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);
void pop_back();

template <class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template <class InputIterator>
    iterator insert(const_iterator position, InputIterator first,
                    InputIterator last);
iterator insert(const_iterator position, initializer_list<T> il);

iterator erase(const_iterator position);
iterator erase(const_iterator position, const_iterator last);
void      swap(list&)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
void      clear() noexcept;

// 23.3.10.5, list operations:
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
void splice(const_iterator position, list& x,
            const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x,
            const_iterator first, const_iterator last);

void remove(const T& value);
template <class Predicate> void remove_if(Predicate pred);

void unique();
template <class BinaryPredicate>
    void unique(BinaryPredicate binary_pred);

```

```

    void merge(list& x);
    void merge(list&& x);
    template <class Compare> void merge(list& x, Compare comp);
    template <class Compare> void merge(list&& x, Compare comp);

    void sort();
    template <class Compare> void sort(Compare comp);

    void reverse() noexcept;
};

template <class T, class Allocator>
    bool operator==(const list<T, Allocator>& x, const list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator< (const list<T, Allocator>& x, const list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator!=(const list<T, Allocator>& x, const list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator> (const list<T, Allocator>& x, const list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator>=(const list<T, Allocator>& x, const list<T, Allocator>& y);
template <class T, class Allocator>
    bool operator<=(const list<T, Allocator>& x, const list<T, Allocator>& y);

// 23.3.10.6, specialized algorithms:
template <class T, class Allocator>
    void swap(list<T, Allocator>& x, list<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));
}

```

- 3 An incomplete type `T` may be used when instantiating `list` if the allocator satisfies the allocator completeness requirements 17.6.3.5.1. `T` shall be complete before any member of the resulting specialization of `list` is referenced.

### 23.3.10.2 `list` constructors, copy, and assignment

[list.cons]

```
explicit list(const Allocator&);
```

- 1 *Effects:* Constructs an empty list, using the specified allocator.  
 2 *Complexity:* Constant.

```
explicit list(size_type n, const Allocator& = Allocator());
```

- 3 *Effects:* Constructs a list with `n` default-inserted elements using the specified allocator.  
 4 *Requires:* `T` shall be `DefaultInsertable` into `*this`.  
 5 *Complexity:* Linear in `n`.

```
list(size_type n, const T& value, const Allocator& = Allocator());
```

- 6 *Effects:* Constructs a list with `n` copies of `value`, using the specified allocator.  
 7 *Requires:* `T` shall be `CopyInsertable` into `*this`.  
 8 *Complexity:* Linear in `n`.

```
template <class InputIterator>
    list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

9       *Effects:* Constructs a list equal to the range [first, last).

10       *Complexity:* Linear in distance(first, last).

### 23.3.10.3 list capacity

[list.capacity]

```
void resize(size_type sz);
```

1       *Effects:* If size() < sz, appends sz - size() default-inserted elements to the sequence. If sz <= size(), equivalent to:

```
    list<T>::iterator it = begin();
    advance(it, sz);
    erase(it, end());
```

2       *Requires:* T shall be DefaultInsertable into \*this.

```
void resize(size_type sz, const T& c);
```

3       *Effects:* As if by:

```
    if (sz > size())
        insert(end(), sz-size(), c);
    else if (sz < size()) {
        iterator i = begin();
        advance(i, sz);
        erase(i, end());
    }
    else
        ; // do nothing
```

4       *Requires:* T shall be CopyInsertable into \*this.

### 23.3.10.4 list modifiers

[list.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template <class InputIterator>
```

```
    iterator insert(const_iterator position, InputIterator first,
                    InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);
```

```
template <class... Args> void emplace_front(Args&&... args);
template <class... Args> void emplace_back(Args&&... args);
template <class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);
```

1       *Remarks:* Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

2       *Complexity:* Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.

```
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
```

```
void pop_front();
void pop_back();
void clear() noexcept;
```

3     *Effects:* Invalidates only the iterators and references to the erased elements.

4     *Throws:* Nothing.

5     *Complexity:* Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

### 23.3.10.5 list operations

[list.ops]

1 Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.<sup>265</sup>

2 `list` provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if `get_allocator() != x.get_allocator()`.

```
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
```

3     *Requires:* `&x != this`.

4     *Effects:* Inserts the contents of `x` before `position` and `x` becomes empty. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

5     *Throws:* Nothing.

6     *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
```

7     *Effects:* Inserts an element pointed to by `i` from list `x` before `position` and removes the element from `x`. The result is unchanged if `position == i` or `position == ++i`. Pointers and references to `*i` continue to refer to this same element but as a member of `*this`. Iterators to `*i` (including `i` itself) continue to refer to the same element, but now behave as iterators into `*this`, not into `x`.

8     *Requires:* `i` is a valid dereferenceable iterator of `x`.

9     *Throws:* Nothing.

10    *Complexity:* Constant time.

```
void splice(const_iterator position, list& x, const_iterator first,
            const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first,
            const_iterator last);
```

11    *Effects:* Inserts elements in the range `[first, last)` before `position` and removes the elements from `x`.

12    *Requires:* `[first, last)` is a valid range in `x`. The result is undefined if `position` is an iterator in the range `[first, last)`. Pointers and references to the moved elements of `x` now refer to those same

---

<sup>265</sup>) As specified in 17.6.3.5, the requirements in this Clause apply only to lists whose allocators compare equal.

elements but as members of *\*this*. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *\*this*, not into *x*.

13 *Throws*: Nothing.

14 *Complexity*: Constant time if `&x == this`; otherwise, linear time.

```
void remove(const T& value);
template <class Predicate> void remove_if(Predicate pred);
```

15 *Effects*: Erases all the elements in the list referred by a list iterator *i* for which the following conditions hold: `*i == value`, `pred(*i) != false`. Invalidates only the iterators and references to the erased elements.

16 *Throws*: Nothing unless an exception is thrown by `*i == value` or `pred(*i) != false`.

17 *Remarks*: Stable (17.6.5.7).

18 *Complexity*: Exactly `size()` applications of the corresponding predicate.

```
void unique();
template <class BinaryPredicate> void unique(BinaryPredicate binary_pred);
```

19 *Effects*: Erases all but the first element from every consecutive group of equal elements referred to by the iterator *i* in the range `[first + 1, last)` for which `*i == *(i-1)` (for the version of `unique` with no arguments) or `pred(*i, *(i - 1))` (for the version of `unique` with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.

20 *Throws*: Nothing unless an exception is thrown by `*i == *(i-1)` or `pred(*i, *(i - 1))`

21 *Complexity*: If the range `[first, last)` is not empty, exactly `(last - first) - 1` applications of the corresponding predicate, otherwise no applications of the predicate.

```
void merge(list& x);
void merge(list&& x);
template <class Compare> void merge(list& x, Compare comp);
template <class Compare> void merge(list&& x, Compare comp);
```

22 *Requires*: `comp` shall define a strict weak ordering (25.5), and both the list and the argument list shall be sorted according to this ordering.

23 *Effects*: If `(&x == this)` does nothing; otherwise, merges the two sorted ranges `[begin(), end())` and `[x.begin(), x.end())`. The result is a range in which the elements will be sorted in non-decreasing order according to the ordering defined by `comp`; that is, for every iterator *i*, in the range other than the first, the condition `comp(*i, *(i - 1))` will be false. Pointers and references to the moved elements of *x* now refer to those same elements but as members of *\*this*. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *\*this*, not into *x*.

24 *Remarks*: Stable (17.6.5.7). If `(&x != this)` the range `[x.begin(), x.end())` is empty after the merge. No elements are copied by this operation. The behavior is undefined if `this->get_allocator() != x.get_allocator()`.

25 *Complexity*: At most `size() + x.size() - 1` applications of `comp` if `(&x != this)`; otherwise, no applications of `comp` are performed. If an exception is thrown other than by a comparison there are no effects.

```
void reverse() noexcept;
```

26 *Effects*: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

27 *Complexity*: Linear time.

```
void sort();
template <class Compare> void sort(Compare comp);
```

- 28 *Requires:* `operator<` (for the first version) or `comp` (for the second version) shall define a strict weak ordering (25.5).
- 29 *Effects:* Sorts the list according to the `operator<` or a `Compare` function object. Does not affect the validity of iterators and references.
- 30 *Remarks:* Stable (17.6.5.7).
- 31 *Complexity:* Approximately  $N \log(N)$  comparisons, where  $N == \text{size}()$ .

### 23.3.10.6 list specialized algorithms

[list.special]

```
template <class T, class Allocator>
void swap(list<T, Allocator>& x, list<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
```

- 1 *Effects:* As if by `x.swap(y)`.

### 23.3.11 Class template vector

[vector]

#### 23.3.11.1 Class template vector overview

[vector.overview]

- 1 A **vector** is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.
- 2 A **vector** satisfies all of the requirements of a container and of a reversible container (given in two tables in 23.2), of a sequence container, including most of the optional sequence container requirements (23.2.3), of an allocator-aware container (Table 106), and, for an element type other than `bool`, of a contiguous container (23.2.1). The exceptions are the `push_front`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on **vector** that are not described in one of these tables or for operations where there is additional semantic information.

```
namespace std {
    template <class T, class Allocator = allocator<T>>
    class vector {
    public:
        // types:
        typedef value_type&                reference;
        typedef const value_type&          const_reference;
        typedef implementation-defined     iterator;           // see 23.2
        typedef implementation-defined     const_iterator;    // see 23.2
        typedef implementation-defined     size_type;         // see 23.2
        typedef implementation-defined     difference_type;   // see 23.2
        typedef T                          value_type;
        typedef Allocator                  allocator_type;
        typedef typename allocator_traits<Allocator>::pointer pointer;
        typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
        typedef std::reverse_iterator<iterator> reverse_iterator;
        typedef std::reverse_iterator<const_iterator> const_reverse_iterator;

        // 23.3.11.2, construct/copy/destroy:
        vector() noexcept(Allocator()) : vector(Allocator()) { }
        explicit vector(const Allocator&) noexcept;
        explicit vector(size_type n, const Allocator& = Allocator());
        vector(size_type n, const T& value, const Allocator& = Allocator());
        template <class InputIterator>
```

```

    vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
vector(const vector& x);
vector(vector&&) noexcept;
vector(const vector&, const Allocator&);
vector(vector&&, const Allocator&);
vector(initializer_list<T>, const Allocator& = Allocator());
~vector();
vector& operator=(const vector& x);
vector& operator=(vector&& x)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
        allocator_traits<Allocator>::is_always_equal::value);
vector& operator=(initializer_list<T>);
template <class InputIterator>
    void assign(InputIterator first, InputIterator last);
void assign(size_type n, const T& u);
void assign(initializer_list<T>);
allocator_type get_allocator() const noexcept;

// iterators:
iterator          begin() noexcept;

    iterator insert(const_iterator position, const T& x);
    iterator insert(const_iterator position, T&& x);
    iterator insert(const_iterator position, size_type n, const T& x);
    template <class InputIterator>
        iterator insert(const_iterator position, InputIterator first, InputIterator last);
    iterator insert(const_iterator position, initializer_list<T> il);
    iterator erase(const_iterator position);
    iterator erase(const_iterator first, const_iterator last);
    void swap(vector&)
        noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
            allocator_traits<Allocator>::is_always_equal::value);
    void clear() noexcept;
};

template <class T, class Allocator>
    bool operator==(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator< (const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator!=(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator> (const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator>=(const vector<T, Allocator>& x, const vector<T, Allocator>& y);
template <class T, class Allocator>
    bool operator<=(const vector<T, Allocator>& x, const vector<T, Allocator>& y);

    // 23.3.11.6, specialized algorithms:
    template <class T, class Allocator>
        void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
            noexcept(noexcept(x.swap(y)));
}

```

- <sup>3</sup> An incomplete type *T* may be used when instantiating `vector` if the allocator satisfies the allocator completeness requirements 17.6.3.5.1. *T* shall be complete before any member of the resulting specialization of `vector` is referenced.

### 23.3.11.2 vector constructors, copy, and assignment

[vector.cons]

```
explicit vector(const Allocator&);
```

- 1 *Effects:* Constructs an empty `vector`, using the specified allocator.
- 2 *Complexity:* Constant.

```
explicit vector(size_type n, const Allocator& = Allocator());
```

- 3 *Effects:* Constructs a `vector` with *n* default-inserted elements using the specified allocator.

4 *Requires:* T shall be `DefaultInsertable` into `*this`.

5 *Complexity:* Linear in `n`.

```
vector(size_type n, const T& value,
      const Allocator& = Allocator());
```

6 *Effects:* Constructs a `vector` with `n` copies of `value`, using the specified allocator.

7 *Requires:* T shall be `CopyInsertable` into `*this`.

8 *Complexity:* Linear in `n`.

```
template <class InputIterator>
vector(InputIterator first, InputIterator last,
      const Allocator& = Allocator());
```

9 *Effects:* Constructs a `vector` equal to the range `[first, last)`, using the specified allocator.

10 *Complexity:* Makes only  $N$  calls to the copy constructor of T (where  $N$  is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order  $N$  calls to the copy constructor of T and order  $\log(N)$  reallocations if they are just input iterators.

### 23.3.11.3 vector capacity

[`vector.capacity`]

```
size_type capacity() const noexcept;
```

1 *Returns:* The total number of elements that the vector can hold without requiring reallocation.

```
void reserve(size_type n);
```

2 *Requires:* T shall be `MoveInsertable` into `*this`.

3 *Effects:* A directive that informs a `vector` of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-`CopyInsertable` type, there are no effects.

4 *Complexity:* It does not change the size of the sequence and takes at most linear time in the size of the sequence.

5 *Throws:* `length_error` if `n > max_size()`.<sup>266</sup>

6 *Remarks:* Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. No reallocation shall take place during insertions that happen after a call to `reserve()` until the time when an insertion would make the size of the vector greater than the value of `capacity()`.

```
void shrink_to_fit();
```

7 *Requires:* T shall be `MoveInsertable` into `*this`.

8 *Complexity:* Linear in the size of the sequence.

9 *Remarks:* `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`. [Note: The request is non-binding to allow latitude for implementation-specific optimizations. — end note] If an exception is thrown other than by the move constructor of a non-`CopyInsertable` T there are no effects.

---

<sup>266</sup>) `reserve()` uses `Allocator::allocate()` which may throw an appropriate exception.

```
void swap(vector& x)
    noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
             allocator_traits<Allocator>::is_always_equal::value);
```

10 *Effects:* Exchanges the contents and `capacity()` of `*this` with that of `x`.

11 *Complexity:* Constant time.

```
void resize(size_type sz);
```

12 *Effects:* If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

13 *Requires:* `T` shall be `MoveInsertable` and `DefaultInsertable` into `*this`.

14 *Remarks:* If an exception is thrown other than by the move constructor of a non-`CopyInsertable` `T` there are no effects.

```
void resize(size_type sz, const T& c);
```

15 *Effects:* If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

16 *Requires:* `T` shall be `CopyInsertable` into `*this`.

17 *Remarks:* If an exception is thrown there are no effects.

#### 23.3.11.4 vector data

[vector.data]

```
T*      data() noexcept;
const T* data() const noexcept;
```

1 *Returns:* A pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

2 *Complexity:* Constant time.

#### 23.3.11.5 vector modifiers

[vector.modifiers]

```
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template <class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);
```

```
template <class... Args> void emplace_back(Args&&... args);
template <class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_back(const T& x);
void push_back(T&& x);
```

1 *Remarks:* Causes reallocation if the new size is greater than the old capacity. If no reallocation happens, all the iterators and references before the insertion point remain valid. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of `T` or by any `InputIterator` operation there are no effects. If an exception is thrown while inserting a single element at the end and `T` is `CopyInsertable` or `is_nothrow_move_constructible<T>::value` is `true`, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-`CopyInsertable` `T`, the effects are unspecified.

2 *Complexity:* The complexity is linear in the number of elements inserted plus the distance to the end of the vector.

```

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_back();

```

- 3     *Effects:* Invalidates iterators and references at or after the point of the erase.
- 4     *Complexity:* The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.
- 5     *Throws:* Nothing unless an exception is thrown by the copy constructor, move constructor, assignment operator, or move assignment operator of T.

### 23.3.11.6 vector specialized algorithms

[vector.special]

```

template <class T, class Allocator>
void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));

```

- 1     *Effects:* As if by x.swap(y).

### 23.3.12 Class vector<bool>

[vector.bool]

- 1 To optimize space allocation, a specialization of vector for bool elements is provided:

```

namespace std {
    template <class Allocator>
    class vector<bool, Allocator> {
    public:
        // types:
        typedef bool                                const_reference;
        typedef implementation-defined            iterator;           // see 23.2
        typedef implementation-defined            const_iterator;      // see 23.2
        typedef implementation-defined            size_type;           // see 23.2
        typedef implementation-defined            difference_type;     // see 23.2
        typedef bool                                value_type;
        typedef Allocator                            allocator_type;
        typedef implementation-defined            pointer;
        typedef implementation-defined            const_pointer;
        typedef std::reverse_iterator<iterator>      reverse_iterator;
        typedef std::reverse_iterator<const_iterator> const_reverse_iterator;

        // bit reference:
        class reference {
            friend class vector;
            reference() noexcept;
        public:
            ~reference();
            operator bool() const noexcept;
            reference& operator=(const bool x) noexcept;
            reference& operator=(const reference& x) noexcept;
            void flip() noexcept;           // flips the bit
        };

        // construct/copy/destroy:
        vector() : vector(Allocator()) { }
        explicit vector(const Allocator&);
        explicit vector(size_type n, const Allocator& = Allocator());
        vector(size_type n, const bool& value,

```

```

        const Allocator& = Allocator());
template <class InputIterator>
    vector(InputIterator first, InputIterator last,
           const Allocator& = Allocator());
vector(const vector<bool, Allocator>& x);
vector(vector<bool, Allocator>&& x);
vector(const vector&, const Allocator&);
vector(vector&&, const Allocator&);
vector(initializer_list<bool>, const Allocator& = Allocator());
~vector();
vector<bool, Allocator>& operator=(const vector<bool, Allocator>& x);
vector<bool, Allocator>& operator=(vector<bool, Allocator>&& x);
vector& operator=(initializer_list<bool>);
template <class InputIterator>
    void assign(InputIterator first, InputIterator last);
void assign(size_type n, const bool& t);
void assign(initializer_list<bool>);
allocator_type get_allocator() const noexcept;

// iterators:
iterator          begin() noexcept;
const_iterator    begin() const noexcept;
iterator          end() noexcept;
const_iterator    end() const noexcept;
reverse_iterator  rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator  rend() noexcept;
const_reverse_iterator rend() const noexcept;

const_iterator    cbegin() const noexcept;
const_iterator    cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// capacity:
bool              empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
size_type capacity() const noexcept;
void              resize(size_type sz, bool c = false);
void              reserve(size_type n);
void              shrink_to_fit();

// element access:
reference         operator[](size_type n);
const_reference   operator[](size_type n) const;
const_reference   at(size_type n) const;
reference         at(size_type n);
reference         front();
const_reference   front() const;
reference         back();
const_reference   back() const;

// modifiers:
template <class... Args> void emplace_back(Args&&... args);

```

```

void push_back(const bool& x);
void pop_back();
template <class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const bool& x);
iterator insert(const_iterator position, size_type n, const bool& x);
template <class InputIterator>
    iterator insert(const_iterator position,
                    InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<bool> il);

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(vector<bool, Allocator>&);
static void swap(reference x, reference y) noexcept;
void flip() noexcept;           // flips all bits
void clear() noexcept;
};
}

```

- <sup>2</sup> Unless described below, all operations have the same requirements and semantics as the primary `vector` template, except that operations dealing with the `bool` value type map to bit values in the container storage and `allocator_traits::construct` (20.9.8.2) is not used to construct these values.
- <sup>3</sup> There is no requirement that the data be stored as a contiguous allocation of `bool` values. A space-optimized representation of bits is recommended instead.
- <sup>4</sup> `reference` is a class that simulates the behavior of references of a single bit in `vector<bool>`. The conversion operator returns `true` when the bit is set, and `false` otherwise. The assignment operator sets the bit when the argument is (convertible to) `true` and clears it otherwise. `flip` reverses the state of the bit.

```
void flip() noexcept;
```

- <sup>5</sup> *Effects:* Replaces each element in the container with its complement.

```
static void swap(reference x, reference y) noexcept;
```

- <sup>6</sup> *Effects:* Exchanges the contents of `x` and `y` as if by:

```

bool b = x;
x = y;
y = b;

```

```
template <class Allocator> struct hash<vector<bool, Allocator>>;
```

- <sup>7</sup> The template specialization shall meet the requirements of class template `hash` (20.12.14).

## 23.4 Associative containers

[associative]

### 23.4.1 In general

[associative.general]

- <sup>1</sup> The header `<map>` defines the class templates `map` and `multimap`; the header `<set>` defines the class templates `set` and `multiset`.

### 23.4.2 Header `<map>` synopsis

[associative.map.syn]

```

#include <initializer_list>

namespace std {
    // 23.4.4, class template map:

```

```

template <class Key, class T, class Compare = less<Key>,
          class Allocator = allocator<pair<const Key, T>>>
    class map;
template <class Key, class T, class Compare, class Allocator>
    bool operator==(const map<Key, T, Compare, Allocator>& x,
                    const map<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator< (const map<Key, T, Compare, Allocator>& x,
                   const map<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator!=(const map<Key, T, Compare, Allocator>& x,
                    const map<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator> (const map<Key, T, Compare, Allocator>& x,
                    const map<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator>= (const map<Key, T, Compare, Allocator>& x,
                     const map<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    void swap(map<Key, T, Compare, Allocator>& x,
              map<Key, T, Compare, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

// 23.4.5, class template multimap:
template <class Key, class T, class Compare = less<Key>,
          class Allocator = allocator<pair<const Key, T>>>
    class multimap;
template <class Key, class T, class Compare, class Allocator>
    bool operator==(const multimap<Key, T, Compare, Allocator>& x,
                    const multimap<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator< (const multimap<Key, T, Compare, Allocator>& x,
                   const multimap<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator!=(const multimap<Key, T, Compare, Allocator>& x,
                    const multimap<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator> (const multimap<Key, T, Compare, Allocator>& x,
                    const multimap<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    bool operator>= (const multimap<Key, T, Compare, Allocator>& x,
                     const multimap<Key, T, Compare, Allocator>& y);
template <class Key, class T, class Compare, class Allocator>
    void swap(multimap<Key, T, Compare, Allocator>& x,
              multimap<Key, T, Compare, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

namespace pmr {
    template <class Key, class T, class Compare = less<Key>>

```

```

        using map = std::map<Key, T, Compare,
                        polymorphic_allocator<pair<const Key, T>>>;

        template <class Key, class T, class Compare = less<Key>>
        using multimap = std::multimap<Key, T, Compare,
                                      polymorphic_allocator<pair<const Key, T>>>;
    }
}

```

### 23.4.3 Header <set> synopsis

[associative.set.syn]

```

#include <initializer_list>

namespace std {
    // 23.4.6, class template set:
    template <class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class set;
    template <class Key, class Compare, class Allocator>
    bool operator==(const set<Key, Compare, Allocator>& x,
                    const set<Key, Compare, Allocator>& y);
    template <class Key, class Compare, class Allocator>
    bool operator< (const set<Key, Compare, Allocator>& x,
                    const set<Key, Compare, Allocator>& y);
    template <class Key, class Compare, class Allocator>
    bool operator!=(const set<Key, Compare, Allocator>& x,
                    const set<Key, Compare, Allocator>& y);
    template <class Key, class Compare, class Allocator>
    bool operator> (const set<Key, Compare, Allocator>& x,
                    const set<Key, Compare, Allocator>& y);
    template <class Key, class Compare, class Allocator>
    bool operator>= (const set<Key, Compare, Allocator>& x,
                     const set<Key, Compare, Allocator>& y);
    template <class Key, class Compare, class Allocator>
    bool operator<= (const set<Key, Compare, Allocator>& x,
                     const set<Key, Compare, Allocator>& y);
    template <class Key, class Compare, class Allocator>
    void swap(set<Key, Compare, Allocator>& x,
              set<Key, Compare, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

    // 23.4.6, class template multiset:
    template <class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class multiset;
    template <class Key, class Compare, class Allocator>
    bool operator==(const multiset<Key, Compare, Allocator>& x,
                    const multiset<Key, Compare, Allocator>& y);

    bool operator<=(const multiset<Key, Compare, Allocator>& x,
        const multiset<Key, Compare, Allocator>& y);
template <class Key, class Compare, class Allocator>
    void swap(multiset<Key, Compare, Allocator>& x,
        multiset<Key, Compare, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

namespace pmr {
    template <class Key, class Compare = less<Key>>
        using set = std::set<Key, Compare,
            polymorphic_allocator<Key>>;

    template <class Key, class Compare = less<Key>>
        using multiset = std::multiset<Key, Compare,
            polymorphic_allocator<Key>>;
}
}

```

## 23.4.4 Class template map

[map]

### 23.4.4.1 Class template map overview

[map.overview]

- <sup>1</sup> A `map` is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type `T` based on the keys. The `map` class supports bidirectional iterators.
- <sup>2</sup> A `map` satisfies all of the requirements of a container, of a reversible container (23.2), of an associative container (23.2.4), and of an allocator-aware container (Table 106). A `map` also provides most operations described in (23.2.4) for unique keys. This means that a `map` supports the `a_uniq` operations in (23.2.4) but not the `a_eq` operations. For a `map<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `map` that are not described in one of those tables or for operations where there is additional semantic information.

```

namespace std {
    template <class Key, class T, class Compare = less<Key>,
        class Allocator = allocator<pair<const Key, T>>>

}

```

**23.4.4.2 map constructors, copy, and assignment****[map.cons]**

```
explicit map(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty map using the specified comparison object and allocator.

2 *Complexity:* Constant.

```
template <class InputIterator>
    map(InputIterator first, InputIterator last,
        const Compare& comp = Compare(), const Allocator& = Allocator());
```

3 *Effects:* Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 *Complexity:* Linear in  $N$  if the range [first, last) is already sorted using comp and otherwise  $N \log N$ , where  $N$  is last - first.

**23.4.4.3 map element access****[map.access]**

```
T& operator[] (const key_type& x);
```

1 *Effects:* Equivalent to: return try\_emplace(x).first->second;

```
T& operator[] (key_type&& x);
```

2 *Effects:* Equivalent to: return try\_emplace(move(x)).first->second;

```
T& at(const key_type& x);
const T& at(const key_type& x) const;
```

3 *Returns:* A reference to the mapped\_type corresponding to x in \*this.

4 *Throws:* An exception object of type out\_of\_range if no such element is present.

5 *Complexity:* Logarithmic.

**23.4.4.4 map modifiers****[map.modifiers]**

```
template <class P> pair<iterator, bool> insert(P&& x);
template <class P> iterator insert(const_iterator position, P&& x);
```

1 *Effects:* The first form is equivalent to return emplace(std::forward<P>(x)). The second form is equivalent to return emplace\_hint(position, std::forward<P>(x)).

2 *Remarks:* These signatures shall not participate in overload resolution unless std::is\_constructible<value\_type, P&&>::value is true.

```
template <class... Args> pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template <class... Args> iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

3 *Requires:* value\_type shall be EmplaceConstructible into map from piecewise\_construct, forward\_as\_tuple(k), forward\_as\_tuple(forward<Args>(args)...).

4 *Effects:* If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value\_type constructed with piecewise\_construct, forward\_as\_tuple(k), forward\_as\_tuple(forward<Args>(args)...).

5 *Returns:* In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

6 *Complexity:* The same as emplace and emplace\_hint, respectively.

```
template <class... Args> pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template <class... Args> iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

7     *Requires:* `value_type` shall be `EmplaceConstructible` into `map` from `piecewise_construct`, `forward_as_tuple(move(k))`, `forward_as_tuple(forward<Args>(args)...)...`.

8     *Effects:* If the `map` already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(move(k))`, `forward_as_tuple(forward<Args>(args)...)...`.

9     *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the `map` element whose key is equivalent to `k`.

10    *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template <class M> pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template <class M> iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

11    *Requires:* `is_assignable<mapped_type&, M&&>::value` shall be `true`. `value_type` shall be `EmplaceConstructible` into `map` from `k`, `forward<M>(obj)`.

12    *Effects:* If the `map` already contains an element `e` whose key is equivalent to `k`, assigns `forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `forward<M>(obj)`.

13    *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the `map` element whose key is equivalent to `k`.

14    *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template <class M> pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template <class M> iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

15    *Requires:* `is_assignable<mapped_type&, M&&>::value` shall be `true`. `value_type` shall be `EmplaceConstructible` into `map` from `move(k)`, `forward<M>(obj)`.

16    *Effects:* If the `map` already contains an element `e` whose key is equivalent to `k`, assigns `forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `move(k)`, `forward<M>(obj)`.

17    *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the `map` element whose key is equivalent to `k`.

18    *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

#### 23.4.4.5 map specialized algorithms

[map.special]

```
template <class Key, class T, class Compare, class Allocator>
void swap(map<Key, T, Compare, Allocator>& x,
         map<Key, T, Compare, Allocator>& y)
noexcept(noexcept(x.swap(y)));
```

1     *Effects:* As if by `x.swap(y)`.

### 23.4.5 Class template `multimap`

[multimap]

#### 23.4.5.1 Class template `multimap` overview

[multimap.overview]

1 A `multimap` is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type `T` based on the keys. The `multimap` class supports bidirectional iterators.

2 A `multimap` satisfies all of the requirements of a container and of a reversible container (23.2), of an associative container (23.2.4), and of an allocator-aware container (Table 106). A `multimap` also provides most operations described in (23.2.4) for equal keys. This means that a `multimap` supports the `a_eq` operations in (23.2.4) but

not the `a_uniq` operations. For a `multimap<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key,T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```
namespace std {
    template <class Key, class T, class Compare = less<Key>,
              class Allocator = allocator<pair<const Key, T>>>
    class multimap {
    public:
        // types:
        typedef Key                key_type;
        typedef T                  mapped_type;
        typedef pair<const Key,T>  value_type;
        typedef Compare            key_compare;
        typedef Allocator          allocator_type;
        typedef value_type&        reference;
        typedef const value_type&  const_reference;
        typedef implementation-defined iterator;           // see 23.2
        typedef implementation-defined const_iterator;      // see 23.2

}

```

### 23.4.5.2 multimap constructors

[multimap.cons]

```
explicit multimap(const Compare& comp, const Allocator& = Allocator());
```

1 *Effects:* Constructs an empty multimap using the specified comparison object and allocator.

2 *Complexity:* Constant.

```
template <class InputIterator>
    multimap(InputIterator first, InputIterator last,
             const Compare& comp = Compare(),
             const Allocator& = Allocator());
```

3 *Effects:* Constructs an empty multimap using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 *Complexity:* Linear in  $N$  if the range [first, last) is already sorted using comp and otherwise  $N \log N$ , where  $N$  is last - first.

### 23.4.5.3 multimap modifiers

[multimap.modifiers]

```
template <class P> iterator insert(P&& x);
template <class P> iterator insert(const_iterator position, P&& x);
```

1 *Effects:* The first form is equivalent to return `emplace(std::forward<P>(x))`. The second form is equivalent to return `emplace_hint(position, std::forward<P>(x))`.

2 *Remarks:* These signatures shall not participate in overload resolution unless `std::is_constructible<value_type, P&&>::value` is true.

### 23.4.5.4 multimap specialized algorithms

[multimap.special]

```
template <class Key, class T, class Compare, class Allocator>
    void swap(multimap<Key, T, Compare, Allocator>& x,
             multimap<Key, T, Compare, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
```

1 *Effects:* As if by `x.swap(y)`.

## 23.4.6 Class template set

[set]

### 23.4.6.1 Class template set overview

[set.overview]

1 A **set** is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The **set** class supports bidirectional iterators.

2 A **set** satisfies all of the requirements of a container, of a reversible container (23.2), of an associative container (23.2.4), and of an allocator-aware container (Table 106). A **set** also provides most operations described in (23.2.4) for unique keys. This means that a **set** supports the `a_uniq` operations in (23.2.4) but not the `a_eq` operations. For a `set<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on **set** that are not described in one of these tables and for operations where there is additional semantic information.

```
namespace std {
    template <class Key, class Compare = less<Key>,
             class Allocator = allocator<Key>>
    class set {
    public:
        // types:
        typedef Key          key_type;
        typedef Key          value_type;
        typedef Compare      key_compare;
        typedef Compare      value_compare;
```

```

typedef Allocator allocator_type;
typedef value_type& reference;
typedef const value_type& const_reference;
typedef implementation-defined iterator; // see 23.2
typedef implementation-defined const_iterator; // see 23.2
typedef implementation-defined size_type; // see 23.2
typedef implementation-defined difference_type; // see 23.2
typedef typename allocator_traits<Allocator>::pointer pointer;
typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
typedef std::reverse_iterator<iterator> reverse_iterator;
typedef std::reverse_iterator<const_iterator> const_reverse_iterator;

```

// 23.4.6.2, construct/copy/destroy:

```

set() : set(Compare()) { }
explicit set(const Compare& comp, const Allocator& = Allocator());

}

```

#### 23.4.6.2 set constructors, copy, and assignment

[set.cons]

```
explicit set(const Compare& comp, const Allocator& = Allocator());
```

- 1 *Effects:* Constructs an empty set using the specified comparison objects and allocator.
- 2 *Complexity:* Constant.

```

template <class InputIterator>
    set(InputIterator first, InputIterator last,
        const Compare& comp = Compare(), const Allocator& = Allocator());

```

- 3 *Effects:* Constructs an empty `set` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.
- 4 *Complexity:* Linear in  $N$  if the range `[first, last)` is already sorted using `comp` and otherwise  $N \log N$ , where  $N$  is `last - first`.

#### 23.4.6.3 set specialized algorithms

[set.special]

```

template <class Key, class Compare, class Allocator>
    void swap(set<Key, Compare, Allocator>& x,
              set<Key, Compare, Allocator>& y)
        noexcept(noexcept(x.swap(y)));

```

- 1 *Effects:* As if by `x.swap(y)`.

### 23.4.7 Class template multiset

[multiset]

#### 23.4.7.1 Class template multiset overview

[multiset.overview]

- 1 A `multiset` is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.

- <sup>2</sup> A `multiset` satisfies all of the requirements of a container, of a reversible container (23.2), of an associative container (23.2.4), and of an allocator-aware container (Table 106). `multiset` also provides most operations described in (23.2.4) for duplicate keys. This means that a `multiset` supports the `a_eq` operations in (23.2.4) but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

```

namespace std {
    template <class Key, class Compare = less<Key>,
              class Allocator = allocator<Key>>
    class multiset {
    public:
        // types:
        typedef Key                key_type;
        typedef Key                value_type;
        typedef Compare            key_compare;
        typedef Compare            value_compare;
        typedef Allocator          allocator_type;
        typedef value_type&        reference;
        typedef const value_type&  const_reference;

}

```

### 23.4.7.2 multiset constructors

[multiset.cons]

```
explicit multiset(const Compare& comp, const Allocator& = Allocator());
```

<sup>1</sup> *Effects:* Constructs an empty set using the specified comparison object and allocator.

<sup>2</sup> *Complexity:* Constant.

```
template <class InputIterator>
    multiset(InputIterator first, InputIterator last,
             const Compare& comp = Compare(), const Allocator& = Allocator());
```

<sup>3</sup> *Effects:* Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range [first, last).

- 4 *Complexity:* Linear in  $N$  if the range  $[\text{first}, \text{last})$  is already sorted using `comp` and otherwise  $N \log N$ , where  $N$  is  $\text{last} - \text{first}$ .

### 23.4.7.3 multiset specialized algorithms

[multiset.special]

```
template <class Key, class Compare, class Allocator>
void swap(multiset<Key, Compare, Allocator>& x,
          multiset<Key, Compare, Allocator>& y)
    noexcept(noexcept(x.swap(y)));
```

- 1 *Effects:* As if by `x.swap(y)`.

## 23.5 Unordered associative containers

[unord]

### 23.5.1 In general

[unord.general]

- 1 The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.

### 23.5.2 Header `<unordered_map>` synopsis

[unord.map.syn]

```
#include <initializer_list>

namespace std {
    // 23.5.4, class template unordered_map:
    template <class Key,
              class T,
              class Hash = hash<Key>,
              class Pred = std::equal_to<Key>,
              class Alloc = std::allocator<std::pair<const Key, T>>>
    class unordered_map;

    // 23.5.5, class template unordered_multimap:
    template <class Key,
              class T,
              class Hash = hash<Key>,
              class Pred = std::equal_to<Key>,
              class Alloc = std::allocator<std::pair<const Key, T>>>
    class unordered_multimap;

    template <class Key, class T, class Hash, class Pred, class Alloc>

## 23.5.4 Class template unordered\_map

[unord.map]

### 23.5.4.1 Class template unordered\_map overview

[unord.map.overview]

- <sup>1</sup> An `unordered_map` is an unordered associative container that supports unique keys (an `unordered_map` contains at most one of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_map` class supports forward iterators.
- <sup>2</sup> An `unordered_map` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 106). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_map` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_map<Key, T>` the `key` type is `Key`, the mapped type is `T`, and the value type is `std::pair<const Key, T>`.
- <sup>3</sup> This section only describes operations on `unordered_map` that are not described in one of the requirement tables, or for which there is additional semantic information.

```

namespace std {
    template <class Key,
              class T,
              class Hash = hash<Key>,
              class Pred = std::equal_to<Key>,
              class Allocator = std::allocator<std::pair<const Key, T>>>
    class unordered_map {
    public:
        // types:
        typedef Key                key_type;
        typedef std::pair<const Key, T> value_type;
        typedef T                  mapped_type;
        typedef Hash               hasher;
        typedef Pred               key_equal;
        typedef Allocator           allocator_type;
    };
}

```

```

typedef typename allocator_traits<Allocator>::pointer      pointer;
typedef typename allocator_traits<Allocator>::const_pointer const_pointer;

    bool operator!=(const unordered_map<Key, T, Hash, Pred, Alloc>& a,
                    const unordered_map<Key, T, Hash, Pred, Alloc>& b);

// 23.5.4.5, swap:
template <class Key, class T, class Hash, class Pred, class Alloc>
    void swap(unordered_map<Key, T, Hash, Pred, Alloc>& x,
              unordered_map<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));
}

```

#### 23.5.4.2 unordered\_map constructors

[unord.map.cnstr]

```
unordered_map() : unordered_map(size_type(see below)) { }
```

```
explicit unordered_map(size_type n,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());
```

1 *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

2 *Complexity:* Constant.

```
template <class InputIterator>
    unordered_map(InputIterator f, InputIterator l,
                  size_type n = see below,
                  const hasher& hf = hasher(),
                  const key_equal& eql = key_equal(),
                  const allocator_type& a = allocator_type());
unordered_map(initializer_list<value_type> il,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
              const allocator_type& a = allocator_type());
```

3 *Effects:* Constructs an empty `unordered_map` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

4 *Complexity:* Average case linear, worst case quadratic.

#### 23.5.4.3 `unordered_map` element access

[unord.map.elem]

```
mapped_type& operator[](const key_type& k);
```

1 *Effects:* Equivalent to: `return try_emplace(k).first->second;`

```
mapped_type& operator[](key_type&& k);
```

2 *Effects:* Equivalent to: `return try_emplace(move(k)).first->second;`

```
mapped_type& at(const key_type& k);
const mapped_type& at(const key_type& k) const;
```

3 *Returns:* A reference to `x.second`, where `x` is the (unique) element whose key is equivalent to `k`.

4 *Throws:* An exception object of type `out_of_range` if no such element is present.

#### 23.5.4.4 `unordered_map` modifiers

[unord.map.modifiers]

```
template <class P>
    pair<iterator, bool> insert(P&& obj);
```

1 *Effects:* Equivalent to: `return emplace(std::forward<P>(obj));`

2 *Remarks:* This signature shall not participate in overload resolution unless `std::is_constructible<value_type, P&&>::value` is true.

```
template <class P>
    iterator insert(const_iterator hint, P&& obj);
```

3 *Effects:* Equivalent to: `return.emplace_hint(hint, std::forward<P>(obj));`

4 *Remarks:* This signature shall not participate in overload resolution unless `std::is_constructible<value_type, P&&>::value` is true.

```
template <class... Args> pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template <class... Args> iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

5 *Requires:* `value_type` shall be `EmplaceConstructible` into `unordered_map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(forward<Args>(args)...)...`.

6 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(forward<Args>(args)...)...`.

7 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

8 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template <class... Args> pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template <class... Args> iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

9 *Requires:* `value_type` shall be `EmplaceConstructible` into `unordered_map` from `piecewise_construct`, `forward_as_tuple(move(k))`, `forward_as_tuple(forward<Args>(args)...)...`.

10 *Effects:* If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(move(k))`, `forward_as_tuple(forward<Args>(args)...)...`.

11 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

12 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template <class M> pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template <class M> iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
```

13 *Requires:* `is_assignable<mapped_type&, M&&>::value` shall be true. `value_type` shall be `EmplaceConstructible` into `unordered_map` from `k`, `forward<M>(obj)`.

14 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `k`, `forward<M>(obj)`.

15 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

16 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

```
template <class M> pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template <class M> iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

17 *Requires:* `is_assignable<mapped_type&, M&&>::value` shall be true. `value_type` shall be `EmplaceConstructible` into `unordered_map` from `move(k)`, `forward<M>(obj)`.

18 *Effects:* If the map already contains an element `e` whose key is equivalent to `k`, assigns `forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `move(k)`, `forward<M>(obj)`.

19 *Returns:* In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

20 *Complexity:* The same as `emplace` and `emplace_hint`, respectively.

**23.5.4.5 unordered\_map swap****[unord.map.swap]**

```
template <class Key, class T, class Hash, class Pred, class Alloc>
void swap(unordered_map<Key, T, Hash, Pred, Alloc>& x,
         unordered_map<Key, T, Hash, Pred, Alloc>& y)
    noexcept(noexcept(x.swap(y)));
```

<sup>1</sup> *Effects:* As if by `x.swap(y)`.

**23.5.5 Class template unordered\_multimap****[unord.multimap]****23.5.5.1 Class template unordered\_multimap overview****[unord.multimap.overview]**

- <sup>1</sup> An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.
- <sup>2</sup> An `unordered_multimap` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 106). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `std::pair<const Key, T>`.
- <sup>3</sup> This section only describes operations on `unordered_multimap` that are not described in one of the requirements tables, or for which there is additional semantic information.

};

template <class Key, class T, class Hash, class Pred, class Alloc>
    bool operator==(const unordered_multimap<Key, T, Hash, Pred, Alloc>& a,

```

```

        const unordered_multimap<Key, T, Hash, Pred, Alloc>& b);
template <class Key, class T, class Hash, class Pred, class Alloc>
    bool operator!=(const unordered_multimap<Key, T, Hash, Pred, Alloc>& a,
        const unordered_multimap<Key, T, Hash, Pred, Alloc>& b);

```

// 23.5.5.4, swap:

```

template <class Key, class T, class Hash, class Pred, class Alloc>
    void swap(unordered_multimap<Key, T, Hash, Pred, Alloc>& x,
        unordered_multimap<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));

```

```

}

```

### 23.5.5.2 unordered\_multimap constructors

[unord.multimap.cnstr]

```

unordered_multimap() : unordered_multimap(size_type(see below)) { }
explicit unordered_multimap(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

```

1 *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

2 *Complexity:* Constant.

```

template <class InputIterator>
    unordered_multimap(InputIterator f, InputIterator l,
        size_type n = see below,
        const hasher& hf = hasher(),
        const key_equal& eql = key_equal(),
        const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

```

3 *Effects:* Constructs an empty `unordered_multimap` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

4 *Complexity:* Average case linear, worst case quadratic.

### 23.5.5.3 unordered\_multimap modifiers

[unord.multimap.modifiers]

```

template <class P>
    iterator insert(P&& obj);

```

1 *Effects:* Equivalent to: `return.emplace(std::forward<P>(obj));`

2 *Remarks:* This signature shall not participate in overload resolution unless `std::is_constructible<value_type, P&&>::value` is true.

```

template <class P>
    iterator insert(const_iterator hint, P&& obj);

```

- 3 *Effects:* Equivalent to: `return.emplace_hint(hint, std::forward<P>(obj));`
- 4 *Remarks:* This signature shall not participate in overload resolution unless `std::is_constructible<value_type, P&&>::value` is true.

#### 23.5.5.4 unordered\_multimap swap

[unord.multimap.swap]

```
template <class Key, class T, class Hash, class Pred, class Alloc>
void swap(unordered_multimap<Key, T, Hash, Pred, Alloc>& x,
         unordered_multimap<Key, T, Hash, Pred, Alloc>& y)
noexcept(noexcept(x.swap(y)));
```

- 1 *Effects:* As if by `x.swap(y)`.

### 23.5.6 Class template unordered\_set

[unord.set]

#### 23.5.6.1 Class template unordered\_set overview

[unord.set.overview]

- 1 An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements' keys are the elements themselves. The `unordered_set` class supports forward iterators.
- 2 An `unordered_set` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 106). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_set<Key>` the `key` type and the value type are both `Key`. The `iterator` and `const_iterator` types are both `const` iterator types. It is unspecified whether they are the same type.
- 3 This section only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template <class Key,
              class Hash = hash<Key>,
              class Pred = std::equal_to<Key>,
              class Allocator = std::allocator<Key>>
    class unordered_set {
    public:
        // types:
        typedef Key                key_type;
        typedef Key                value_type;
        typedef Hash               hasher;
        typedef Pred               key_equal;
        typedef Allocator          allocator_type;
        typedef typename allocator_traits<Allocator>::pointer      pointer;
        typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
        typedef value_type&        reference;
        typedef const value_type&  const_reference;
        typedef implementation-defined      size_type;
        typedef implementation-defined      difference_type;

        typedef implementation-defined      iterator;
        typedef implementation-defined      const_iterator;
        typedef implementation-defined      local_iterator;
        typedef implementation-defined      const_local_iterator;

        // 23.5.6.2, construct/copy/destroy:
        unordered_set();
```

```

```

// 23.5.6.3, swap:

```

template <class Key, class Hash, class Pred, class Alloc>
    void swap(unordered_set<Key, Hash, Pred, Alloc>& x,
              unordered_set<Key, Hash, Pred, Alloc>& y)
    noexcept(noexcept(x.swap(y)));
}

```

### 23.5.6.2 unordered\_set constructors

[unord.set.cnstr]

```

unordered_set() : unordered_set(size_type(see below)) { }
explicit unordered_set(size_type n,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());

```

1 *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

2 *Complexity:* Constant.

```

template <class InputIterator>
    unordered_set(InputIterator f, InputIterator l,
                  size_type n = see below,
                  const hasher& hf = hasher(),
                  const key_equal& eql = key_equal(),
                  const allocator_type& a = allocator_type());
unordered_set(initializer_list<value_type> il,
              size_type n = see below,
              const hasher& hf = hasher(),
              const key_equal& eql = key_equal(),
              const allocator_type& a = allocator_type());

```

3 *Effects:* Constructs an empty `unordered_set` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

4 *Complexity:* Average case linear, worst case quadratic.

### 23.5.6.3 unordered\_set swap

[unord.set.swap]

```

template <class Key, class Hash, class Pred, class Alloc>
    void swap(unordered_set<Key, Hash, Pred, Alloc>& x,
              unordered_set<Key, Hash, Pred, Alloc>& y)
    noexcept(noexcept(x.swap(y)));

```

1 *Effects:* As if by `x.swap(y)`.

## 23.5.7 Class template `unordered_multiset` [unord.multiset]

### 23.5.7.1 Class template `unordered_multiset` overview [unord.multiset.overview]

- <sup>1</sup> An `unordered_multiset` is an unordered associative container that supports equivalent keys (an instance of `unordered_multiset` may contain multiple copies of the same key value) and in which each element's key is the element itself. The `unordered_multiset` class supports forward iterators.
- <sup>2</sup> An `unordered_multiset` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 106). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multiset` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multiset<Key>` the `key_type` and the value type are both `Key`. The `iterator` and `const_iterator` types are both `const` iterator types. It is unspecified whether they are the same type.
- <sup>3</sup> This section only describes operations on `unordered_multiset` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template <class Key,
              class Hash = hash<Key>,
              class Pred = std::equal_to<Key>,
              class Allocator = std::allocator<Key>>
    class unordered_multiset {
    public:
        // types:
        typedef Key                key_type;
        typedef Key                value_type;
        typedef Hash               hasher;
        typedef Pred               key_equal;
        typedef Allocator          allocator_type;
        typedef typename allocator_traits<Allocator>::pointer      pointer;
        typedef typename allocator_traits<Allocator>::const_pointer const_pointer;
        typedef value_type&        reference;
        typedef const value_type&  const_reference;
        typedef implementation-defined      size_type;
        typedef implementation-defined      difference_type;

        typedef implementation-defined      iterator;
        typedef implementation-defined      const_iterator;
        typedef implementation-defined      local_iterator;
        typedef implementation-defined      const_local_iterator;

        // 23.5.7.2, construct/copy/destroy:
        unordered_multiset();

template <class Key, class Hash, class Pred, class Alloc>
    bool operator==(const unordered_multiset<Key, Hash, Pred, Alloc>& a,
                   const unordered_multiset<Key, Hash, Pred, Alloc>& b);
template <class Key, class Hash, class Pred, class Alloc>
    bool operator!=(const unordered_multiset<Key, Hash, Pred, Alloc>& a,
                   const unordered_multiset<Key, Hash, Pred, Alloc>& b);

    // 23.5.7.3, swap:
    template <class Key, class Hash, class Pred, class Alloc>
        void swap(unordered_multiset<Key, Hash, Pred, Alloc>& x,
                 unordered_multiset<Key, Hash, Pred, Alloc>& y)
            noexcept(noexcept(x.swap(y)));
}

```

**23.5.7.2 unordered\_multiset constructors****[unord.multiset.cnstr]**

```
unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
                           const hasher& hf = hasher(),
                           const key_equal& eql = key_equal(),
                           const allocator_type& a = allocator_type());
```

<sup>1</sup> *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

<sup>2</sup> *Complexity:* Constant.

```
template <class InputIterator>
    unordered_multiset(InputIterator f, InputIterator l,
                      size_type n = see below,
                      const hasher& hf = hasher(),
                      const key_equal& eql = key_equal(),
                      const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
                  size_type n = see below,
                  const hasher& hf = hasher(),
                  const key_equal& eql = key_equal(),
                  const allocator_type& a = allocator_type());
```

<sup>3</sup> *Effects:* Constructs an empty `unordered_multiset` using the specified hash function, key equality function, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

<sup>4</sup> *Complexity:* Average case linear, worst case quadratic.

**23.5.7.3 unordered\_multiset swap****[unord.multiset.swap]**

```
template <class Key, class Hash, class Pred, class Alloc>
    void swap(unordered_multiset<Key, Hash, Pred, Alloc>& x,
             unordered_multiset<Key, Hash, Pred, Alloc>& y)
    noexcept(noexcept(x.swap(y)));
```

<sup>1</sup> *Effects:* As if by `x.swap(y)`.

**23.6 Container adaptors****[container.adaptors]****23.6.1 In general****[container.adaptors.general]**

- <sup>1</sup> The headers `<queue>` and `<stack>` define the container adaptors `queue`, `priority_queue`, and `stack`.
- <sup>2</sup> The container adaptors each take a `Container` template parameter, and each constructor takes a `Container` reference argument. This container is copied into the `Container` member of each adaptor. If the container takes an allocator, then a compatible allocator may be passed in to the adaptor's constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter `T` of the container adaptors shall denote the same type as `Container::value_type`.
- <sup>3</sup> For container adaptors, no `swap` function throws an exception unless that exception is thrown by the swap of the adaptor's `Container` or `Compare` object (if any).

**23.6.2 Header `<queue>` synopsis****[queue.syn]**

```

#include <initializer_list>

namespace std {
    template <class T, class Container = deque<T>> class queue;
    template <class T, class Container = vector<T>,
              class Compare = less<typename Container::value_type>>
        class priority_queue;

    template <class T, class Container>
        bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
    template <class T, class Container>
        bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
    template <class T, class Container>
        bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
    template <class T, class Container>
        bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
    template <class T, class Container>
        bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);
    template <class T, class Container>
        bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);

    template <class T, class Container>
        void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
    template <class T, class Container, class Compare>
        void swap(priority_queue<T, Container, Compare>& x,
                  priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
}

```

### 23.6.3 Header <stack> synopsis

[stack.syn]

```

#include <initializer_list>

namespace std {
    template <class T, class Container = deque<T>> class stack;
    template <class T, class Container>
        bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
}

```

### 23.6.4 Class template queue

[queue]

#### 23.6.4.1 queue definition

[queue.defn]

- <sup>1</sup> Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate queue. In particular, list (23.3.10) and deque (23.3.8) can be used.

```

namespace std {

```

```

template <class T, class Container = deque<T>>
class queue {
public:
    typedef typename Container::value_type      value_type;
    typedef typename Container::reference       reference;
    typedef typename Container::const_reference const_reference;
    typedef typename Container::size_type      size_type;
    typedef Container                          container_type;

protected:
    Container c;

public:
    explicit queue(const Container&);
    explicit queue(Container&& = Container());
    template <class Alloc> explicit queue(const Alloc&);
    template <class Alloc> queue(const Container&, const Alloc&);
    template <class Alloc> queue(Container&&, const Alloc&);
    template <class Alloc> queue(const queue&, const Alloc&);
    template <class Alloc> queue(queue&&, const Alloc&);

    bool          empty() const      { return c.empty(); }
    size_type     size()  const      { return c.size(); }
    reference     front()             { return c.front(); }
    const_reference front() const     { return c.front(); }
    reference     back()             { return c.back(); }
    const_reference back() const      { return c.back(); }
    void push(const value_type& x)    { c.push_back(x); }
    void push(value_type&& x)         { c.push_back(std::move(x)); }
    template <class... Args>
        void emplace(Args&&... args) { c.emplace_back(std::forward<Args>(args)...); }
    void pop()                        { c.pop_front(); }
    void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
        { using std::swap; swap(c, q.c); }
};

template <class T, class Container>
    bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
template <class T, class Container>
    bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
template <class T, class Container>
    bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
template <class T, class Container>
    bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
template <class T, class Container>
    bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);
template <class T, class Container>
    bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);

template <class T, class Container>
    void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

template <class T, class Container, class Alloc>
    struct uses_allocator<queue<T, Container>, Alloc>
        : uses_allocator<Container, Alloc>::type { };

```

}

#### 23.6.4.2 queue constructors

[queue.cons]

```
explicit queue(const Container& cont);
```

1 *Effects:* Initializes c with cont.

```
explicit queue(Container&& cont = Container());
```

2 *Effects:* Initializes c with std::move(cont).

#### 23.6.4.3 queue constructors with allocators

[queue.cons.alloc]

1 If uses\_allocator<container\_type, Alloc>::value is false the constructors in this subclause shall not participate in overload resolution.

```
template <class Alloc> explicit queue(const Alloc& a);
```

2 *Effects:* Initializes c with a.

```
template <class Alloc> queue(const container_type& cont, const Alloc& a);
```

3 *Effects:* Initializes c with cont as the first argument and a as the second argument.

```
template <class Alloc> queue(container_type&& cont, const Alloc& a);
```

4 *Effects:* Initializes c with std::move(cont) as the first argument and a as the second argument.

```
template <class Alloc> queue(const queue& q, const Alloc& a);
```

5 *Effects:* Initializes c with q.c as the first argument and a as the second argument.

```
template <class Alloc> queue(queue&& q, const Alloc& a);
```

6 *Effects:* Initializes c with std::move(q.c) as the first argument and a as the second argument.

#### 23.6.4.4 queue operators

[queue.ops]

```
template <class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
```

1 *Returns:* x.c == y.c.

```
template <class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
```

2 *Returns:* x.c != y.c.

```
template <class T, class Container>
bool operator< (const queue<T, Container>& x, const queue<T, Container>& y);
```

3 *Returns:* x.c < y.c.

```
template <class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
```

4 *Returns:* x.c <= y.c.

```
template <class T, class Container>
bool operator> (const queue<T, Container>& x, const queue<T, Container>& y);
```

5 *Returns:* `x.c > y.c`.

```
template <class T, class Container>
    bool operator>=(const queue<T, Container>& x,
                    const queue<T, Container>& y);
```

6 *Returns:* `x.c >= y.c`.

#### 23.6.4.5 queue specialized algorithms

[queue.special]

```
template <class T, class Container>
    void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

1 *Remarks:* This function shall not participate in overload resolution unless `is_swappable_v<Container>` is true.

2 *Effects:* As if by `x.swap(y)`.

#### 23.6.5 Class template priority\_queue

[priority.queue]

1 Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (23.3.11) and `deque` (23.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (25.5).

```
namespace std {
    template <class T, class Container = vector<T>,
              class Compare = less<typename Container::value_type>>
    class priority_queue {
    public:
        typedef typename Container::value_type          value_type;
        typedef typename Container::reference            reference;
        typedef typename Container::const_reference      const_reference;
        typedef typename Container::size_type            size_type;
        typedef Container                                container_type;

    protected:
        Container c;
        Compare comp;

    public:
        priority_queue(const Compare& x, const Container&);
        explicit priority_queue(const Compare& x = Compare(), Container&& = Container());
        template <class InputIterator>
            priority_queue(InputIterator first, InputIterator last,
                           const Compare& x, const Container&);
        template <class InputIterator>
            priority_queue(InputIterator first, InputIterator last,
                           const Compare& x = Compare(), Container&& = Container());
        template <class Alloc> explicit priority_queue(const Alloc&);
        template <class Alloc> priority_queue(const Compare&, const Alloc&);
        template <class Alloc> priority_queue(const Compare&, const Container&, const Alloc&);
        template <class Alloc> priority_queue(const Compare&, Container&&, const Alloc&);
        template <class Alloc> priority_queue(const priority_queue&, const Alloc&);
        template <class Alloc> priority_queue(priority_queue&&, const Alloc&);

        bool empty() const { return c.empty(); }
    };
}
```

```

    size_type size() const { return c.size(); }
    const_reference top() const { return c.front(); }
    void push(const value_type& x);
    void push(value_type&& x);
    template <class... Args> void emplace(Args&&... args);
    void pop();
    void swap(priority_queue& q) noexcept(is_nothrow_swappable_v<Container> &&
                                         is_nothrow_swappable_v<Compare>)
        { using std::swap; swap(c, q.c); swap(comp, q.comp); }
};

// no equality is provided

template <class T, class Container, class Compare>
    void swap(priority_queue<T, Container, Compare>& x,
              priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

template <class T, class Container, class Compare, class Alloc>
    struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>
        : uses_allocator<Container, Alloc>::type { };
}

```

### 23.6.5.1 priority\_queue constructors

[priqueue.cons]

```

priority_queue(const Compare& x, const Container& y);
explicit priority_queue(const Compare& x = Compare(), Container&& y = Container());

```

- 1 *Requires:* x shall define a strict weak ordering (25.5).
- 2 *Effects:* Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls make\_heap(c.begin(), c.end(), comp).

```

template <class InputIterator>
    priority_queue(InputIterator first, InputIterator last,
                  const Compare& x,
                  const Container& y);
template <class InputIterator>
    priority_queue(InputIterator first, InputIterator last,
                  const Compare& x = Compare(),
                  Container&& y = Container());

```

- 3 *Requires:* x shall define a strict weak ordering (25.5).
- 4 *Effects:* Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls c.insert(c.end(), first, last); and finally calls make\_heap(c.begin(), c.end(), comp).

### 23.6.5.2 priority\_queue constructors with allocators

[priqueue.cons.alloc]

- 1 If uses\_allocator<container\_type, Alloc>::value is false the constructors in this subclause shall not participate in overload resolution.

```

template <class Alloc> explicit priority_queue(const Alloc& a);

```

- 2 *Effects:* Initializes c with a and value-initializes comp.

```

template <class Alloc> priority_queue(const Compare& compare, const Alloc& a);

```

- 3 *Effects:* Initializes c with a and initializes comp with compare.

```

template <class Alloc>
    priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
4     Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp
        with compare; calls make_heap(c.begin(), c.end(), comp).

template <class Alloc>
    priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
5     Effects: Initializes c with std::move(cont) as the first argument and a as the second argument, and
        initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

template <class Alloc> priority_queue(const priority_queue& q, const Alloc& a);
6     Effects: Initializes c with q.c as the first argument and a as the second argument, and initializes comp
        with q.comp.

template <class Alloc> priority_queue(priority_queue&& q, const Alloc& a);
7     Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument, and
        initializes comp with std::move(q.comp).

```

### 23.6.5.3 priority\_queue members [priority\_queue.members]

```

void push(const value_type& x);
1     Effects: As if by:
        c.push_back(x);
        push_heap(c.begin(), c.end(), comp);

void push(value_type&& x);
2     Effects: As if by:
        c.push_back(std::move(x));
        push_heap(c.begin(), c.end(), comp);

template <class... Args> void emplace(Args&&... args)
3     Effects: As if by:
        c.emplace_back(std::forward<Args>(args)...);
        push_heap(c.begin(), c.end(), comp);

void pop();
4     Effects: As if by:
        pop_heap(c.begin(), c.end(), comp);
        c.pop_back();

```

### 23.6.5.4 priority\_queue specialized algorithms [priority\_queue.special]

```

template <class T, class Container, class Compare>
    void swap(priority_queue<T, Container, Compare>& x,
              priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
1     Remarks: This function shall not participate in overload resolution unless is_swappable_v<Container>
        is true and is_swappable_v<Compare> is true.
2     Effects: As if by x.swap(y).

```

**23.6.6 Class template stack****[stack]**

- <sup>1</sup> Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate `stack`. In particular, `vector` (23.3.11), `list` (23.3.10) and `deque` (23.3.8) can be used.

**23.6.6.1 stack definition****[stack.defn]**

```

namespace std {
    template <class T, class Container = deque<T>>
    class stack {
    public:
        typedef typename Container::value_type      value_type;
        typedef typename Container::reference        reference;
        typedef typename Container::const_reference  const_reference;
        typedef typename Container::size_type        size_type;
        typedef Container                            container_type;

    protected:
        Container c;

    public:
        explicit stack(const Container&);
        explicit stack(Container&& = Container());
        template <class Alloc> explicit stack(const Alloc&);
        template <class Alloc> stack(const Container&, const Alloc&);
        template <class Alloc> stack(Container&&, const Alloc&);
        template <class Alloc> stack(const stack&, const Alloc&);
        template <class Alloc> stack(stack&&, const Alloc&);

        bool      empty() const           { return c.empty(); }
        size_type size() const             { return c.size(); }
        reference  top()                   { return c.back(); }
        const_reference top() const        { return c.back(); }
        void push(const value_type& x)     { c.push_back(x); }
        void push(value_type&& x)           { c.push_back(std::move(x)); }
        template <class... Args>
            void emplace(Args&&... args)   { c.emplace_back(std::forward<Args>(args)...); }
        void pop()                         { c.pop_back(); }
        void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
            { using std::swap; swap(c, s.c); }
    };

    template <class T, class Container>
        bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator>= (const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        bool operator<= (const stack<T, Container>& x, const stack<T, Container>& y);
    template <class T, class Container>
        void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));

```

```

    template <class T, class Container, class Alloc>
        struct uses_allocator<stack<T, Container>, Alloc>
            : uses_allocator<Container, Alloc>::type { };
}

```

### 23.6.6.2 stack constructors

[stack.cons]

```
explicit stack(const Container& cont);
```

1 *Effects:* Initializes *c* with *cont*.

```
explicit stack(Container&& cont = Container());
```

2 *Effects:* Initializes *c* with `std::move(cont)`.

### 23.6.6.3 stack constructors with allocators

[stack.cons.alloc]

1 If `uses_allocator<container_type, Alloc>::value` is `false` the constructors in this subclause shall not participate in overload resolution.

```
template <class Alloc> explicit stack(const Alloc& a);
```

2 *Effects:* Initializes *c* with *a*.

```
template <class Alloc> stack(const container_type& cont, const Alloc& a);
```

3 *Effects:* Initializes *c* with *cont* as the first argument and *a* as the second argument.

```
template <class Alloc> stack(container_type&& cont, const Alloc& a);
```

4 *Effects:* Initializes *c* with `std::move(cont)` as the first argument and *a* as the second argument.

```
template <class Alloc> stack(const stack& s, const Alloc& a);
```

5 *Effects:* Initializes *c* with *s.c* as the first argument and *a* as the second argument.

```
template <class Alloc> stack(stack&& s, const Alloc& a);
```

6 *Effects:* Initializes *c* with `std::move(s.c)` as the first argument and *a* as the second argument.

### 23.6.6.4 stack operators

[stack.ops]

```

template <class T, class Container>
    bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);

```

1 *Returns:* *x.c* == *y.c*.

```

template <class T, class Container>
    bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);

```

2 *Returns:* *x.c* != *y.c*.

```

template <class T, class Container>
    bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);

```

3 *Returns:* *x.c* < *y.c*.

```

template <class T, class Container>
    bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);

```

4 *Returns:* *x.c* <= *y.c*.

```
template <class T, class Container>
    bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
```

5       *Returns:* `x.c > y.c`.

```
template <class T, class Container>
    bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
```

6       *Returns:* `x.c >= y.c`.

### 23.6.6.5 stack specialized algorithms

[stack.special]

```
template <class T, class Container>
    void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
```

1       *Remarks:* This function shall not participate in overload resolution unless `is_swappable_v<Container>` is `true`.

2       *Effects:* As if by `x.swap(y)`.

## 24 Iterators library

[iterators]

### 24.1 General

[iterators.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform iterations over containers (Clause 23), streams (27.7), and stream buffers (27.6).
- <sup>2</sup> The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 111.

Table 111 — Iterators library summary

| Subclause                                 | Header(s)                     |
|-------------------------------------------|-------------------------------|
| <a href="#">24.2</a> Requirements         |                               |
| <a href="#">24.4</a> Iterator primitives  | <code>&lt;iterator&gt;</code> |
| <a href="#">24.5</a> Predefined iterators |                               |
| <a href="#">24.6</a> Stream iterators     |                               |

### 24.2 Iterator requirements

[iterator.requirements]

#### 24.2.1 In general

[iterator.requirements.general]

- <sup>1</sup> Iterators are a generalization of pointers that allow a C++ program to work with different data structures (containers) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. All input iterators *i* support the expression *\*i*, resulting in a value of some object type *T*, called the *value type* of the iterator. All output iterators support the expression *\*i = o* where *o* is a value of some type that is in the set of types that are *writable* to the particular iterator type of *i*. All iterators *i* for which the expression *(\*i).m* is well-defined, support the expression *i->m* with the same semantics as *(\*i).m*. For every iterator type *X* for which equality is defined, there is a corresponding signed integer type called the *difference type* of the iterator.
- <sup>2</sup> Since iterators are an abstraction of pointers, their semantics is a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This International Standard defines five categories of iterators, according to the operations defined on them: *input iterators*, *output iterators*, *forward iterators*, *bidirectional iterators* and *random access iterators*, as shown in Table 112.

Table 112 — Relations among iterator categories

|                      |   |                      |   |                |   |               |
|----------------------|---|----------------------|---|----------------|---|---------------|
| <b>Random Access</b> | → | <b>Bidirectional</b> | → | <b>Forward</b> | → | <b>Input</b>  |
|                      |   |                      |   |                | → | <b>Output</b> |

- <sup>3</sup> Forward iterators satisfy all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also satisfy all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also satisfy all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified.
- <sup>4</sup> Iterators that further satisfy the requirements of output iterators are called *mutable iterators*. Nonmutable iterators are referred to as *constant iterators*.

- 5 Iterators that further satisfy the requirement that, for integral values `n` and dereferenceable iterator values `a` and `(a + n)`, `*(a + n)` is equivalent to `*(addressof(*a) + n)`, are called *contiguous iterators*. [Note: For example, the type “pointer to int” is a contiguous iterator, but `reverse_iterator<int*>` is not. For a valid iterator range `[a,b)` with dereferenceable `a`, the corresponding range denoted by pointers is `[addressof(*a),addressof(*a) + (b - a))`; `b` might not be dereferenceable. — end note]
- 6 Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. These values are called *past-the-end* values. Values of an iterator `i` for which the expression `*i` is defined are called *dereferenceable*. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. [Example: After the declaration of an uninitialized pointer `x` (as with `int* x;`), `x` must always be assumed to have a singular value of a pointer. — end example] Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that satisfy the **DefaultConstructible** requirements, using a value-initialized iterator as the source of a copy or move operation. [Note: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note] In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.
- 7 An iterator `j` is called *reachable* from an iterator `i` if and only if there is a finite sequence of applications of the expression `++i` that makes `i == j`. If `j` is reachable from `i`, they refer to elements of the same sequence.
- 8 Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A *range* is a pair of iterators that designate the beginning and end of the computation. A range `[i, i)` is an empty range; in general, a range `[i, j)` refers to the elements in the data structure starting with the element pointed to by `i` and up to but not including the element pointed to by `j`. Range `[i, j)` is valid if and only if `j` is reachable from `i`. The result of the application of functions in the library to invalid ranges is undefined.
- 9 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables for the iterators do not have a complexity column.
- 10 Destruction of an iterator may invalidate pointers and references previously obtained from that iterator.
- 11 An *invalid* iterator is an iterator that may be singular.<sup>267</sup>
- 12 In the following sections, `a` and `b` denote values of type `X` or `const X`, `difference_type` and `reference` refer to the types `iterator_traits<X>::difference_type` and `iterator_traits<X>::reference`, respectively, `n` denotes a value of `difference_type`, `u`, `tmp`, and `m` denote identifiers, `r` denotes a value of `X&`, `t` denotes a value of value type `T`, `o` denotes a value of some type that is writable to the output iterator. [Note: For an iterator type `X` there must be an instantiation of `iterator_traits<X>` (24.4.1). — end note]

## 24.2.2 Iterator

[iterator.iterators]

- 1 The **Iterator** requirements form the basis of the iterator concept taxonomy; every iterator satisfies the **Iterator** requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (24.2.3) or write (24.2.4) values, or to provide a richer set of iterator movements (24.2.5, 24.2.6, 24.2.7).)
- 2 A type `X` satisfies the **Iterator** requirements if:
  - (2.1) — `X` satisfies the **CopyConstructible**, **CopyAssignable**, and **Destructible** requirements (17.6.3.1) and lvalues of type `X` are swappable (17.6.3.2), and
  - (2.2) — the expressions in Table 113 are valid and have the indicated semantics.

<sup>267</sup>) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.

Table 113 — Iterator requirements

| Expression | Return type   | Operational semantics | Assertion/note pre-/post-condition |
|------------|---------------|-----------------------|------------------------------------|
| <b>*r</b>  | unspecified   |                       | pre: <b>r</b> is dereferenceable.  |
| <b>++r</b> | <b>X&amp;</b> |                       |                                    |

### 24.2.3 Input iterators

[input.iterators]

- <sup>1</sup> A class or pointer type **X** satisfies the requirements of an input iterator for the value type **T** if **X** satisfies the **Iterator** (24.2.2) and **EqualityComparable** (Table 17) requirements and the expressions in Table 114 are valid and have the indicated semantics.
- <sup>2</sup> In Table 114, the term *the domain of ==* is used in the ordinary mathematical sense to denote the set of values over which == is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of == for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of == and !=. [Example: the call **find(a,b,x)** is defined only if the value of **a** has the property *p* defined as follows: **b** has property *p* and a value **i** has property *p* if (**\*i==x**) or if (**\*i!=x** and **++i** has property *p*). — end example]

Table 114 — Input iterator requirements (in addition to Iterator)

| Expression       | Return type                             | Operational semantics                           | Assertion/note pre-/post-condition                                                                                                                                                                                                          |
|------------------|-----------------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a != b</b>    | contextually convertible to <b>bool</b> | <b>!(a == b)</b>                                | pre: ( <b>a</b> , <b>b</b> ) is in the domain of ==.                                                                                                                                                                                        |
| <b>*a</b>        | reference, convertible to <b>T</b>      |                                                 | pre: <b>a</b> is dereferenceable.<br>The expression <b>(void)*a</b> , <b>*a</b> is equivalent to <b>*a</b> .<br>If <b>a == b</b> and ( <b>a</b> , <b>b</b> ) is in the domain of == then <b>*a</b> is equivalent to <b>*b</b> .             |
| <b>a-&gt;m</b>   |                                         | <b>(*a).m</b>                                   | pre: <b>a</b> is dereferenceable.                                                                                                                                                                                                           |
| <b>++r</b>       | <b>X&amp;</b>                           |                                                 | pre: <b>r</b> is dereferenceable.<br>post: <b>r</b> is dereferenceable or <b>r</b> is past-the-end.<br>post: any copies of the previous value of <b>r</b> are no longer required either to be dereferenceable or to be in the domain of ==. |
| <b>(void)r++</b> |                                         |                                                 | equivalent to <b>(void)++r</b>                                                                                                                                                                                                              |
| <b>*r++</b>      | convertible to <b>T</b>                 | <b>{ T tmp = *r;<br/>++r;<br/>return tmp; }</b> |                                                                                                                                                                                                                                             |

- <sup>3</sup> [Note: For input iterators, **a == b** does not imply **++a == ++b**. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on input iterators should never attempt to pass through the same iterator twice. They should be *single pass* algorithms. Value type **T** is not required to be a

CopyAssignable type (Table 23). These algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template. — *end note*]

#### 24.2.4 Output iterators

[**output.iterators**]

- <sup>1</sup> A class or pointer type **X** satisfies the requirements of an output iterator if **X** satisfies the **Iterator** requirements (24.2.2) and the expressions in Table 115 are valid and have the indicated semantics.

Table 115 — Output iterator requirements (in addition to **Iterator**)

| Expression            | Return type                              | Operational semantics                                | Assertion/note pre-/post-condition                                                                                                                           |
|-----------------------|------------------------------------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>*r = o</code>   | result is not used                       |                                                      | <i>Remark:</i> After this operation <b>r</b> is not required to be dereferenceable.<br>post: <b>r</b> is incrementable.                                      |
| <code>++r</code>      | <code>X&amp;</code>                      |                                                      | <code>&amp;r == &amp;++r</code> .<br><i>Remark:</i> After this operation <b>r</b> is not required to be dereferenceable.<br>post: <b>r</b> is incrementable. |
| <code>r++</code>      | convertible to <code>const X&amp;</code> | <code>{ X tmp = r;<br/>++r;<br/>return tmp; }</code> | <i>Remark:</i> After this operation <b>r</b> is not required to be dereferenceable.<br>post: <b>r</b> is incrementable.                                      |
| <code>*r++ = o</code> | result is not used                       |                                                      | <i>Remark:</i> After this operation <b>r</b> is not required to be dereferenceable.<br>post: <b>r</b> is incrementable.                                      |

- <sup>2</sup> [ *Note:* The only valid use of an **operator\*** is on the left side of the assignment statement. *Assignment through the same value of the iterator happens only once.* Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be *single pass* algorithms. Equality and inequality might not be defined. Algorithms that take output iterators can be used with ostream as the destination for placing data through the `ostream_iterator` class as well as with insert iterators and insert pointers. — *end note*]

#### 24.2.5 Forward iterators

[**forward.iterators**]

- <sup>1</sup> A class or pointer type **X** satisfies the requirements of a forward iterator if
- (1.1) — **X** satisfies the requirements of an input iterator (24.2.3),
  - (1.2) — **X** satisfies the **DefaultConstructible** requirements (17.6.3.1),
  - (1.3) — if **X** is a mutable iterator, **reference** is a reference to **T**; if **X** is a const iterator, **reference** is a reference to `const T`,
  - (1.4) — the expressions in Table 116 are valid and have the indicated semantics, and
  - (1.5) — objects of type **X** offer the multi-pass guarantee, described below.
- <sup>2</sup> The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the

same type. [ *Note*: value-initialized iterators behave as if they refer past the end of the same empty sequence — *end note* ]

<sup>3</sup> Two dereferenceable iterators **a** and **b** of type **X** offer the *multi-pass guarantee* if:

(3.1) — **a** == **b** implies ++**a** == ++**b** and

(3.2) — **X** is a pointer type or the expression (void)++**X**(**a**), \***a** is equivalent to the expression \***a**.

<sup>4</sup> [ *Note*: The requirement that **a** == **b** implies ++**a** == ++**b** (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — *end note* ]

Table 116 — Forward iterator requirements (in addition to input iterator)

| Expression   | Return type                        | Operational semantics                                         | Assertion/note pre-/post-condition |
|--------------|------------------------------------|---------------------------------------------------------------|------------------------------------|
| <b>r++</b>   | convertible to<br>const <b>X</b> & | { <b>X</b> tmp = <b>r</b> ;<br>++ <b>r</b> ;<br>return tmp; } |                                    |
| * <b>r++</b> | reference                          |                                                               |                                    |

<sup>5</sup> If **a** and **b** are equal, then either **a** and **b** are both dereferenceable or else neither is dereferenceable.

<sup>6</sup> If **a** and **b** are both dereferenceable, then **a** == **b** if and only if \***a** and \***b** are bound to the same object.

### 24.2.6 Bidirectional iterators

[bidirectional.iterators]

<sup>1</sup> A class or pointer type **X** satisfies the requirements of a bidirectional iterator if, in addition to satisfying the requirements for forward iterators, the following expressions are valid as shown in Table 117.

Table 117 — Bidirectional iterator requirements (in addition to forward iterator)

| Expression   | Return type                        | Operational semantics                                         | Assertion/note pre-/post-condition                                                                                                                                                                                                     |
|--------------|------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -- <b>r</b>  | <b>X</b> &                         |                                                               | pre: there exists <b>s</b> such that<br><b>r</b> == ++ <b>s</b> .<br>post: <b>r</b> is dereferenceable.<br>--(++ <b>r</b> ) == <b>r</b> .<br>-- <b>r</b> == -- <b>s</b> implies <b>r</b> == <b>s</b> .<br>& <b>r</b> == &-- <b>r</b> . |

<sup>2</sup> [ *Note*: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — *end note* ]

### 24.2.7 Random access iterators

[random.access.iterators]

- <sup>1</sup> A class or pointer type *X* satisfies the requirements of a random access iterator if, in addition to satisfying the requirements for bidirectional iterators, the following expressions are valid as shown in Table 118.

Table 118 — Random access iterator requirements (in addition to bidirectional iterator)

| Expression                               | Return type                                     | Operational semantics                                                                                                           | Assertion/note pre-/post-condition                                                                     |
|------------------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>r += n</code>                      | <code>X&amp;</code>                             | <pre>{ difference_type m = n;   if (m &gt;= 0)     while (m--)       ++r;   else     while (m++)       --r;   return r; }</pre> |                                                                                                        |
| <code>a + n</code><br><code>n + a</code> | <code>X</code>                                  | <pre>{ X tmp = a;   return tmp += n; }</pre>                                                                                    | <code>a + n == n + a.</code>                                                                           |
| <code>r -= n</code>                      | <code>X&amp;</code>                             | <code>return r += -n;</code>                                                                                                    |                                                                                                        |
| <code>a - n</code>                       | <code>X</code>                                  | <pre>{ X tmp = a;   return tmp -= n; }</pre>                                                                                    |                                                                                                        |
| <code>b - a</code>                       | <code>difference_type</code>                    | <code>return n</code>                                                                                                           | <pre>pre: there exists a value n of type difference_type such that a + n == b. b == a + (b - a).</pre> |
| <code>a[n]</code>                        | convertible to <code>reference</code>           | <code>*(a + n)</code>                                                                                                           |                                                                                                        |

}

```

## 24.4 Iterator primitives

[iterator.primitives]

- <sup>1</sup> To simplify the task of defining iterators, the library provides several classes and functions:

### 24.4.1 Iterator traits

[iterator.traits]

- <sup>1</sup> To implement algorithms only in terms of iterators, it is often necessary to determine the value and difference types that correspond to a particular iterator type. Accordingly, it is required that if `Iterator` is the type of an iterator, the types

```
iterator_traits<Iterator>::difference_type
iterator_traits<Iterator>::value_type
iterator_traits<Iterator>::iterator_category
```

be defined as the iterator's difference type, value type and iterator category, respectively. In addition, the types

```
iterator_traits<Iterator>::reference
iterator_traits<Iterator>::pointer
```

shall be defined as the iterator's reference and pointer types, that is, for an iterator object `a`, the same type as the type of `*a` and `a->`, respectively. In the case of an output iterator, the types

```
iterator_traits<Iterator>::difference_type
iterator_traits<Iterator>::value_type
iterator_traits<Iterator>::reference
iterator_traits<Iterator>::pointer
```

may be defined as `void`.

- <sup>2</sup> If `Iterator` has valid (14.8.2) member types `difference_type`, `value_type`, `pointer`, `reference`, and `iterator_category`, `iterator_traits<Iterator>` shall have the following as publicly accessible members and shall have no other members:

```
typedef typename Iterator::difference_type difference_type;
typedef typename Iterator::value_type value_type;
typedef typename Iterator::pointer pointer;
typedef typename Iterator::reference reference;
typedef typename Iterator::iterator_category iterator_category;
```

Otherwise, `iterator_traits<Iterator>` shall have no members.

- <sup>3</sup> It is specialized for pointers as

```
namespace std {
    template<class T> struct iterator_traits<T*> {
        typedef ptrdiff_t difference_type;
        typedef T value_type;
        typedef T* pointer;
        typedef T& reference;
        typedef random_access_iterator_tag iterator_category;
    };
}
```

and for pointers to `const` as

```
namespace std {
    template<class T> struct iterator_traits<const T*> {
        typedef ptrdiff_t difference_type;
        typedef T value_type;
        typedef const T* pointer;
        typedef const T& reference;
        typedef random_access_iterator_tag iterator_category;
    };
}
```

```
};
}
```

- <sup>4</sup> [*Example*: To implement a generic `reverse` function, a C++ program can do the following:

```
template <class BidirectionalIterator>
void reverse(BidirectionalIterator first, BidirectionalIterator last) {
    typename iterator_traits<BidirectionalIterator>::difference_type n =
        distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BidirectionalIterator>::value_type
            tmp = *first;
        *first++ = *--last;
        *last = tmp;
        n -= 2;
    }
}
```

— *end example*]

## 24.4.2 Basic iterator

[iterator.basic]

- <sup>1</sup> The iterator template may be used as a base class to ease the definition of required types for new iterators.

```
namespace std {
    template<class Category, class T, class Distance = ptrdiff_t,
            class Pointer = T*, class Reference = T&>
    struct iterator {
        typedef T          value_type;
        typedef Distance   difference_type;
        typedef Pointer     pointer;
        typedef Reference   reference;
        typedef Category    iterator_category;
    };
}
```

## 24.4.3 Standard iterator tags

[std.iterator.tags]

- <sup>1</sup> It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces *category tag* classes which are used as compile time tags for algorithm selection. They are: `input_iterator_tag`, `output_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag` and `random_access_iterator_tag`. For every iterator of type `Iterator`, `iterator_traits<Iterator>::iterator_category` shall be defined to be the most specific category tag that describes the iterator's behavior.

```
namespace std {
    struct input_iterator_tag { };
    struct output_iterator_tag { };
    struct forward_iterator_tag: public input_iterator_tag { };
    struct bidirectional_iterator_tag: public forward_iterator_tag { };
    struct random_access_iterator_tag: public bidirectional_iterator_tag { };
}
```

- <sup>2</sup> [*Example*: For a program-defined iterator `BinaryTreeIterator`, it could be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```
template<class T> struct iterator_traits<BinaryTreeIterator<T> > {
    typedef std::ptrdiff_t difference_type;
    typedef T value_type;
    typedef T* pointer;
    typedef T& reference;
    typedef bidirectional_iterator_tag iterator_category;
};
```

Typically, however, it would be easier to derive `BinaryTreeIterator<T>` from `iterator<bidirectional_iterator_tag,T,ptrdiff_t,T*,T*>`. — *end example*]

- <sup>3</sup> [ *Example*: If `evolve()` is well defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```
template <class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
    evolve(first, last,
        typename iterator_traits<BidirectionalIterator>::iterator_category());
}

template <class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
    bidirectional_iterator_tag) {
    // more generic, but less efficient algorithm
}

template <class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
    random_access_iterator_tag) {
    // more efficient, but less generic algorithm
}
```

— *end example*]

- <sup>4</sup> [ *Example*: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:

```
class MyIterator :
    public iterator<bidirectional_iterator_tag, double, long, T*, T*> {
    // code implementing ++, etc.
};
```

- <sup>5</sup> Then there is no need to specialize the `iterator_traits` template. — *end example*]

#### 24.4.4 Iterator operations

[iterator.operations]

- <sup>1</sup> Since only random access iterators provide `+` and `-` operators, the library provides two function templates `advance` and `distance`. These function templates use `+` and `-` for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use `++` to provide linear time implementations.

```
template <class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);
```

- <sup>2</sup> *Requires*: `n` shall be negative only for bidirectional and random access iterators.
- <sup>3</sup> *Effects*: Increments (or decrements for negative `n`) iterator reference `i` by `n`.

```
template <class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);
```

4 *Effects:* If `InputIterator` meets the requirements of random access iterator, returns `(last - first)`; otherwise, returns the number of increments needed to get from `first` to `last`.

5 *Requires:* If `InputIterator` meets the requirements of random access iterator, `last` shall be reachable from `first` or `first` shall be reachable from `last`; otherwise, `last` shall be reachable from `first`.

```
template <class InputIterator>
constexpr InputIterator next(InputIterator x,
    typename std::iterator_traits<InputIterator>::difference_type n = 1);
```

6 *Effects:* Equivalent to: `advance(x, n); return x;`

```
template <class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x,
    typename std::iterator_traits<BidirectionalIterator>::difference_type n = 1);
```

7 *Effects:* Equivalent to: `advance(x, -n); return x;`

## 24.5 Iterator adaptors

[predef.iterators]

### 24.5.1 Reverse iterators

[reverse.iterators]

1 Class template `reverse_iterator` is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity: `&*(reverse_iterator(i)) == &(i - 1)`.

#### 24.5.1.1 Class template `reverse_iterator`

[reverse.iterator]

```
namespace std {
    template <class Iterator>
    class reverse_iterator {
    public:
        typedef Iterator iterator_type;
        typedef typename iterator_traits<Iterator>::iterator_category iterator_category;
        typedef typename iterator_traits<Iterator>::value_type value_type;
        typedef typename iterator_traits<Iterator>::difference_type difference_type;
        typedef typename iterator_traits<Iterator>::pointer pointer;
        typedef typename iterator_traits<Iterator>::reference reference;

        constexpr reverse_iterator();
        constexpr explicit reverse_iterator(Iterator x);
        template <class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
        template <class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

        constexpr Iterator base() const; // explicit
        constexpr reference operator*() const;
        constexpr pointer operator->() const;

        constexpr reverse_iterator& operator++();
        constexpr reverse_iterator operator++(int);
        constexpr reverse_iterator& operator--();
        constexpr reverse_iterator operator--(int);

        constexpr reverse_iterator operator+ (difference_type n) const;
```

```

    constexpr reverse_iterator& operator+=(difference_type n);
    constexpr reverse_iterator operator- (difference_type n) const;
    constexpr reverse_iterator& operator-=(difference_type n);
    constexpr unspecified operator[] (difference_type n) const;
protected:
    Iterator current;
};

template <class Iterator1, class Iterator2>
constexpr bool operator==(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator<(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator>(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator>=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator<=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
template <class Iterator>
constexpr reverse_iterator<Iterator> operator+(
    typename reverse_iterator<Iterator>::difference_type n,
    const reverse_iterator<Iterator>& x);

template <class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
}

```

### 24.5.1.2 reverse\_iterator requirements

[reverse.iter.requirements]

- <sup>1</sup> The template parameter `Iterator` shall meet all the requirements of a Bidirectional Iterator (24.2.6).
- <sup>2</sup> Additionally, `Iterator` shall meet the requirements of a Random Access Iterator (24.2.7) if any of the members `operator+` (24.5.1.3.8), `operator-` (24.5.1.3.10), `operator+=` (24.5.1.3.9), `operator-=` (24.5.1.3.11), `operator []` (24.5.1.3.12), or the global operators `operator<` (24.5.1.3.14), `operator>` (24.5.1.3.16), `operator<=` (24.5.1.3.18), `operator>=` (24.5.1.3.17), `operator-` (24.5.1.3.19) or `operator+` (24.5.1.3.20) are referenced in a way that requires instantiation (14.7.1).

**24.5.1.3 reverse\_iterator operations** [reverse.iter.ops]**24.5.1.3.1 reverse\_iterator constructor** [reverse.iter.cons]

```
constexpr reverse_iterator();
```

- 1 *Effects:* Value-initializes `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `Iterator`.

```
constexpr explicit reverse_iterator(Iterator x);
```

- 2 *Effects:* Initializes `current` with `x`.

```
template <class U> constexpr reverse_iterator(const reverse_iterator<U> &u);
```

- 3 *Effects:* Initializes `current` with `u.current`.

**24.5.1.3.2 reverse\_iterator::operator=** [reverse.iter.op=]

```
template <class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);
```

- 1 *Effects:* Assigns `u.base()` to `current`.

- 2 *Returns:* `*this`.

**24.5.1.3.3 Conversion** [reverse.iter.conv]

```
constexpr Iterator base() const; // explicit
```

- 1 *Returns:* `current`.

**24.5.1.3.4 operator\*** [reverse.iter.op.star]

```
constexpr reference operator*() const;
```

- 1 *Effects:* As if by:

```
Iterator tmp = current;
return *--tmp;
```

**24.5.1.3.5 operator->** [reverse.iter.opref]

```
constexpr pointer operator->() const;
```

- 1 *Returns:* `std::addressof(operator*())`.

**24.5.1.3.6 operator++** [reverse.iter.op++]

```
constexpr reverse_iterator& operator++();
```

- 1 *Effects:* As if by: `--current`;

- 2 *Returns:* `*this`.

```
constexpr reverse_iterator operator++(int);
```

- 3 *Effects:* As if by:

```
reverse_iterator tmp = *this;
--current;
return tmp;
```

**24.5.1.3.7 operator--****[reverse.iter.op--]**

```
constexpr reverse_iterator& operator--();
```

1     *Effects:* As if by ++current.

2     *Returns:* \*this.

```
constexpr reverse_iterator operator--(int);
```

3     *Effects:* As if by:

```
reverse_iterator tmp = *this;
++current;
return tmp;
```

**24.5.1.3.8 operator+****[reverse.iter.op+]**

```
constexpr reverse_iterator
operator+(typename reverse_iterator<Iterator>::difference_type n) const;
```

1     *Returns:* reverse\_iterator(current-n).

**24.5.1.3.9 operator+=****[reverse.iter.op+=]**

```
constexpr reverse_iterator&
operator+=(typename reverse_iterator<Iterator>::difference_type n);
```

1     *Effects:* As if by: current -= n;

2     *Returns:* \*this.

**24.5.1.3.10 operator-****[reverse.iter.op-]**

```
constexpr reverse_iterator
operator-(typename reverse_iterator<Iterator>::difference_type n) const;
```

1     *Returns:* reverse\_iterator(current+n).

**24.5.1.3.11 operator-=****[reverse.iter.op-=]**

```
constexpr reverse_iterator&
operator-=(typename reverse_iterator<Iterator>::difference_type n);
```

1     *Effects:* As if by: current += n;

2     *Returns:* \*this.

**24.5.1.3.12 operator[]****[reverse.iter.opindex]**

```
constexpr unspecified operator[](
    typename reverse_iterator<Iterator>::difference_type n) const;
```

1     *Returns:* current[-n-1].

**24.5.1.3.13 operator==****[reverse.iter.op==]**

```
template <class Iterator1, class Iterator2>
constexpr bool operator==(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

1     *Returns:* x.current == y.current.

#### 24.5.1.3.14 operator< [reverse.iter.op<]

```
template <class Iterator1, class Iterator2>
constexpr bool operator<(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

<sup>1</sup> *Returns:* x.current > y.current.

#### 24.5.1.3.15 operator!= [reverse.iter.op!=]

```
template <class Iterator1, class Iterator2>
constexpr bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

<sup>1</sup> *Returns:* x.current != y.current.

#### 24.5.1.3.16 operator> [reverse.iter.op>]

```
template <class Iterator1, class Iterator2>
constexpr bool operator>(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

<sup>1</sup> *Returns:* x.current < y.current.

#### 24.5.1.3.17 operator>= [reverse.iter.op>=]

```
template <class Iterator1, class Iterator2>
constexpr bool operator>=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

<sup>1</sup> *Returns:* x.current <= y.current.

#### 24.5.1.3.18 operator<= [reverse.iter.op<=]

```
template <class Iterator1, class Iterator2>
constexpr bool operator<=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

<sup>1</sup> *Returns:* x.current >= y.current.

#### 24.5.1.3.19 operator- [reverse.iter.opdiff]

```
template <class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
```

<sup>1</sup> *Returns:* y.current - x.current.

#### 24.5.1.3.20 operator+ [reverse.iter.opsum]

```
template <class Iterator>
constexpr reverse_iterator<Iterator> operator+(
    typename reverse_iterator<Iterator>::difference_type n,
    const reverse_iterator<Iterator>& x);
```

<sup>1</sup> *Returns:* reverse\_iterator<Iterator> (x.current + n).

### 24.5.1.3.21 Non-member function `make_reverse_iterator()` [reverse.iter.make]

```
template <class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
```

<sup>1</sup> *Returns:* `reverse_iterator<Iterator>(i)`.

### 24.5.2 Insert iterators [insert.iterators]

<sup>1</sup> To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called *insert iterators*, are provided in the library. With regular iterator classes,

```
while (first != last) *result++ = *first++;
```

causes a range `[first, last)` to be copied into a range starting with `result`. The same code with `result` being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the *insert mode* instead of the *regular overwrite mode*.

<sup>2</sup> An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators satisfy the requirements of output iterators. `operator*` returns the insert iterator itself. The assignment `operator=(const T& x)` is defined on insert iterators to allow writing into them, it inserts `x` right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. `back_insert_iterator` inserts elements at the end of a container, `front_insert_iterator` inserts elements at the beginning of a container, and `insert_iterator` inserts elements where the iterator points to in a container. `back_inserter`, `front_inserter`, and `inserter` are three functions making the insert iterators out of a container.

#### 24.5.2.1 Class template `back_insert_iterator` [back.insert.iterator]

```
namespace std {
    template <class Container>
    class back_insert_iterator {
    protected:
        Container* container;

    public:
        typedef output_iterator_tag iterator_category;
        typedef void value_type;
        typedef void difference_type;
        typedef void pointer;
        typedef void reference;
        typedef Container container_type;
        explicit back_insert_iterator(Container& x);
        back_insert_iterator& operator=(const typename Container::value_type& value);
        back_insert_iterator& operator=(typename Container::value_type&& value);

        back_insert_iterator& operator*();
        back_insert_iterator& operator++();
        back_insert_iterator operator++(int);
    };

    template <class Container>
        back_insert_iterator<Container> back_inserter(Container& x);
}
```

#### 24.5.2.2 `back_insert_iterator` operations [back.insert.iter.ops]

##### 24.5.2.2.1 `back_insert_iterator` constructor [back.insert.iter.cons]

```
explicit back_insert_iterator(Container& x);
```

1     *Effects:* Initializes container with `std::addressof(x)`.

**24.5.2.2.2   back\_insert\_iterator::operator=** [back.insert.iter.op=]

```
back_insert_iterator& operator=(const typename Container::value_type& value);
```

1     *Effects:* As if by: `container->push_back(value)`;

2     *Returns:* `*this`.

```
back_insert_iterator& operator=(typename Container::value_type&& value);
```

3     *Effects:* As if by: `container->push_back(std::move(value))`;

4     *Returns:* `*this`.

**24.5.2.2.3   back\_insert\_iterator::operator\*** [back.insert.iter.op\*]

```
back_insert_iterator& operator*();
```

1     *Returns:* `*this`.

**24.5.2.2.4   back\_insert\_iterator::operator++** [back.insert.iter.op++]

```
back_insert_iterator& operator++();
```

```
back_insert_iterator operator++(int);
```

1     *Returns:* `*this`.

**24.5.2.2.5   back\_inserter** [back.inserter]

```
template <class Container>
```

```
    back_insert_iterator<Container> back_inserter(Container& x);
```

1     *Returns:* `back_insert_iterator<Container>(x)`.

**24.5.2.3   Class template front\_insert\_iterator** [front.insert.iterator]

```
namespace std {
```

```
    template <class Container>
```

```
    class front_insert_iterator {
```

```
    protected:
```

```
        Container* container;
```

```
    public:
```

```
        typedef output_iterator_tag iterator_category;
```

```
        typedef void value_type;
```

```
        typedef void difference_type;
```

```
        typedef void pointer;
```

```
        typedef void reference;
```

```
        typedef Container container_type;
```

```
        explicit front_insert_iterator(Container& x);
```

```
        front_insert_iterator& operator=(const typename Container::value_type& value);
```

```
        front_insert_iterator& operator=(typename Container::value_type&& value);
```

```
        front_insert_iterator& operator*();
```

```
        front_insert_iterator& operator++();
```

```
        front_insert_iterator operator++(int);
```

```
    };
```

```

    template <class Container>
        front_insert_iterator<Container> front_inserter(Container& x);
}

```

#### 24.5.2.4 front\_insert\_iterator operations [front.insert.iter.ops]

##### 24.5.2.4.1 front\_insert\_iterator constructor [front.insert.iter.cons]

```
explicit front_insert_iterator(Container& x);
```

<sup>1</sup> *Effects:* Initializes container with `std::addressof(x)`.

##### 24.5.2.4.2 front\_insert\_iterator::operator= [front.insert.iter.op=]

```
front_insert_iterator& operator=(const typename Container::value_type& value);
```

<sup>1</sup> *Effects:* As if by: `container->push_front(value)`;

<sup>2</sup> *Returns:* `*this`.

```
front_insert_iterator& operator=(typename Container::value_type&& value);
```

<sup>3</sup> *Effects:* As if by: `container->push_front(std::move(value))`;

<sup>4</sup> *Returns:* `*this`.

##### 24.5.2.4.3 front\_insert\_iterator::operator\* [front.insert.iter.op\*]

```
front_insert_iterator& operator*();
```

<sup>1</sup> *Returns:* `*this`.

##### 24.5.2.4.4 front\_insert\_iterator::operator++ [front.insert.iter.op++]

```
front_insert_iterator& operator++();
```

```
front_insert_iterator operator++(int);
```

<sup>1</sup> *Returns:* `*this`.

##### 24.5.2.4.5 front\_inserter [front.inserter]

```

template <class Container>
    front_insert_iterator<Container> front_inserter(Container& x);

```

<sup>1</sup> *Returns:* `front_insert_iterator<Container>(x)`.

#### 24.5.2.5 Class template insert\_iterator [insert.iterator]

```

namespace std {
    template <class Container>
        class insert_iterator {
        protected:
            Container* container;
            typename Container::iterator iter;

        public:
            typedef output_iterator_tag iterator_category;
            typedef void value_type;
            typedef void difference_type;
            typedef void pointer;
            typedef void reference;
            typedef Container container_type;
            insert_iterator(Container& x, typename Container::iterator i);

```

```

    insert_iterator& operator=(const typename Container::value_type& value);
    insert_iterator& operator=(typename Container::value_type&& value);

    insert_iterator& operator*();
    insert_iterator& operator++();
    insert_iterator& operator++(int);
};

template <class Container>
    insert_iterator<Container> inserter(Container& x, typename Container::iterator i);
}

```

#### 24.5.2.6 insert\_iterator operations [insert.iter.ops]

##### 24.5.2.6.1 insert\_iterator constructor [insert.iter.cons]

```
insert_iterator(Container& x, typename Container::iterator i);
```

<sup>1</sup> *Effects:* Initializes container with `std::addressof(x)` and `iter` with `i`.

##### 24.5.2.6.2 insert\_iterator::operator= [insert.iter.op=]

```
insert_iterator& operator=(const typename Container::value_type& value);
```

<sup>1</sup> *Effects:* As if by:

```

    iter = container->insert(iter, value);
    ++iter;

```

<sup>2</sup> *Returns:* `*this`.

```
insert_iterator& operator=(typename Container::value_type&& value);
```

<sup>3</sup> *Effects:* As if by:

```

    iter = container->insert(iter, std::move(value));
    ++iter;

```

<sup>4</sup> *Returns:* `*this`.

##### 24.5.2.6.3 insert\_iterator::operator\* [insert.iter.op\*]

```
insert_iterator& operator*();
```

<sup>1</sup> *Returns:* `*this`.

##### 24.5.2.6.4 insert\_iterator::operator++ [insert.iter.op++]

```

insert_iterator& operator++();
insert_iterator& operator++(int);

```

<sup>1</sup> *Returns:* `*this`.

##### 24.5.2.6.5 inserter [inserter]

```

template <class Container>
    insert_iterator<Container> inserter(Container& x, typename Container::iterator i);

```

<sup>1</sup> *Returns:* `insert_iterator<Container>(x, i)`.

### 24.5.3 Move iterators

[move.iterators]

- <sup>1</sup> Class template `move_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

- <sup>2</sup> [Example:

```
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end());           // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
                  make_move_iterator(s.end())); // moves strings into v2
```

— end example]

#### 24.5.3.1 Class template `move_iterator`

[move.iterator]

```
namespace std {
    template <class Iterator>
    class move_iterator {
    public:
        typedef Iterator          iterator_type;
        typedef typename iterator_traits<Iterator>::difference_type difference_type;
        typedef Iterator          pointer;
        typedef typename iterator_traits<Iterator>::value_type value_type;
        typedef typename iterator_traits<Iterator>::iterator_category iterator_category;
        typedef see below reference;

        constexpr move_iterator();
        constexpr explicit move_iterator(Iterator i);
        template <class U> constexpr move_iterator(const move_iterator<U>& u);
        template <class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

        constexpr iterator_type base() const;
        constexpr reference operator*() const;
        constexpr pointer operator->() const;

        constexpr move_iterator& operator++();
        constexpr move_iterator operator++(int);
        constexpr move_iterator& operator--();
        constexpr move_iterator operator--(int);

        constexpr move_iterator operator+(difference_type n) const;
        constexpr move_iterator& operator+=(difference_type n);
        constexpr move_iterator operator-(difference_type n) const;
        constexpr move_iterator& operator-=(difference_type n);
        constexpr unspecified operator[](difference_type n) const;

    private:
        Iterator current;    // exposition only
    };

    template <class Iterator1, class Iterator2>
    constexpr bool operator==(
        const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

```

template <class Iterator1, class Iterator2>
constexpr bool operator!=(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator<(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator<=(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator>(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
template <class Iterator1, class Iterator2>
constexpr bool operator>=(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

template <class Iterator1, class Iterator2>
constexpr auto operator-(
    const move_iterator<Iterator1>& x,
    const move_iterator<Iterator2>& y) -> decltype(x.base() - y.base());
template <class Iterator>
constexpr move_iterator<Iterator> operator+(
    typename move_iterator<Iterator>::difference_type n, const move_iterator<Iterator>& x);
template <class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
}

```

- <sup>1</sup> Let  $R$  denote `iterator_traits<Iterator>::reference`. If `is_reference_v<R>` is true, the template specialization `move_iterator<Iterator>` shall define the nested type named `reference` as a synonym for `remove_reference_t<R>&&`, otherwise as a synonym for  $R$ .

### 24.5.3.2 `move_iterator` requirements

[move.iter.requirements]

- <sup>1</sup> The template parameter `Iterator` shall meet the requirements for an Input Iterator (24.2.3). Additionally, if any of the bidirectional or random access traversal functions are instantiated, the template parameter shall meet the requirements for a Bidirectional Iterator (24.2.6) or a Random Access Iterator (24.2.7), respectively.

### 24.5.3.3 `move_iterator` operations

[move.iter.ops]

#### 24.5.3.3.1 `move_iterator` constructors

[move.iter.op.const]

```
constexpr move_iterator();
```

- <sup>1</sup> *Effects:* Constructs a `move_iterator`, value initializing `current`. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type `Iterator`.

```
constexpr explicit move_iterator(Iterator i);
```

- <sup>2</sup> *Effects:* Constructs a `move_iterator`, initializing `current` with `i`.

```
template <class U> constexpr move_iterator(const move_iterator<U>& u);
```

- <sup>3</sup> *Effects:* Constructs a `move_iterator`, initializing `current` with `u.base()`.

- <sup>4</sup> *Requires:* `U` shall be convertible to `Iterator`.

#### 24.5.3.3.2 `move_iterator::operator=`

[move.iter.op=]

```
template <class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
```

1 *Effects:* Assigns `u.base()` to `current`.

2 *Requires:* `U` shall be convertible to `Iterator`.

#### 24.5.3.3.3 `move_iterator` conversion

[move.iter.op.conv]

`constexpr Iterator base() const;`

1 *Returns:* `current`.

#### 24.5.3.3.4 `move_iterator::operator*`

[move.iter.op.star]

`constexpr reference operator*() const;`

1 *Returns:* `static_cast<reference>(*current)`.

#### 24.5.3.3.5 `move_iterator::operator->`

[move.iter.op.ref]

`constexpr pointer operator->() const;`

1 *Returns:* `current`.

#### 24.5.3.3.6 `move_iterator::operator++`

[move.iter.op.incr]

`constexpr move_iterator& operator++();`

1 *Effects:* As if by `++current`.

2 *Returns:* `*this`.

`constexpr move_iterator operator++(int);`

3 *Effects:* As if by:

```
move_iterator tmp = *this;
++current;
return tmp;
```

#### 24.5.3.3.7 `move_iterator::operator--`

[move.iter.op.decr]

`constexpr move_iterator& operator--();`

1 *Effects:* As if by `--current`.

2 *Returns:* `*this`.

`constexpr move_iterator operator--(int);`

3 *Effects:* As if by:

```
move_iterator tmp = *this;
--current;
return tmp;
```

#### 24.5.3.3.8 `move_iterator::operator+`

[move.iter.op.+]

`constexpr move_iterator operator+(difference_type n) const;`

1 *Returns:* `move_iterator(current + n)`.

#### 24.5.3.3.9 `move_iterator::operator+=`

[move.iter.op.+=]

`constexpr move_iterator& operator+=(difference_type n);`

1 *Effects:* As if by: `current += n;`

2 *Returns:* `*this`.

**24.5.3.3.10** `move_iterator::operator-` [move.iter.op.-]

```
constexpr move_iterator operator-(difference_type n) const;
```

1 *Returns:* `move_iterator(current - n)`.

**24.5.3.3.11** `move_iterator::operator-=` [move.iter.op.-=]

```
constexpr move_iterator& operator-=(difference_type n);
```

1 *Effects:* As if by: `current -= n`;

2 *Returns:* `*this`.

**24.5.3.3.12** `move_iterator::operator[]` [move.iter.op.index]

```
constexpr unspecified operator[](difference_type n) const;
```

1 *Returns:* `std::move(current[n])`.

**24.5.3.3.13** `move_iterator` comparisons [move.iter.op.comp]

```
template <class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

1 *Returns:* `x.base() == y.base()`.

```
template <class Iterator1, class Iterator2>
constexpr bool operator!=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

2 *Returns:* `!(x == y)`.

```
template <class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

3 *Returns:* `x.base() < y.base()`.

```
template <class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

4 *Returns:* `!(y < x)`.

```
template <class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

5 *Returns:* `y < x`.

```
template <class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

6 *Returns:* `!(x < y)`.

**24.5.3.3.14** `move_iterator` non-member functions [move.iter.nonmember]

```
template <class Iterator1, class Iterator2>
constexpr auto operator-(
    const move_iterator<Iterator1>& x,
    const move_iterator<Iterator2>& y) -> decltype(x.base() - y.base());
```

1 *Returns:* `x.base() - y.base()`.

```
template <class Iterator>
constexpr move_iterator<Iterator> operator+(
    typename move_iterator<Iterator>::difference_type n, const move_iterator<Iterator>& x);
```

2 *Returns:*  $x + n$ .

```
template <class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
```

3 *Returns:* `move_iterator<Iterator>(i)`.

## 24.6 Stream iterators

[stream.iterators]

- 1 To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[*Example:*

```
partial_sum(istream_iterator<double, char>(cin),
            istream_iterator<double, char>(),
            ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating point numbers from `cin`, and prints the partial sums onto `cout`. — *end example*]

### 24.6.1 Class template `istream_iterator`

[istream.iterator]

- 1 The class template `istream_iterator` is an input iterator (24.2.3) that reads (using `operator>>`) successive elements from the input stream for which it was constructed. After it is constructed, and every time `++` is used, the iterator reads and stores a value of `T`. If the iterator fails to read and store a value of `T` (`fail()` on the stream returns `true`), the iterator becomes equal to the *end-of-stream* iterator value. The constructor with no arguments `istream_iterator()` always constructs an end-of-stream input iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-stream iterator is not defined. For any other iterator value a `const T&` is returned. The result of `operator->` on an end-of-stream iterator is not defined. For any other iterator value a `const T*` is returned. The behavior of a program that applies `operator++()` to an end-of-stream iterator is undefined. It is impossible to store things into `istream` iterators.
- 2 Two end-of-stream iterators are always equal. An end-of-stream iterator is not equal to a non-end-of-stream iterator. Two non-end-of-stream iterators are equal when they are constructed from the same stream.

```
namespace std {
    template <class T, class charT = char, class traits = char_traits<charT>,
              class Distance = ptrdiff_t>
        class istream_iterator {
        public:
            typedef input_iterator_tag iterator_category;
            typedef T value_type;
            typedef Distance difference_type;
            typedef const T* pointer;
            typedef const T& reference;
            typedef charT char_type;
            typedef traits traits_type;
            typedef basic_istream<charT, traits> istream_type;
            see below istream_iterator();
            istream_iterator(istream_type& s);
            istream_iterator(const istream_iterator& x) = default;
            ~istream_iterator() = default;

            const T& operator*() const;
            const T* operator->() const;
            istream_iterator& operator++();
```

```

    istream_iterator operator++(int);
private:
    basic_istream<charT,traits>* in_stream; // exposition only
    T value;                               // exposition only
};

template <class T, class charT, class traits, class Distance>
    bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
                    const istream_iterator<T,charT,traits,Distance>& y);
template <class T, class charT, class traits, class Distance>
    bool operator!=(const istream_iterator<T,charT,traits,Distance>& x,
                    const istream_iterator<T,charT,traits,Distance>& y);
}

```

#### 24.6.1.1 istream\_iterator constructors and destructor

[istream.iterator.cons]

see below istream\_iterator();

1     *Effects:* Constructs the end-of-stream iterator. If T is a literal type, then this constructor shall be a constexpr constructor.

2     *Postcondition:* in\_stream == 0.

```
istream_iterator(istream_type& s);
```

3     *Effects:* Initializes in\_stream with addressof(s). value may be initialized during construction or the first time it is referenced.

4     *Postcondition:* in\_stream == addressof(s).

```
istream_iterator(const istream_iterator& x) = default;
```

5     *Effects:* Constructs a copy of x. If T is a literal type, then this constructor shall be a trivial copy constructor.

6     *Postcondition:* in\_stream == x.in\_stream.

```
~istream_iterator() = default;
```

7     *Effects:* The iterator is destroyed. If T is a literal type, then this destructor shall be a trivial destructor.

#### 24.6.1.2 istream\_iterator operations

[istream.iterator.ops]

```
const T& operator*() const;
```

1     *Returns:* value.

```
const T* operator->() const;
```

2     *Returns:* addressof(operator\*()).

```
istream_iterator& operator++();
```

3     *Requires:* in\_stream != 0.

4     *Effects:* As if by: \*in\_stream >>value;

5     *Returns:* \*this.

```
istream_iterator operator++(int);
```

6 *Requires:* `in_stream != 0`.

7 *Effects:* As if by:

```
    istream_iterator tmp = *this;
    *in_stream >> value;
    return (tmp);
```

```
template <class T, class charT, class traits, class Distance>
    bool operator==(const istream_iterator<T,charT,traits,Distance> &x,
                    const istream_iterator<T,charT,traits,Distance> &y);
```

8 *Returns:* `x.in_stream == y.in_stream`.

```
template <class T, class charT, class traits, class Distance>
    bool operator!=(const istream_iterator<T,charT,traits,Distance> &x,
                    const istream_iterator<T,charT,traits,Distance> &y);
```

9 *Returns:* `!(x == y)`

## 24.6.2 Class template `ostream_iterator`

[`ostream.iterator`]

1 `ostream_iterator` writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a *delimiter string*, is written to the stream after every `T` is written. It is not possible to get a value out of the output iterator. Its only use is as an output iterator in situations like

```
while (first != last)
    *result++ = *first++;
```

2 `ostream_iterator` is defined as:

```
namespace std {
    template <class T, class charT = char, class traits = char_traits<charT> >
        class ostream_iterator {
        public:
            typedef output_iterator_tag iterator_category;
            typedef void value_type;
            typedef void difference_type;
            typedef void pointer;
            typedef void reference;
            typedef charT char_type;
            typedef traits traits_type;
            typedef basic_ostream<charT,traits> ostream_type;
            ostream_iterator(ostream_type& s);
            ostream_iterator(ostream_type& s, const charT* delimiter);
            ostream_iterator(const ostream_iterator& x);
            ~ostream_iterator();
            ostream_iterator& operator=(const T& value);

            ostream_iterator& operator*();
            ostream_iterator& operator++();
            ostream_iterator& operator++(int);
        private:
            basic_ostream<charT,traits>* out_stream; // exposition only
            const charT* delim; // exposition only
        };
}
```

**24.6.2.1 ostream\_iterator constructors and destructor****[ostream.iterator.cons.des]**

```
ostream_iterator(ostream_type& s);
```

1 *Effects:* Initializes *out\_stream* with `addressof(s)` and *delim* with null.

```
ostream_iterator(ostream_type& s, const charT* delimiter);
```

2 *Effects:* Initializes *out\_stream* with `addressof(s)` and *delim* with *delimiter*.

```
ostream_iterator(const ostream_iterator& x);
```

3 *Effects:* Constructs a copy of *x*.

```
~ostream_iterator();
```

4 *Effects:* The iterator is destroyed.

**24.6.2.2 ostream\_iterator operations****[ostream.iterator.ops]**

```
ostream_iterator& operator=(const T& value);
```

1 *Effects:* As if by:

```
*out_stream << value;
if (delim != 0)
    *out_stream << delim;
return *this;
```

```
ostream_iterator& operator*();
```

2 *Returns:* *\*this*.

```
ostream_iterator& operator++();
ostream_iterator& operator++(int);
```

3 *Returns:* *\*this*.

**24.6.3 Class template istreambuf\_iterator****[istreambuf.iterator]**

1 The class template `istreambuf_iterator` defines an input iterator (24.2.3) that reads successive *characters* from the streambuf for which it was constructed. `operator*` provides access to the current input character, if any. [Note: `operator->` may return a proxy. — end note] Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the *end-of-stream* iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(0)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

2 The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```
namespace std {
    template<class charT, class traits = char_traits<charT> >
    class istreambuf_iterator {
    public:
        typedef input_iterator_tag          iterator_category;
        typedef charT                       value_type;
        typedef typename traits::off_type    difference_type;
        typedef unspecified                 pointer;
```

```

typedef charT                                reference;
typedef charT                                char_type;
typedef traits                                traits_type;
typedef typename traits::int_type             int_type;
typedef basic_streambuf<charT,traits>         streambuf_type;
typedef basic_istream<charT,traits>          istream_type;

class proxy;                                // exposition only

constexpr istreambuf_iterator() noexcept;
istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
~istreambuf_iterator() = default;
istreambuf_iterator(istream_type& s) noexcept;
istreambuf_iterator(streambuf_type* s) noexcept;
istreambuf_iterator(const proxy& p) noexcept;
charT operator*() const;
pointer operator->() const;
istreambuf_iterator& operator++();
proxy operator++(int);
bool equal(const istreambuf_iterator& b) const;
private:
    streambuf_type* sbuf_;                  // exposition only
};

template <class charT, class traits>
    bool operator==(const istreambuf_iterator<charT,traits>& a,
                    const istreambuf_iterator<charT,traits>& b);
template <class charT, class traits>
    bool operator!=(const istreambuf_iterator<charT,traits>& a,
                    const istreambuf_iterator<charT,traits>& b);
}

```

#### 24.6.3.1 Class template `istreambuf_iterator::proxy`

[istreambuf.iterator::proxy]

```

namespace std {
    template <class charT, class traits = char_traits<charT> >
    class istreambuf_iterator<charT, traits>::proxy { // exposition only
        charT keep_;
        basic_streambuf<charT,traits>* sbuf_;
        proxy(charT c, basic_streambuf<charT,traits>* sbuf)
            : keep_(c), sbuf_(sbuf) { }
    public:
        charT operator*() { return keep_; }
    };
}

```

- <sup>1</sup> Class `istreambuf_iterator<charT,traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT, traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

#### 24.6.3.2 `istreambuf_iterator` constructors

[istreambuf.iterator.cons]

```
constexpr istreambuf_iterator() noexcept;
```

- <sup>1</sup> *Effects:* Constructs the end-of-stream iterator.

```
istreambuf_iterator(basic_istream<charT,traits>& s) noexcept;
istreambuf_iterator(basic_streambuf<charT,traits>* s) noexcept;
```

- 2 *Effects:* Constructs an `istreambuf_iterator<>` that uses the `basic_streambuf<>` object `*(s.rdbuf())`, or `*s`, respectively. Constructs an end-of-stream iterator if `s.rdbuf()` is null.

```
istreambuf_iterator(const proxy& p) noexcept;
```

- 3 *Effects:* Constructs a `istreambuf_iterator<>` that uses the `basic_streambuf<>` object pointed to by the proxy object's constructor argument `p`.

### 24.6.3.3 `istreambuf_iterator::operator*` [istreambuf.iterator::op\*]

```
charT operator*() const
```

- 1 *Returns:* The character obtained via the `streambuf` member `sbuf_->sgetc()`.

### 24.6.3.4 `istreambuf_iterator::operator++` [istreambuf.iterator::op++]

```
istreambuf_iterator& operator++();
```

- 1 *Effects:* As if by `sbuf_->sbumpc()`.

- 2 *Returns:* `*this`.

```
proxy operator++(int);
```

- 3 *Returns:* `proxy(sbuf_->sbumpc(), sbuf_)`.

### 24.6.3.5 `istreambuf_iterator::equal` [istreambuf.iterator::equal]

```
bool equal(const istreambuf_iterator& b) const;
```

- 1 *Returns:* true if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

### 24.6.3.6 `operator==` [istreambuf.iterator::op==]

```
template <class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a,
                const istreambuf_iterator<charT,traits>& b);
```

- 1 *Returns:* `a.equal(b)`.

### 24.6.3.7 `operator!=` [istreambuf.iterator::op!=]

```
template <class charT, class traits>
bool operator!=(const istreambuf_iterator<charT,traits>& a,
                const istreambuf_iterator<charT,traits>& b);
```

- 1 *Returns:* `!a.equal(b)`.

## 24.6.4 Class template `ostreambuf_iterator` [ostreambuf.iterator]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class ostreambuf_iterator {
    public:
        typedef output_iterator_tag          iterator_category;
        typedef void                          value_type;
        typedef void                          difference_type;
        typedef void                          pointer;
```

```

typedef void                reference;
typedef charT               char_type;
typedef traits               traits_type;
typedef basic_streambuf<charT,traits> streambuf_type;
typedef basic_ostream<charT,traits> ostream_type;

ostreambuf_iterator(ostream_type& s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);

ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:
    streambuf_type* sbuf_;           // exposition only
};
}

```

- 1 The class template `ostreambuf_iterator` writes successive *characters* onto the output stream from which it was constructed. It is not possible to get a character value out of the output iterator.

#### 24.6.4.1 `ostreambuf_iterator` constructors [ostreambuf.iter.cons]

```
ostreambuf_iterator(ostream_type& s) noexcept;
```

- 1 *Requires:* `s.rdbuf()` shall not be a null pointer.  
 2 *Effects:* Initializes `sbuf_` with `s.rdbuf()`.

```
ostreambuf_iterator(streambuf_type* s) noexcept;
```

- 3 *Requires:* `s` shall not be a null pointer.  
 4 *Effects:* Initializes `sbuf_` with `s`.

#### 24.6.4.2 `ostreambuf_iterator` operations [ostreambuf.iter.ops]

```
ostreambuf_iterator& operator=(charT c);
```

- 1 *Effects:* If `failed()` yields false, calls `sbuf_->sputc(c)`; otherwise has no effect.  
 2 *Returns:* `*this`.

```
ostreambuf_iterator& operator*();
```

- 3 *Returns:* `*this`.

```
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
```

- 4 *Returns:* `*this`.

```
bool failed() const noexcept;
```

- 5 *Returns:* true if in any prior use of member `operator=`, the call to `sbuf_->sputc()` returned `traits::eof()`; or false otherwise.

## 24.7 Range access [iterator.range]

- <sup>1</sup> In addition to being available via inclusion of the `<iterator>` header, the function templates in 24.7 are available when any of the following headers are included: `<array>`, `<deque>`, `<forward_list>`, `<list>`, `<map>`, `<regex>`, `<set>`, `<string>`, `<unordered_map>`, `<unordered_set>`, and `<vector>`.

```
template <class C> constexpr auto begin(C& c) -> decltype(c.begin());
template <class C> constexpr auto begin(const C& c) -> decltype(c.begin());
```

- <sup>2</sup> *Returns:* `c.begin()`.

```
template <class C> constexpr auto end(C& c) -> decltype(c.end());
template <class C> constexpr auto end(const C& c) -> decltype(c.end());
```

- <sup>3</sup> *Returns:* `c.end()`.

```
template <class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
```

- <sup>4</sup> *Returns:* `array`.

```
template <class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
```

- <sup>5</sup> *Returns:* `array + N`.

```
template <class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
-> decltype(std::begin(c));
```

- <sup>6</sup> *Returns:* `std::begin(c)`.

```
template <class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
-> decltype(std::end(c));
```

- <sup>7</sup> *Returns:* `std::end(c)`.

```
template <class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template <class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());
```

- <sup>8</sup> *Returns:* `c.rbegin()`.

```
template <class C> constexpr auto rend(C& c) -> decltype(c.rend());
template <class C> constexpr auto rend(const C& c) -> decltype(c.rend());
```

- <sup>9</sup> *Returns:* `c.rend()`.

```
template <class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
```

- <sup>10</sup> *Returns:* `reverse_iterator<T*>(array + N)`.

```
template <class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);
```

- <sup>11</sup> *Returns:* `reverse_iterator<T*>(array)`.

```
template <class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);
```

- <sup>12</sup> *Returns:* `reverse_iterator<const E*>(il.end())`.

```
template <class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);
```

- <sup>13</sup> *Returns:* `reverse_iterator<const E*>(il.begin())`.

```
template <class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
```

- <sup>14</sup> *Returns:* `std::rbegin(c)`.

```
template <class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
```

- <sup>15</sup> *Returns:* `std::rend(c)`.

## 24.8 Container access [iterator.container]

- <sup>1</sup> In addition to being available via inclusion of the `<iterator>` header, the function templates in 24.8 are available when any of the following headers are included: `<array>`, `<deque>`, `<forward_list>`, `<list>`, `<map>`, `<regex>`, `<set>`, `<string>`, `<unordered_map>`, `<unordered_set>`, and `<vector>`.

```
template <class C> constexpr auto size(const C& c) -> decltype(c.size());
```

- <sup>2</sup> *Returns:* `c.size()`.

```
template <class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
```

- <sup>3</sup> *Returns:* `N`.

```
template <class C> constexpr auto empty(const C& c) -> decltype(c.empty());
```

- <sup>4</sup> *Returns:* `c.empty()`.

```
template <class T, size_t N> constexpr bool empty(const T (&array)[N]) noexcept;
```

- <sup>5</sup> *Returns:* `false`.

```
template <class E> constexpr bool empty(initializer_list<E> il) noexcept;
```

- <sup>6</sup> *Returns:* `il.size() == 0`.

```
template <class C> constexpr auto data(C& c) -> decltype(c.data());
```

```
template <class C> constexpr auto data(const C& c) -> decltype(c.data());
```

- <sup>7</sup> *Returns:* `c.data()`.

```
template <class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
```

- <sup>8</sup> *Returns:* `array`.

```
template <class E> constexpr const E* data(initializer_list<E> il) noexcept;
```

- <sup>9</sup> *Returns:* `il.begin()`.

## 25 Algorithms library

[algorithms]

### 25.1 General

[algorithms.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 23) and other sequences.
- <sup>2</sup> The following subclauses describe components for non-modifying sequence operation, modifying sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 119.

Table 119 — Algorithms library summary

| Subclause                                              | Header(s)   |
|--------------------------------------------------------|-------------|
| <a href="#">25.3</a> Non-modifying sequence operations |             |
| <a href="#">25.4</a> Mutating sequence operations      | <algorithm> |
| <a href="#">25.5</a> Sorting and related operations    |             |
| <a href="#">25.6</a> C library algorithms              | <cstdlib>   |

#### Header <algorithm> synopsis

```
#include <initializer_list>

namespace std {

    // 25.3, non-modifying sequence operations:
    template <class InputIterator, class Predicate>
        bool all_of(InputIterator first, InputIterator last, Predicate pred);
    template <class ExecutionPolicy, class InputIterator, class Predicate>
        bool all_of(ExecutionPolicy&& exec, // see 25.2.5
                    InputIterator first, InputIterator last, Predicate pred);
    template <class InputIterator, class Predicate>
        bool any_of(InputIterator first, InputIterator last, Predicate pred);
    template <class ExecutionPolicy, class InputIterator, class Predicate>
        bool any_of(ExecutionPolicy&& exec, // see 25.2.5
                    InputIterator first, InputIterator last, Predicate pred);
    template <class InputIterator, class Predicate>
        bool none_of(InputIterator first, InputIterator last, Predicate pred);
    template <class ExecutionPolicy, class InputIterator, class Predicate>
        bool none_of(ExecutionPolicy&& exec, // see 25.2.5
                    InputIterator first, InputIterator last, Predicate pred);

    template<class InputIterator, class Function>
        Function for_each(InputIterator first, InputIterator last, Function f);
    template<class ExecutionPolicy, class InputIterator, class Function>
        void for_each(ExecutionPolicy&& exec,
                     InputIterator first, InputIterator last, Function f);
    template<class InputIterator, class Size, class Function>
        InputIterator for_each_n(InputIterator first, Size n, Function f);
    template<class ExecutionPolicy, class InputIterator, class Size, class Function>

}

```

- 3 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.
  - 4 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.
  - 5 Throughout this Clause, the names of template parameters are used to express type requirements.
- (5.1) — If an algorithm's template parameter is named `InputIterator`, `InputIterator1`, or `InputIterator2`, the template argument shall satisfy the requirements of an input iterator (24.2.3).
  - (5.2) — If an algorithm's template parameter is named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, the template argument shall satisfy the requirements of an output iterator (24.2.4).
  - (5.3) — If an algorithm's template parameter is named `ForwardIterator`, `ForwardIterator1`, or `ForwardIterator2`, the template argument shall satisfy the requirements of a forward iterator (24.2.5).
  - (5.4) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall satisfy the requirements of a bidirectional iterator (24.2.6).
  - (5.5) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall satisfy the requirements of a random-access iterator (24.2.7).

- <sup>6</sup> If an algorithm's **Effects** section says that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall satisfy the requirements of a mutable iterator (24.2). [ *Note*: This requirement does not affect arguments that are named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, because output iterators must always be mutable. — *end note* ]
- <sup>7</sup> Both in-place and copying versions are provided for certain algorithms.<sup>268</sup> When such a version is provided for *algorithm* it is called *algorithm\_copy*. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).
- <sup>8</sup> The **Predicate** parameter is used whenever an algorithm expects a function object (20.12) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. In other words, if an algorithm takes **Predicate** `pred` as its argument and `first` as its iterator argument, it should work correctly in the construct `pred(*first)` contextually converted to `bool` (Clause 4). The function object `pred` shall not apply any non-constant function through the dereferenced iterator.
- <sup>9</sup> The **BinaryPredicate** parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature returns a value testable as `true`. In other words, if an algorithm takes **BinaryPredicate** `binary_pred` as its argument and `first1` and `first2` as its iterator arguments, it should work correctly in the construct `binary_pred(*first1, *first2)` contextually converted to `bool` (Clause 4). **BinaryPredicate** always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T value` is part of the signature, it should work correctly in the construct `binary_pred(*first1, value)` contextually converted to `bool` (Clause 4). `binary_pred` shall not apply any non-constant function through the dereferenced iterators.
- <sup>10</sup> [ *Note*: Unless otherwise specified, algorithms that take function objects as arguments are permitted to copy those function objects freely. Programmers for whom object identity is important should consider using a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (20.12.4), or some equivalent solution. — *end note* ]
- <sup>11</sup> When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.
- <sup>12</sup> In the description of the algorithms operators `+` and `-` are used for some of the iterator categories for which they do not have to be defined. In these cases the semantics of `a+n` is the same as that of

```
X tmp = a;
advance(tmp, n);
return tmp;
```

and that of `b-a` is the same as of

```
return distance(a, b);
```

## 25.2 Parallel algorithms

[algorithms.parallel]

This section describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

### 25.2.1 Terms and definitions

[algorithms.parallel.defns]

- <sup>1</sup> A *parallel algorithm* is a function template listed in this standard with a template parameter named `ExecutionPolicy`.

<sup>268</sup>) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users might as well do `copy` followed by `sort`.

2 Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

- (2.1) — All operations of the categories of the iterators that the algorithm is instantiated with.
- (2.2) — Operations on those sequence elements that are required by its specification.
- (2.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
- (2.4) — Operations on those function objects required by the specification. [ *Note:* See 25.1. — *end note* ]

These functions are herein called *element access functions*. [ *Example:* The `sort` function may invoke the following element access functions:

- (2.5) — Operations of the random-access iterator of the actual template argument (as per 24.2.7), as implied by the name of the template parameter `RandomAccessIterator`.
- (2.6) — The `swap` function on the elements of the sequence (as per the preconditions specified in 25.5.1.1).
- (2.7) — The user-provided `Compare` function object.

— *end example* ]

### 25.2.2 Requirements on user-provided function objects [algorithms.parallel.user]

- 1 Function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, and `BinaryOperation` shall not directly or indirectly modify objects via their arguments.

### 25.2.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

- 1 Parallel algorithms have template parameters named `ExecutionPolicy` which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.
- 2 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `sequential_execution_policy` are indeterminately sequenced (1.9) in the calling thread.
- 3 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `parallel_execution_policy` are permitted to execute in either the invoking thread or in a thread implicitly created by the library to support parallel algorithm execution. Any such invocations executing in the same thread are indeterminately sequenced with respect to each other. [ *Note:* It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks. — *end note* ] [ *Example:*

```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::par, std::begin(a), std::end(a), [&](int i) {
    v.push_back(i*2+1); // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — *end example* ] [ *Example:*

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::par, std::begin(a), std::end(a), [&](int) {
    x.fetch_add(1, std::memory_order_relaxed);
    // spin wait for another iteration to change the value of x
    while (x.load(std::memory_order_relaxed) == 1) { } // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread. — *end example*] [Example:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::par, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);
    ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — *end example*]

- <sup>4</sup> The invocations of element access functions in parallel algorithms invoked with an execution policy of type `parallel_vector_execution_policy` are permitted to execute in an unordered fashion in unspecified threads, and unsequenced with respect to one another within each thread. [Note: This means that multiple function object invocations may be interleaved on a single thread, which overrides the usual guarantee from 1.9 that function executions do not interleave with one another. — *end note*] Since `parallel_vector_execution_policy` allows the execution of element access functions to be interleaved on a single thread, synchronization, including the use of mutexes, risks deadlock. Thus the synchronization with `parallel_vector_execution_policy` is restricted as follows: A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function. Vectorization-unsafe standard library functions may not be invoked by user code called from `parallel_vector_execution_policy` algorithms. [Note: Implementations must ensure that internal synchronization inside standard library routines does not induce deadlock. — *end note*] [Example:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::par_vec, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m); // incorrect: lock_guard constructor calls m.lock()
    ++x;
});
```

The above program may result in two consecutive calls to `m.lock()` on the same thread (which may deadlock), because the applications of the function object are not guaranteed to run on different threads. — *end example*] [Note: The semantics of the `parallel_execution_policy` or the `parallel_vector_execution_policy` invocation allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation due to lack of resources. — *end note*]

- <sup>5</sup> The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

## 25.2.4 Parallel algorithm exceptions

[algorithms.parallel.exceptions]

- <sup>1</sup> During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.
- <sup>2</sup> During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior of the program is determined by the type of execution policy used to invoke the algorithm:
- (2.1) — If the execution policy object is of type `parallel_vector_execution_policy`, `terminate()` is called.
  - (2.2) — If the execution policy object is of type `sequential_execution_policy` or `parallel_execution_policy`, the execution of the algorithm exits via an exception. The exception will be an `exception_list` containing all uncaught exceptions thrown during the invocations of element access functions,

or optionally the uncaught exception if there was only one. [ *Note*: For example, when `for_each` is executed sequentially, if an invocation of the user-provided function object throws an exception, `for_each` can exit via the uncaught exception, or throw an `exception_list` containing the original exception. — *end note*] [ *Note*: These guarantees imply that, unless the algorithm has failed to allocate memory and exits via `bad_alloc`, all exceptions thrown during the execution of the algorithm are communicated to the caller. It is unspecified whether an algorithm implementation will “forge ahead” after encountering and capturing a user exception. — *end note*] [ *Note*: The algorithm may exit via the `bad_alloc` exception even if one or more user-provided function objects have exited via an exception. For example, this can happen when an algorithm fails to allocate memory while creating or adding elements to the `exception_list` object. — *end note*]

- (2.3) — If the execution policy object is of any other type, the behavior is implementation-defined.

### 25.2.5 ExecutionPolicy algorithm overloads [algorithms.parallel.overloads]

- <sup>1</sup> Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter. [ *Note*: Not all algorithms have parallel algorithm overloads. — *end note*]
- <sup>2</sup> Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.
- <sup>3</sup> Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<decay_t<ExecutionPolicy>>` is true.

## 25.3 Non-modifying sequence operations [alg.nonmodifying]

### 25.3.1 All of [alg.all\_of]

```
template <class InputIterator, class Predicate>
    bool all_of(InputIterator first, InputIterator last, Predicate pred);
```

- <sup>1</sup> *Returns*: true if `[first, last)` is empty or if `pred(*i)` is true for every iterator `i` in the range `[first, last)`, and false otherwise.
- <sup>2</sup> *Complexity*: At most `last - first` applications of the predicate.

### 25.3.2 Any of [alg.any\_of]

```
template <class InputIterator, class Predicate>
    bool any_of(InputIterator first, InputIterator last, Predicate pred);
```

- <sup>1</sup> *Returns*: false if `[first, last)` is empty or if there is no iterator `i` in the range `[first, last)` such that `pred(*i)` is true, and true otherwise.
- <sup>2</sup> *Complexity*: At most `last - first` applications of the predicate.

### 25.3.3 None of [alg.none\_of]

```
template <class InputIterator, class Predicate>
    bool none_of(InputIterator first, InputIterator last, Predicate pred);
```

- <sup>1</sup> *Returns*: true if `[first, last)` is empty or if `pred(*i)` is false for every iterator `i` in the range `[first, last)`, and false otherwise.
- <sup>2</sup> *Complexity*: At most `last - first` applications of the predicate.

**25.3.4 For each****[alg.foreach]**

```
template<class InputIterator, class Function>
```

```
    Function for_each(InputIterator first, InputIterator last, Function f);
```

1     *Requires:* Function shall meet the requirements of `MoveConstructible` (Table 20). [ *Note:* Function need not meet the requirements of `CopyConstructible` (Table 21). — *end note* ]

2     *Effects:* Applies `f` to the result of dereferencing every iterator in the range `[first, last)`, starting from `first` and proceeding to `last - 1`. [ *Note:* If the type of `first` satisfies the requirements of a mutable iterator, `f` may apply nonconstant functions through the dereferenced iterator. — *end note* ]

3     *Returns:* `std::move(f)`.

4     *Complexity:* Applies `f` exactly `last - first` times.

5     *Remarks:* If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class InputIterator, class Function>
```

```
    void for_each(ExecutionPolicy&& exec,
                  InputIterator first, InputIterator last,
                  Function f);
```

6     *Requires:* Function shall meet the requirements of `CopyConstructible`.

7     *Effects:* Applies `f` to the result of dereferencing every iterator in the range `[first, last)`. [ *Note:* If the type of `first` satisfies the requirements of a mutable iterator, `f` may apply nonconstant functions through the dereferenced iterator. — *end note* ]

8     *Complexity:* Applies `f` exactly `last - first` times.

9     *Remarks:* If `f` returns a result, the result is ignored.

10    *Notes:* Does not return a copy of its `Function` parameter, since parallelization may not permit efficient state accumulation.

```
template<class InputIterator, class Size, class Function>
```

```
    InputIterator for_each_n(InputIterator first, Size n, Function f);
```

11    *Requires:* Function shall meet the requirements of `MoveConstructible` [ *Note:* Function need not meet the requirements of `CopyConstructible`. — *end note* ]

12    *Requires:* `n >= 0`.

13    *Effects:* Applies `f` to the result of dereferencing every iterator in the range `[first, first + n)` in order. [ *Note:* If the type of `first` satisfies the requirements of a mutable iterator, `f` may apply nonconstant functions through the dereferenced iterator. — *end note* ]

14    *Returns:* `first + n`.

15    *Remarks:* If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class InputIterator, class Size, class Function>
```

```
    InputIterator for_each_n(ExecutionPolicy&& exec, InputIterator first, Size n,
                             Function f);
```

16    *Requires:* Function shall meet the requirements of `CopyConstructible`.

17    *Requires:* `n >= 0`.

18    *Effects:* Applies `f` to the result of dereferencing every iterator in the range `[first, first + n)`. [ *Note:* If the type of `first` satisfies the requirements of a mutable iterator, `f` may apply nonconstant functions through the dereferenced iterator. — *end note* ]

19    *Returns:* `first + n`.

20    *Remarks:* If `f` returns a result, the result is ignored.

**25.3.5 Find****[alg.find]**

```

template<class InputIterator, class T>
    InputIterator find(InputIterator first, InputIterator last,
                      const T& value);

template<class InputIterator, class Predicate>
    InputIterator find_if(InputIterator first, InputIterator last,
                          Predicate pred);
template<class InputIterator, class Predicate>
    InputIterator find_if_not(InputIterator first, InputIterator last,
                              Predicate pred);

```

- 1 *Returns:* The first iterator *i* in the range  $[first, last)$  for which the following corresponding conditions hold:  $*i == value$ ,  $pred(*i) != false$ ,  $pred(*i) == false$ . Returns *last* if no such iterator is found.
- 2 *Complexity:* At most  $last - first$  applications of the corresponding predicate.

**25.3.6 Find end****[alg.find.end]**

```

template<class ForwardIterator1, class ForwardIterator2>
    ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
    ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,
             ForwardIterator2 first2, ForwardIterator2 last2,
             BinaryPredicate pred);

```

- 1 *Effects:* Finds a subsequence of equal values in a sequence.
- 2 *Returns:* The last iterator *i* in the range  $[first1, last1 - (last2 - first2))$  such that for every non-negative integer  $n < (last2 - first2)$ , the following corresponding conditions hold:  $*(i + n) == *(first2 + n)$ ,  $pred(*(i + n), *(first2 + n)) != false$ . Returns *last1* if  $[first2, last2)$  is empty or if no such iterator is found.
- 3 *Complexity:* At most  $(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)$  applications of the corresponding predicate.

**25.3.7 Find first****[alg.find.first.of]**

```

template<class InputIterator, class ForwardIterator>
    InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2);

template<class InputIterator, class ForwardIterator,
         class BinaryPredicate>
    InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2,
                  BinaryPredicate pred);

```

- 1 *Effects:* Finds an element that matches one of a set of values.

<sup>2</sup> *Returns:* The first iterator *i* in the range `[first1, last1)` such that for some iterator *j* in the range `[first2, last2)` the following conditions hold: `*i == *j`, `pred(*i,*j) != false`. Returns `last1` if `[first2, last2)` is empty or if no such iterator is found.

<sup>3</sup> *Complexity:* At most  $(last1 - first1) * (last2 - first2)$  applications of the corresponding predicate.

### 25.3.8 Adjacent find

[alg.adjacent.find]

```
template<class ForwardIterator>
    ForwardIterator adjacent_find(ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class BinaryPredicate>
    ForwardIterator adjacent_find(ForwardIterator first, ForwardIterator last,
                                BinaryPredicate pred);
```

<sup>1</sup> *Returns:* The first iterator *i* such that both *i* and *i + 1* are in the range `[first, last)` for which the following corresponding conditions hold: `*i == *(i + 1)`, `pred(*i, *(i + 1)) != false`. Returns `last` if no such iterator is found.

<sup>2</sup> *Complexity:* For a nonempty range, exactly  $\min((i - first) + 1, (last - first) - 1)$  applications of the corresponding predicate, where *i* is `adjacent_find`'s return value.

### 25.3.9 Count

[alg.count]

```
template<class InputIterator, class T>
    typename iterator_traits<InputIterator>::difference_type
    count(InputIterator first, InputIterator last, const T& value);
```

```
template<class InputIterator, class Predicate>
    typename iterator_traits<InputIterator>::difference_type
    count_if(InputIterator first, InputIterator last, Predicate pred);
```

<sup>1</sup> *Effects:* Returns the number of iterators *i* in the range `[first, last)` for which the following corresponding conditions hold: `*i == value`, `pred(*i) != false`.

<sup>2</sup> *Complexity:* Exactly `last - first` applications of the corresponding predicate.

### 25.3.10 Mismatch

[mismatch]

```
template<class InputIterator1, class InputIterator2>
    pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2);
```

```
template<class InputIterator1, class InputIterator2,
        class BinaryPredicate>
    pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, BinaryPredicate pred);
```

```
template<class InputIterator1, class InputIterator2>
    pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2, InputIterator2 last2);
```

```
template <class InputIterator1, class InputIterator2,
        class BinaryPredicate>
    pair<InputIterator1, InputIterator2>
```

```
mismatch(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2,
         BinaryPredicate pred);
```

1 *Remarks:* If `last2` was not given in the argument list, it denotes `first2 + (last1 - first1)` below.

2 *Returns:* A pair of iterators `i` and `j` such that `j == first2 + (i - first1)` and `i` is the first iterator in the range `[first1, last1)` for which the following corresponding conditions hold:

(2.1) — `j` is in the range `[first2, last2)`.

(2.2) — `!(*i == *(first2 + (i - first1)))`

(2.3) — `pred(*i, *(first2 + (i - first1))) == false`

Returns the pair `first1 + min(last1 - first1, last2 - first2)` and `first2 + min(last1 - first1, last2 - first2)` if such an iterator `i` is not found.

3 *Complexity:* At most `min(last1 - first1, last2 - first2)` applications of the corresponding predicate.

### 25.3.11 Equal

[alg.equal]

```
template<class InputIterator1, class InputIterator2>
bool equal(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2);
```

```
template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
bool equal(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, BinaryPredicate pred);
```

```
template<class InputIterator1, class InputIterator2>
bool equal(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2);
```

```
template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
bool equal(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          BinaryPredicate pred);
```

1 *Remarks:* If `last2` was not given in the argument list, it denotes `first2 + (last1 - first1)` below.

2 *Returns:* If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if for every iterator `i` in the range `[first1, last1)` the following corresponding conditions hold: `*i == *(first2 + (i - first1))`, `pred(*i, *(first2 + (i - first1))) != false`. Otherwise, returns `false`.

3 *Complexity:* No applications of the corresponding predicate if `InputIterator1` and `InputIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, at most `min(last1 - first1, last2 - first2)` applications of the corresponding predicate.

### 25.3.12 Is permutation

[alg.is\_permutation]

```
template<class ForwardIterator1, class ForwardIterator2>
bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, BinaryPredicate pred);
```

```

template<class ForwardIterator1, class ForwardIterator2>
    bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                       ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2,
        class BinaryPredicate>
    bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                       ForwardIterator2 first2, ForwardIterator2 last2,
                       BinaryPredicate pred);

```

- 1 *Requires:* ForwardIterator1 and ForwardIterator2 shall have the same value type. The comparison function shall be an equivalence relation.
- 2 *Remarks:* If last2 was not given in the argument list, it denotes first2 + (last1 - first1) below.
- 3 *Returns:* If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, first2 + (last1 - first1)), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin) returns true or equal(first1, last1, begin, pred) returns true; otherwise, returns false.
- 4 *Complexity:* No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2) would return true if pred was not given in the argument list or equal(first1, last1, first2, last2, pred) would return true if pred was given in the argument list; otherwise, at worst  $\mathcal{O}(N^2)$ , where  $N$  has the value last1 - first1.

### 25.3.13 Search

[alg.search]

```

template<class ForwardIterator1, class ForwardIterator2>
    ForwardIterator1
        search(ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
        class BinaryPredicate>
    ForwardIterator1
        search(ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              BinaryPredicate pred);

```

- 1 *Effects:* Finds a subsequence of equal values in a sequence.
- 2 *Returns:* The first iterator i in the range [first1, last1 - (last2 - first2)) such that for every non-negative integer n less than last2 - first2 the following corresponding conditions hold: \*(i + n) == \*(first2 + n), pred(\*(i + n), \*(first2 + n)) != false. Returns first1 if [first2, last2) is empty, otherwise returns last1 if no such iterator is found.
- 3 *Complexity:* At most (last1 - first1) \* (last2 - first2) applications of the corresponding predicate.

```

template<class ForwardIterator, class Size, class T>
    ForwardIterator
        search_n(ForwardIterator first, ForwardIterator last, Size count,
                const T& value);

template<class ForwardIterator, class Size, class T,
        class BinaryPredicate>
    ForwardIterator

```

```
search_n(ForwardIterator first, ForwardIterator last, Size count,
         const T& value, BinaryPredicate pred);
```

4     *Requires:* The type `Size` shall be convertible to integral type (4.7, 12.3).

5     *Effects:* Finds a subsequence of equal values in a sequence.

6     *Returns:* The first iterator `i` in the range `[first, last-count)` such that for every non-negative integer `n` less than `count` the following corresponding conditions hold: `*(i + n) == value`, `pred(*(i + n), value) != false`. Returns `last` if no such iterator is found.

7     *Complexity:* At most `last - first` applications of the corresponding predicate.

```
template<class ForwardIterator, class Searcher>
ForwardIterator search(ForwardIterator first, ForwardIterator last,
                     const Searcher& searcher);
```

8     *Effects:* Equivalent to: `return searcher(first, last).first;`

9     *Remarks:* `Searcher` need not meet the `CopyConstructible` requirements.

## 25.4 Mutating sequence operations

[alg.modifying.operations]

### 25.4.1 Copy

[alg.copy]

```
template<class InputIterator, class OutputIterator>
OutputIterator copy(InputIterator first, InputIterator last,
                   OutputIterator result);
```

1     *Effects:* Copies elements in the range `[first, last)` into the range `[result, result + (last - first))` starting from `first` and proceeding to `last`. For each non-negative integer `n < (last - first)`, performs `*(result + n) = *(first + n)`.

2     *Returns:* `result + (last - first)`.

3     *Requires:* `result` shall not be in the range `[first, last)`.

4     *Complexity:* Exactly `last - first` assignments.

```
template<class InputIterator, class Size, class OutputIterator>
OutputIterator copy_n(InputIterator first, Size n,
                     OutputIterator result);
```

5     *Effects:* For each non-negative integer  $i < n$ , performs `*(result + i) = *(first + i)`.

6     *Returns:* `result + n`.

7     *Complexity:* Exactly `n` assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
OutputIterator copy_if(InputIterator first, InputIterator last,
                     OutputIterator result, Predicate pred);
```

8     *Requires:* The ranges `[first, last)` and `[result, result + (last - first))` shall not overlap.

9     *Effects:* Copies all of the elements referred to by the iterator `i` in the range `[first, last)` for which `pred(*i)` is true.

10    *Returns:* The end of the resulting range.

11    *Complexity:* Exactly `last - first` applications of the corresponding predicate.

12    *Remarks:* Stable (17.6.5.7).

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
    BidirectionalIterator2
    copy_backward(BidirectionalIterator1 first,
                  BidirectionalIterator1 last,
                  BidirectionalIterator2 result);
```

- 13 *Effects:* Copies elements in the range `[first, last)` into the range `[result - (last-first), result)` starting from `last - 1` and proceeding to `first`.<sup>269</sup> For each positive integer `n <= (last - first)`, performs `*(result - n) = *(last - n)`.
- 14 *Requires:* `result` shall not be in the range `(first, last]`.
- 15 *Returns:* `result - (last - first)`.
- 16 *Complexity:* Exactly `last - first` assignments.

### 25.4.2 Move

[alg.move]

```
template<class InputIterator, class OutputIterator>
    OutputIterator move(InputIterator first, InputIterator last,
                       OutputIterator result);
```

- 1 *Effects:* Moves elements in the range `[first, last)` into the range `[result, result + (last - first))` starting from `first` and proceeding to `last`. For each non-negative integer `n < (last-first)`, performs `*(result + n) = std::move(*(first + n))`.
- 2 *Returns:* `result + (last - first)`.
- 3 *Requires:* `result` shall not be in the range `[first, last)`.
- 4 *Complexity:* Exactly `last - first` move assignments.

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
    BidirectionalIterator2
    move_backward(BidirectionalIterator1 first,
                  BidirectionalIterator1 last,
                  BidirectionalIterator2 result);
```

- 5 *Effects:* Moves elements in the range `[first, last)` into the range `[result - (last-first), result)` starting from `last - 1` and proceeding to `first`.<sup>270</sup> For each positive integer `n <= (last - first)`, performs `*(result - n) = std::move(*(last - n))`.
- 6 *Requires:* `result` shall not be in the range `(first, last]`.
- 7 *Returns:* `result - (last - first)`.
- 8 *Complexity:* Exactly `last - first` assignments.

### 25.4.3 swap

[alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
    ForwardIterator2
    swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);
```

- 1 *Effects:* For each non-negative integer `n < (last1 - first1)` performs: `swap(*(first1 + n), *(first2 + n))`.
- 2 *Requires:* The two ranges `[first1, last1)` and `[first2, first2 + (last1 - first1))` shall not overlap. `*(first1 + n)` shall be swappable with `(17.6.3.2) *(first2 + n)`.

<sup>269</sup> `copy_backward` should be used instead of `copy` when `last` is in the range `[result - (last - first), result)`.

<sup>270</sup> `move_backward` should be used instead of `move` when `last` is in the range `[result - (last - first), result)`.

3 *Returns:* `first2 + (last1 - first1)`.

4 *Complexity:* Exactly `last1 - first1` swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

5 *Effects:* As if by `swap(*a, *b)`.

6 *Requires:* `a` and `b` shall be dereferenceable. `*a` shall be swappable with (17.6.3.2) `*b`.

#### 25.4.4 Transform

[alg.transform]

```
template<class InputIterator, class OutputIterator,
        class UnaryOperation>
OutputIterator
transform(InputIterator first, InputIterator last,
          OutputIterator result, UnaryOperation op);
```

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator, class BinaryOperation>
OutputIterator
transform(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, OutputIterator result,
          BinaryOperation binary_op);
```

1 *Effects:* Assigns through every iterator `i` in the range `[result, result + (last1 - first1))` a new corresponding value equal to `op(*(first1 + (i - result))` or `binary_op(*(first1 + (i - result)), *(first2 + (i - result)))`.

2 *Requires:* `op` and `binary_op` shall not invalidate iterators or subranges, or modify elements in the ranges

(2.1) — `[first1, last1]`,

(2.2) — `[first2, first2 + (last1 - first1)]`, and

(2.3) — `[result, result + (last1 - first1)]`.<sup>271</sup>

3 *Returns:* `result + (last1 - first1)`.

4 *Complexity:* Exactly `last1 - first1` applications of `op` or `binary_op`.

5 *Remarks:* `result` may be equal to `first` in case of unary transform, or to `first1` or `first2` in case of binary transform.

#### 25.4.5 Replace

[alg.replace]

```
template<class ForwardIterator, class T>
void replace(ForwardIterator first, ForwardIterator last,
            const T& old_value, const T& new_value);
```

```
template<class ForwardIterator, class Predicate, class T>
void replace_if(ForwardIterator first, ForwardIterator last,
               Predicate pred, const T& new_value);
```

1 *Requires:* The expression `*first = new_value` shall be valid.

2 *Effects:* Substitutes elements referred by the iterator `i` in the range `[first, last)` with `new_value`, when the following corresponding conditions hold: `*i == old_value`, `pred(*i) != false`.

3 *Complexity:* Exactly `last - first` applications of the corresponding predicate.

<sup>271</sup>) The use of fully closed ranges is intentional.

```
template<class InputIterator, class OutputIterator, class T>
OutputIterator
replace_copy(InputIterator first, InputIterator last,
             OutputIterator result,
             const T& old_value, const T& new_value);
```

```
template<class InputIterator, class OutputIterator, class Predicate, class T>
OutputIterator
replace_copy_if(InputIterator first, InputIterator last,
                OutputIterator result,
                Predicate pred, const T& new_value);
```

4     *Requires:* The results of the expressions `*first` and `new_value` shall be writable (24.2.1) to the `result` output iterator. The ranges `[first, last)` and `[result, result + (last - first))` shall not overlap.

5     *Effects:* Assigns to every iterator `i` in the range `[result, result + (last - first))` either `new_value` or `*(first + (i - result))` depending on whether the following corresponding conditions hold:

```
    *(first + (i - result)) == old_value
    pred(*(first + (i - result))) != false
```

6     *Returns:* `result + (last - first)`.

7     *Complexity:* Exactly `last - first` applications of the corresponding predicate.

#### 25.4.6 Fill

[alg.fill]

```
template<class ForwardIterator, class T>
void fill(ForwardIterator first, ForwardIterator last, const T& value);
```

```
template<class OutputIterator, class Size, class T>
OutputIterator fill_n(OutputIterator first, Size n, const T& value);
```

1     *Requires:* The expression `value` shall be writable (24.2.1) to the output iterator. The type `Size` shall be convertible to an integral type (4.7, 12.3).

2     *Effects:* The first algorithm assigns `value` through all the iterators in the range `[first, last)`. The second algorithm assigns `value` through all the iterators in the range `[first, first + n)` if `n` is positive, otherwise it does nothing.

3     *Returns:* `fill_n` returns `first + n` for non-negative values of `n` and `first` for negative values.

4     *Complexity:* Exactly `last - first`, `n`, or 0 assignments, respectively.

#### 25.4.7 Generate

[alg.generate]

```
template<class ForwardIterator, class Generator>
void generate(ForwardIterator first, ForwardIterator last,
             Generator gen);
```

```
template<class OutputIterator, class Size, class Generator>
OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
```

1     *Effects:* The first algorithm invokes the function object `gen` and assigns the return value of `gen` through all the iterators in the range `[first, last)`. The second algorithm invokes the function object `gen` and assigns the return value of `gen` through all the iterators in the range `[first, first + n)` if `n` is positive, otherwise it does nothing.

- 2     *Requires:* `gen` takes no arguments, `Size` shall be convertible to an integral type (4.7, 12.3).  
 3     *Returns:* `generate_n` returns `first + n` for non-negative values of `n` and `first` for negative values.  
 4     *Complexity:* Exactly `last - first`, `n`, or 0 invocations of `gen` and assignments, respectively.

## 25.4.8 Remove

[alg.remove]

```
template<class ForwardIterator, class T>
    ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                          const T& value);
```

```
template<class ForwardIterator, class Predicate>
    ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                             Predicate pred);
```

- 1     *Requires:* The type of `*first` shall satisfy the `MoveAssignable` requirements (Table 22).  
 2     *Effects:* Eliminates all the elements referred to by iterator `i` in the range `[first, last)` for which the following corresponding conditions hold: `*i == value`, `pred(*i) != false`.  
 3     *Returns:* The end of the resulting range.  
 4     *Remarks:* Stable (17.6.5.7).  
 5     *Complexity:* Exactly `last - first` applications of the corresponding predicate.  
 6     *Note:* each element in the range `[ret, last)`, where `ret` is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range.

```
template<class InputIterator, class OutputIterator, class T>
    OutputIterator
    remove_copy(InputIterator first, InputIterator last,
               OutputIterator result, const T& value);
```

```
template<class InputIterator, class OutputIterator, class Predicate>
    OutputIterator
    remove_copy_if(InputIterator first, InputIterator last,
                   OutputIterator result, Predicate pred);
```

- 7     *Requires:* The ranges `[first, last)` and `[result, result + (last - first))` shall not overlap. The expression `*result = *first` shall be valid.  
 8     *Effects:* Copies all the elements referred to by the iterator `i` in the range `[first, last)` for which the following corresponding conditions do not hold: `*i == value`, `pred(*i) != false`.  
 9     *Returns:* The end of the resulting range.  
 10     *Complexity:* Exactly `last - first` applications of the corresponding predicate.  
 11     *Remarks:* Stable (17.6.5.7).

## 25.4.9 Unique

[alg.unique]

```
template<class ForwardIterator>
    ForwardIterator unique(ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class BinaryPredicate>
    ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                          BinaryPredicate pred);
```

- 1 *Effects:* For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range `[first + 1, last)` for which the following conditions hold: `*(i - 1) == *i` or `pred(*(i - 1), *i) != false`.
- 2 *Requires:* The comparison function shall be an equivalence relation. The type of `*first` shall satisfy the `MoveAssignable` requirements (Table 22).
- 3 *Returns:* The end of the resulting range.
- 4 *Complexity:* For nonempty ranges, exactly `(last - first) - 1` applications of the corresponding predicate.
- ```
template<class InputIterator, class OutputIterator>
    OutputIterator
        unique_copy(InputIterator first, InputIterator last,
                    OutputIterator result);

template<class InputIterator, class OutputIterator,
        class BinaryPredicate>
    OutputIterator
        unique_copy(InputIterator first, InputIterator last,
                    OutputIterator result, BinaryPredicate pred);
```
- 5 *Requires:* The comparison function shall be an equivalence relation. The ranges `[first, last)` and `[result, result+(last-first))` shall not overlap. The expression `*result = *first` shall be valid. Let `T` be the value type of `InputIterator`. If `InputIterator` meets the forward iterator requirements, then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the forward iterator requirements and its value type is the same as `T`, then `T` shall be `CopyAssignable` (Table 23). Otherwise, `T` shall be both `CopyConstructible` (Table 21) and `CopyAssignable`.
- 6 *Effects:* Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first, last)` for which the following corresponding conditions hold: `*i == *(i - 1)` or `pred(*i, *(i - 1)) != false`.
- 7 *Returns:* The end of the resulting range.
- 8 *Complexity:* For nonempty ranges, exactly `last - first - 1` applications of the corresponding predicate.

## 25.4.10 Reverse

[alg.reverse]

- ```
template<class BidirectionalIterator>
    void reverse(BidirectionalIterator first, BidirectionalIterator last);
```
- 1 *Effects:* For each non-negative integer `i < (last - first)/2`, applies `iter_swap` to all pairs of iterators `first + i`, `(last - i) - 1`.
- 2 *Requires:* `*first` shall be swappable (17.6.3.2).
- 3 *Complexity:* Exactly `(last - first)/2` swaps.
- ```
template<class BidirectionalIterator, class OutputIterator>
    OutputIterator
        reverse_copy(BidirectionalIterator first,
                    BidirectionalIterator last, OutputIterator result);
```
- 4 *Effects:* Copies the range `[first, last)` to the range `[result, result+(last-first))` such that for every non-negative integer `i < (last - first)` the following assignment takes place: `*(result + (last - first) - 1 - i) = *(first + i)`.
- 5 *Requires:* The ranges `[first, last)` and `[result, result+(last-first))` shall not overlap.

- 6 *Returns:* `result + (last - first)`.  
 7 *Complexity:* Exactly `last - first` assignments.

### 25.4.11 Rotate

[alg.rotate]

```
template<class ForwardIterator>
    ForwardIterator rotate(ForwardIterator first, ForwardIterator middle,
                          ForwardIterator last);
```

1 *Effects:* For each non-negative integer `i < (last - first)`, places the element from the position `first + i` into position `first + (i + (last - middle)) % (last - first)`.  
 2 *Returns:* `first + (last - middle)`.  
 3 *Remarks:* This is a left rotate.  
 4 *Requires:* `[first, middle)` and `[middle, last)` shall be valid ranges. `ForwardIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and the requirements of `MoveAssignable` (Table 22).  
 5 *Complexity:* At most `last - first` swaps.

```
template<class ForwardIterator, class OutputIterator>
    OutputIterator
    rotate_copy(ForwardIterator first, ForwardIterator middle,
               ForwardIterator last, OutputIterator result);
```

6 *Effects:* Copies the range `[first, last)` to the range `[result, result + (last - first))` such that for each non-negative integer `i < (last - first)` the following assignment takes place: `*(result + i) = *(first + (i + (middle - first)) % (last - first))`.  
 7 *Returns:* `result + (last - first)`.  
 8 *Requires:* The ranges `[first, last)` and `[result, result + (last - first))` shall not overlap.  
 9 *Complexity:* Exactly `last - first` assignments.

### 25.4.12 Sample

[alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
        class Distance, class UniformRandomNumberGenerator>
    SampleIterator sample(PopulationIterator first, PopulationIterator last,
                        SampleIterator out, Distance n,
                        UniformRandomNumberGenerator&& g);
```

1 *Requires:*

- (1.1) — `PopulationIterator` shall satisfy the requirements of an input iterator (24.2.3).
- (1.2) — `SampleIterator` shall satisfy the requirements of an output iterator (24.2.4).
- (1.3) — `SampleIterator` shall satisfy the additional requirements of a random access iterator (24.2.7), unless `PopulationIterator` satisfies the additional requirements of a forward iterator (24.2.5).
- (1.4) — `PopulationIterator`'s value type shall be writable (24.2.1) to `out`.
- (1.5) — `Distance` shall be an integer type.
- (1.6) — `UniformRandomNumberGenerator` shall meet the requirements of a uniform random number generator type (26.6.1.3) whose return type is convertible to `Distance`.
- (1.7) — `out` shall not be in the range `[first, last)`.

2 *Effects:* Copies `min(last - first, n)` elements (the *sample*) from `[first, last)` (the *population*) to `out` such that each possible sample has equal probability of appearance. [ *Note:* Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — *end note* ]

3 *Returns:* The end of the resulting sample range.

4 *Complexity:*  $O(\text{last} - \text{first})$ .

5 *Remarks:*

(5.1) — Stable if and only if `PopulationIterator` satisfies the requirements of a forward iterator.

(5.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` shall serve as the implementation's source of randomness.

### 25.4.13 Shuffle

[`alg.random.shuffle`]

```
template<class RandomAccessIterator, class UniformRandomNumberGenerator>
void shuffle(RandomAccessIterator first,
             RandomAccessIterator last,
             UniformRandomNumberGenerator&& g);
```

1 *Effects:* Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

2 *Requires:* `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type `UniformRandomNumberGenerator` shall meet the requirements of a uniform random number generator (26.6.1.3) type whose return type is convertible to `iterator_traits<RandomAccessIterator>::difference_type`.

3 *Complexity:* Exactly `(last - first) - 1` swaps.

4 *Remarks:* To the extent that the implementation of this function makes use of random numbers, the object `g` shall serve as the implementation's source of randomness.

### 25.4.14 Partitions

[`alg.partitions`]

```
template <class InputIterator, class Predicate>
bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
```

1 *Requires:* `InputIterator`'s value type shall be convertible to `Predicate`'s argument type.

2 *Returns:* `true` if `[first, last)` is empty or if `[first, last)` is partitioned by `pred`, i.e. if all elements that satisfy `pred` appear before those that do not.

3 *Complexity:* Linear. At most `last - first` applications of `pred`.

```
template<class ForwardIterator, class Predicate>
ForwardIterator
partition(ForwardIterator first,
          ForwardIterator last, Predicate pred);
```

4 *Effects:* Places all the elements in the range `[first, last)` that satisfy `pred` before all the elements that do not satisfy it.

5 *Returns:* An iterator `i` such that for every iterator `j` in the range `[first, i)` `pred(*j) != false`, and for every iterator `k` in the range `[i, last)`, `pred(*k) == false`.

6 *Requires:* `ForwardIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2).

7 *Complexity:* If `ForwardIterator` meets the requirements for a `BidirectionalIterator`, at most `(last - first) / 2` swaps are done; otherwise at most `last - first` swaps are done. Exactly `last - first` applications of the predicate are done.

```
template<class BidirectionalIterator, class Predicate>
```

```
    BidirectionalIterator
```

```
        stable_partition(BidirectionalIterator first,
                        BidirectionalIterator last, Predicate pred);
```

8     *Effects:* Places all the elements in the range `[first, last)` that satisfy `pred` before all the elements that do not satisfy it.

9     *Returns:* An iterator `i` such that for every iterator `j` in the range `[first, i)`, `pred(*j) != false`, and for every iterator `k` in the range `[i, last)`, `pred(*k) == false`. The relative order of the elements in both groups is preserved.

10    *Requires:* `BidirectionalIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).

11    *Complexity:* At most  $N \log(N)$  swaps, where  $N = \text{last} - \text{first}$ , but only  $\mathcal{O}(N)$  swaps if there is enough extra memory. Exactly `last - first` applications of the predicate.

```
template <class InputIterator, class OutputIterator1,
```

```
        class OutputIterator2, class Predicate>
```

```
    pair<OutputIterator1, OutputIterator2>
```

```
    partition_copy(InputIterator first, InputIterator last,
                  OutputIterator1 out_true, OutputIterator2 out_false,
                  Predicate pred);
```

12    *Requires:* `InputIterator`'s value type shall be `CopyAssignable`, and shall be writable (24.2.1) to the `out_true` and `out_false` `OutputIterators`, and shall be convertible to `Predicate`'s argument type. The input range shall not overlap with either of the output ranges.

13    *Effects:* For each iterator `i` in `[first, last)`, copies `*i` to the output range beginning with `out_true` if `pred(*i)` is true, or to the output range beginning with `out_false` otherwise.

14    *Returns:* A pair `p` such that `p.first` is the end of the output range beginning at `out_true` and `p.second` is the end of the output range beginning at `out_false`.

15    *Complexity:* Exactly `last - first` applications of `pred`.

```
template<class ForwardIterator, class Predicate>
```

```
    ForwardIterator partition_point(ForwardIterator first,
                                   ForwardIterator last,
                                   Predicate pred);
```

16    *Requires:* `ForwardIterator`'s value type shall be convertible to `Predicate`'s argument type. `[first, last)` shall be partitioned by `pred`, i.e. all elements that satisfy `pred` shall appear before those that do not.

17    *Returns:* An iterator `mid` such that `all_of(first, mid, pred)` and `none_of(mid, last, pred)` are both true.

18    *Complexity:*  $\mathcal{O}(\log(\text{last} - \text{first}))$  applications of `pred`.

## 25.5 Sorting and related operations

[alg.sorting]

1    All the operations in 25.5 have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.

2    `Compare` is a function object type (20.12). The return value of the function call operation applied to an object of type `Compare`, when contextually converted to `bool` (Clause 4), yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms

assuming an ordering relation. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.

- 3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 25.5.3, `comp` shall induce a strict weak ordering on the values.
- 4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

(4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`

(4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[*Note:* Under these conditions, it can be shown that

(4.3) — `equiv` is an equivalence relation

(4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`

(4.5) — The induced relation is a strict total ordering.

— *end note*]

- 5 A sequence is *sorted with respect to a comparator* `comp` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, `comp(*(i + n), *i) == false`.
- 6 A sequence `[start, finish)` is *partitioned with respect to an expression* `f(e)` if there exists an integer `n` such that for all `0 <= i < (finish - start)`, `f(*(start + i))` is true if and only if `i < n`.
- 7 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

## 25.5.1 Sorting

[alg.sort]

### 25.5.1.1 sort

[sort]

```
template<class RandomAccessIterator>
void sort(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
void sort(RandomAccessIterator first, RandomAccessIterator last,
          Compare comp);
```

- 1 *Effects:* Sorts the elements in the range `[first, last)`.
- 2 *Requires:* `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).
- 3 *Complexity:*  $\mathcal{O}(N \log(N))$  comparisons, where  $N = \text{last} - \text{first}$ .

**25.5.1.2 stable\_sort****[stable.sort]**

```
template<class RandomAccessIterator>
    void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
    void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);
```

- 1     *Effects:* Sorts the elements in the range `[first, last)`.
- 2     *Requires:* `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).
- 3     *Complexity:* At most  $N \log^2(N)$  comparisons, where  $N = \text{last} - \text{first}$ , but only  $N \log(N)$  comparisons if there is enough extra memory.
- 4     *Remarks:* Stable (17.6.5.7).

**25.5.1.3 partial\_sort****[partial.sort]**

```
template<class RandomAccessIterator>
    void partial_sort(RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
    void partial_sort(RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last,
                    Compare comp);
```

- 1     *Effects:* Places the first `middle - first` sorted elements from the range `[first, last)` into the range `[first, middle)`. The rest of the elements in the range `[middle, last)` are placed in an unspecified order.
- 2     *Requires:* `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).
- 3     *Complexity:* It takes approximately  $(\text{last} - \text{first}) * \log(\text{middle} - \text{first})$  comparisons.

**25.5.1.4 partial\_sort\_copy****[partial.sort.copy]**

```
template<class InputIterator, class RandomAccessIterator>
    RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                    RandomAccessIterator result_first,
                    RandomAccessIterator result_last);
```

```
template<class InputIterator, class RandomAccessIterator,
        class Compare>
    RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                    RandomAccessIterator result_first,
                    RandomAccessIterator result_last,
                    Compare comp);
```

- 1 *Effects:* Places the first  $\min(\text{last} - \text{first}, \text{result\_last} - \text{result\_first})$  sorted elements into the range  $[\text{result\_first}, \text{result\_first} + \min(\text{last} - \text{first}, \text{result\_last} - \text{result\_first}))$ .
- 2 *Returns:* The smaller of: `result_last` or `result_first + (last - first)`.
- 3 *Requires:* `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*result_first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).
- 4 *Complexity:* Approximately  $(\text{last} - \text{first}) * \log(\min(\text{last} - \text{first}, \text{result\_last} - \text{result\_first}))$  comparisons.

#### 25.5.1.5 `is_sorted`

[is.sorted]

```
template<class ForwardIterator>
bool is_sorted(ForwardIterator first, ForwardIterator last);
```

- 1 *Returns:* `is_sorted_until(first, last) == last`

```
template<class ForwardIterator, class Compare>
bool is_sorted(ForwardIterator first, ForwardIterator last,
               Compare comp);
```

- 2 *Returns:* `is_sorted_until(first, last, comp) == last`

```
template<class ForwardIterator>
ForwardIterator is_sorted_until(ForwardIterator first, ForwardIterator last);
template<class ForwardIterator, class Compare>
ForwardIterator is_sorted_until(ForwardIterator first, ForwardIterator last,
                               Compare comp);
```

- 3 *Returns:* If  $(\text{last} - \text{first}) < 2$ , returns `last`. Otherwise, returns the last iterator `i` in  $[\text{first}, \text{last}]$  for which the range  $[\text{first}, i]$  is sorted.
- 4 *Complexity:* Linear.

#### 25.5.2 `Nth element`

[alg.nth.element]

```
template<class RandomAccessIterator>
void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                 RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                 RandomAccessIterator last, Compare comp);
```

- 1 After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted, unless `nth == last`. Also for every iterator `i` in the range  $[\text{first}, \text{nth})$  and every iterator `j` in the range  $[\text{nth}, \text{last})$  it holds that:  $!(\ast j < \ast i)$  or  $\text{comp}(\ast j, \ast i) == \text{false}$ .
- 2 *Requires:* `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).
- 3 *Complexity:* Linear on average.

**25.5.3 Binary search****[alg.binary.search]**

- <sup>1</sup> All of the algorithms in this section are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the implied or explicit comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

**25.5.3.1 lower\_bound****[lower.bound]**

```
template<class ForwardIterator, class T>
ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
            const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);
```

- <sup>1</sup> *Requires:* The elements *e* of `[first, last)` shall be partitioned with respect to the expression `e < value` or `comp(e, value)`.
- <sup>2</sup> *Returns:* The furthestmost iterator *i* in the range `[first, last]` such that for every iterator *j* in the range `[first, i)` the following corresponding conditions hold: `*j < value` or `comp(*j, value) != false`.
- <sup>3</sup> *Complexity:* At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons.

**25.5.3.2 upper\_bound****[upper.bound]**

```
template<class ForwardIterator, class T>
ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
            const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);
```

- <sup>1</sup> *Requires:* The elements *e* of `[first, last)` shall be partitioned with respect to the expression `!(value < e)` or `!comp(value, e)`.
- <sup>2</sup> *Returns:* The furthestmost iterator *i* in the range `[first, last]` such that for every iterator *j* in the range `[first, i)` the following corresponding conditions hold: `!(value < *j)` or `comp(value, *j) == false`.
- <sup>3</sup> *Complexity:* At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons.

**25.5.3.3 equal\_range****[equal.range]**

```
template<class ForwardIterator, class T>
pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
```

```
pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value,
            Compare comp);
```

<sup>1</sup> *Requires:* The elements  $e$  of  $[first, last)$  shall be partitioned with respect to the expressions  $e < value$  and  $!(value < e)$  or  $comp(e, value)$  and  $!comp(value, e)$ . Also, for all elements  $e$  of  $[first, last)$ ,  $e < value$  shall imply  $!(value < e)$  or  $comp(e, value)$  shall imply  $!comp(value, e)$ .

<sup>2</sup> *Returns:*

```
make_pair(lower_bound(first, last, value),
          upper_bound(first, last, value))
```

or

```
make_pair(lower_bound(first, last, value, comp),
          upper_bound(first, last, value, comp))
```

<sup>3</sup> *Complexity:* At most  $2 * \log_2(last - first) + \mathcal{O}(1)$  comparisons.

#### 25.5.3.4 binary\_search

[binary.search]

```
template<class ForwardIterator, class T>
bool binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value);
```

```
template<class ForwardIterator, class T, class Compare>
bool binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value, Compare comp);
```

<sup>1</sup> *Requires:* The elements  $e$  of  $[first, last)$  are partitioned with respect to the expressions  $e < value$  and  $!(value < e)$  or  $comp(e, value)$  and  $!comp(value, e)$ . Also, for all elements  $e$  of  $[first, last)$ ,  $e < value$  implies  $!(value < e)$  or  $comp(e, value)$  implies  $!comp(value, e)$ .

<sup>2</sup> *Returns:* true if there is an iterator  $i$  in the range  $[first, last)$  that satisfies the corresponding conditions:  $!(i < value) \ \&\& \ !(value < *i)$  or  $comp(*i, value) == false \ \&\& \ comp(value, *i) == false$ .

<sup>3</sup> *Complexity:* At most  $\log_2(last - first) + \mathcal{O}(1)$  comparisons.

#### 25.5.4 Merge

[alg.merge]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result);
```

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result, Compare comp);
```

<sup>1</sup> *Effects:* Copies all the elements of the two ranges  $[first1, last1)$  and  $[first2, last2)$  into the range  $[result, result\_last)$ , where  $result\_last$  is  $result + (last1 - first1) + (last2 - first2)$ ,

such that the resulting range satisfies `is_sorted(result, result_last)` or `is_sorted(result, result_last, comp)`, respectively.

2 *Requires:* The ranges `[first1, last1)` and `[first2, last2)` shall be sorted with respect to `operator<` or `comp`. The resulting range shall not overlap with either of the original ranges.

3 *Returns:* `result + (last1 - first1) + (last2 - first2)`.

4 *Complexity:* At most  $(last1 - first1) + (last2 - first2) - 1$  comparisons.

5 *Remarks:* Stable (17.6.5.7).

```
template<class BidirectionalIterator>
    void inplace_merge(BidirectionalIterator first,
                      BidirectionalIterator middle,
                      BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
    void inplace_merge(BidirectionalIterator first,
                      BidirectionalIterator middle,
                      BidirectionalIterator last, Compare comp);
```

6 *Effects:* Merges two sorted consecutive ranges `[first, middle)` and `[middle, last)`, putting the result of the merge into the range `[first, last)`. The resulting range will be in non-decreasing order; that is, for every iterator `i` in `[first, last)` other than `first`, the condition `*i < *(i - 1)` or, respectively, `comp(*i, *(i - 1))` will be false.

7 *Requires:* The ranges `[first, middle)` and `[middle, last)` shall be sorted with respect to `operator<` or `comp`. `BidirectionalIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).

8 *Complexity:* When enough additional memory is available,  $(last - first) - 1$  comparisons. If no additional memory is available, an algorithm with complexity  $N \log(N)$  may be used, where  $N = last - first$ .

9 *Remarks:* Stable (17.6.5.7).

### 25.5.5 Set operations on sorted structures

[alg.set.operations]

1 This section defines all the basic set operations on sorted structures. They also work with `multisets` (23.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multisets` in a standard way by defining `set_union()` to contain the maximum number of occurrences of every element, `set_intersection()` to contain the minimum, and so on.

#### 25.5.5.1 includes

[includes]

```
template<class InputIterator1, class InputIterator2>
    bool includes(InputIterator1 first1, InputIterator1 last1,
                 InputIterator2 first2, InputIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
    bool includes(InputIterator1 first1, InputIterator1 last1,
                 InputIterator2 first2, InputIterator2 last2,
                 Compare comp);
```

1 *Returns:* `true` if `[first2, last2)` is empty or if every element in the range `[first2, last2)` is contained in the range `[first1, last1)`. Returns `false` otherwise.

2 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons.

**25.5.5.2 set\_union****[set.union]**

```

template<class InputIterator1, class InputIterator2,
        class OutputIterator>
OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result, Compare comp);

```

- 1 *Effects:* Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.
- 2 *Requires:* The resulting range shall not overlap with either of the original ranges.
- 3 *Returns:* The end of the constructed range.
- 4 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons.
- 5 *Remarks:* If  $[first1, last1)$  contains  $m$  elements that are equivalent to each other and  $[first2, last2)$  contains  $n$  elements that are equivalent to them, then all  $m$  elements from the first range shall be copied to the output range, in order, and then  $\max(n - m, 0)$  elements from the second range shall be copied to the output range, in order.

**25.5.5.3 set\_intersection****[set.intersection]**

```

template<class InputIterator1, class InputIterator2,
        class OutputIterator>
OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                 InputIterator2 first2, InputIterator2 last2,
                 OutputIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                 InputIterator2 first2, InputIterator2 last2,
                 OutputIterator result, Compare comp);

```

- 1 *Effects:* Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.
- 2 *Requires:* The resulting range shall not overlap with either of the original ranges.
- 3 *Returns:* The end of the constructed range.
- 4 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons.
- 5 *Remarks:* If  $[first1, last1)$  contains  $m$  elements that are equivalent to each other and  $[first2, last2)$  contains  $n$  elements that are equivalent to them, the first  $\min(m, n)$  elements shall be copied from the first range to the output range, in order.

**25.5.5.4 set\_difference****[set.difference]**

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
```

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
```

- 1 *Effects:* Copies the elements of the range `[first1, last1)` which are not present in the range `[first2, last2)` to the range beginning at `result`. The elements in the constructed range are sorted.
- 2 *Requires:* The resulting range shall not overlap with either of the original ranges.
- 3 *Returns:* The end of the constructed range.
- 4 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons.
- 5 *Remarks:* If `[first1, last1)` contains  $m$  elements that are equivalent to each other and `[first2, last2)` contains  $n$  elements that are equivalent to them, the last  $\max(m - n, 0)$  elements from `[first1, last1)` shall be copied to the output range.

#### 25.5.5.5 set\_symmetric\_difference

[set.symmetric.difference]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        OutputIterator result);
```

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        OutputIterator result, Compare comp);
```

- 1 *Effects:* Copies the elements of the range `[first1, last1)` that are not present in the range `[first2, last2)`, and the elements of the range `[first2, last2)` that are not present in the range `[first1, last1)` to the range beginning at `result`. The elements in the constructed range are sorted.
- 2 *Requires:* The resulting range shall not overlap with either of the original ranges.
- 3 *Returns:* The end of the constructed range.
- 4 *Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons.
- 5 *Remarks:* If `[first1, last1)` contains  $m$  elements that are equivalent to each other and `[first2, last2)` contains  $n$  elements that are equivalent to them, then  $|m - n|$  of those elements shall be copied to the output range: the last  $m - n$  of these elements from `[first1, last1)` if  $m > n$ , and the last  $n - m$  of these elements from `[first2, last2)` if  $m < n$ .

#### 25.5.6 Heap operations

[alg.heap.operations]

- 1 A *heap* is a particular organization of elements in a range between two random access iterators `[a, b)`. Its two key properties are:

- (1) There is no element greater than `*a` in the range and
- (2) `*a` may be removed by `pop_heap()`, or a new element added by `push_heap()`, in  $\mathcal{O}(\log(N))$  time.
- 2 These properties make heaps useful as priority queues.
- 3 `make_heap()` converts a range into a heap and `sort_heap()` turns a heap into a sorted sequence.

#### 25.5.6.1 `push_heap`

[push.heap]

```
template<class RandomAccessIterator>
    void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);
```

- 1 *Effects:* Places the value in the location `last - 1` into the resulting heap [`first`, `last`).
- 2 *Requires:* The range [`first`, `last - 1`) shall be a valid heap. The type of `*first` shall satisfy the `MoveConstructible` requirements (Table 20) and the `MoveAssignable` requirements (Table 22).
- 3 *Complexity:* At most  $\log(\text{last} - \text{first})$  comparisons.

#### 25.5.6.2 `pop_heap`

[pop.heap]

```
template<class RandomAccessIterator>
    void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);
```

- 1 *Requires:* The range [`first`, `last`) shall be a valid non-empty heap. `RandomAccessIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2). The type of `*first` shall satisfy the requirements of `MoveConstructible` (Table 20) and of `MoveAssignable` (Table 22).
- 2 *Effects:* Swaps the value in the location `first` with the value in the location `last - 1` and makes [`first`, `last - 1`) into a heap.
- 3 *Complexity:* At most  $2 \log(\text{last} - \text{first})$  comparisons.

#### 25.5.6.3 `make_heap`

[make.heap]

```
template<class RandomAccessIterator>
    void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);
```

- 1 *Effects:* Constructs a heap out of the range [`first`, `last`).
- 2 *Requires:* The type of `*first` shall satisfy the `MoveConstructible` requirements (Table 20) and the `MoveAssignable` requirements (Table 22).
- 3 *Complexity:* At most  $3(\text{last} - \text{first})$  comparisons.

#### 25.5.6.4 `sort_heap`

[sort.heap]

```
template<class RandomAccessIterator>
    void sort_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
    void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);
```

- 1     *Effects:* Sorts elements in the heap [first, last).  
 2     *Requires:* The range [first, last) shall be a valid heap. RandomAccessIterator shall satisfy the requirements of ValueSwappable (17.6.3.2). The type of \*first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).  
 3     *Complexity:* At most  $N \log(N)$  comparisons, where  $N = \text{last} - \text{first}$ .

#### 25.5.6.5 is\_heap

[is.heap]

```
template<class RandomAccessIterator>
    bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

- 1     *Returns:* is\_heap\_until(first, last) == last

```
template<class RandomAccessIterator, class Compare>
    bool is_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
```

- 2     *Returns:* is\_heap\_until(first, last, comp) == last

```
template<class RandomAccessIterator>
    RandomAccessIterator is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class RandomAccessIterator, class Compare>
    RandomAccessIterator is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
    Compare comp);
```

- 3     *Returns:* If (last - first) < 2, returns last. Otherwise, returns the last iterator i in [first, last] for which the range [first, i) is a heap.  
 4     *Complexity:* Linear.

#### 25.5.7 Minimum and maximum

[alg.min.max]

```
template<class T> constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
    constexpr const T& min(const T& a, const T& b, Compare comp);
```

- 1     *Requires:* For the first form, type T shall be LessThanComparable (Table 18).  
 2     *Returns:* The smaller value.  
 3     *Remarks:* Returns the first argument when the arguments are equivalent.  
 4     *Complexity:* Exactly one comparison.

```
template<class T>
    constexpr T min(initializer_list<T> t);
template<class T, class Compare>
    constexpr T min(initializer_list<T> t, Compare comp);
```

- 5     *Requires:* T shall be CopyConstructible and t.size() > 0. For the first form, type T shall be LessThanComparable.  
 6     *Returns:* The smallest value in the initializer\_list.  
 7     *Remarks:* Returns a copy of the leftmost argument when several arguments are equivalent to the smallest.  
 8     *Complexity:* Exactly t.size() - 1 comparisons.

```
template<class T> constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
    constexpr const T& max(const T& a, const T& b, Compare comp);
```

9       *Requires:* For the first form, type T shall be `LessThanComparable` (Table 18).

10       *Returns:* The larger value.

11       *Remarks:* Returns the first argument when the arguments are equivalent.

12       *Complexity:* Exactly one comparison.

```
template<class T>
    constexpr T max(initializer_list<T> t);
template<class T, class Compare>
    constexpr T max(initializer_list<T> t, Compare comp);
```

13       *Requires:* T shall be `CopyConstructible` and `t.size() > 0`. For the first form, type T shall be `LessThanComparable`.

14       *Returns:* The largest value in the `initializer_list`.

15       *Remarks:* Returns a copy of the leftmost argument when several arguments are equivalent to the largest.

16       *Complexity:* Exactly `t.size() - 1` comparisons.

```
template<class T> constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
    constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);
```

17       *Requires:* For the first form, type T shall be `LessThanComparable` (Table 18).

18       *Returns:* `pair<const T&, const T&>(b, a)` if b is smaller than a, and `pair<const T&, const T&>(a, b)` otherwise.

19       *Remarks:* Returns `pair<const T&, const T&>(a, b)` when the arguments are equivalent.

20       *Complexity:* Exactly one comparison.

```
template<class T>
    constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
    constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);
```

21       *Requires:* T shall be `CopyConstructible` and `t.size() > 0`. For the first form, type T shall be `LessThanComparable`.

22       *Returns:* `pair<T, T>(x, y)`, where x has the smallest and y has the largest value in the `initializer_list`.

23       *Remarks:* x is a copy of the leftmost argument when several arguments are equivalent to the smallest. y is a copy of the rightmost argument when several arguments are equivalent to the largest.

24       *Complexity:* At most  $(3/2)t.size()$  applications of the corresponding predicate.

```
template<class ForwardIterator>
    constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
    constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                         Compare comp);
```

25       *Returns:* The first iterator i in the range `[first, last)` such that for every iterator j in the range `[first, last)` the following corresponding conditions hold: `!(*j < *i)` or `comp(*j, *i) == false`. Returns last if `first == last`.

26       *Complexity:* Exactly `max(last - first - 1, 0)` applications of the corresponding comparisons.

```

template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
template<class ForwardIterator, class Compare>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                     Compare comp);

```

27 *Returns:* The first iterator *i* in the range `[first, last)` such that for every iterator *j* in the range `[first, last)` the following corresponding conditions hold: `!(*i < *j)` or `comp(*i, *j) == false`. Returns `last` if `first == last`.

28 *Complexity:* Exactly `max(last - first - 1, 0)` applications of the corresponding comparisons.

```

template<class ForwardIterator>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last);
template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);

```

29 *Returns:* `make_pair(first, first)` if `[first, last)` is empty, otherwise `make_pair(m, M)`, where *m* is the first iterator in `[first, last)` such that no iterator in the range refers to a smaller element, and where *M* is the last iterator <sup>272</sup> in `[first, last)` such that no iterator in the range refers to a larger element.

30 *Complexity:* At most `max(⌊ $\frac{3}{2}(N-1)$ ⌋, 0)` applications of the corresponding predicate, where *N* is `last - first`.

### 25.5.8 Bounded value

[alg.clamp]

```

template<class T>
constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);

```

1 *Requires:* For the first form, type *T* shall be `LessThanComparable` (Table 18).

2 *Returns:* The larger value of *v* and *lo* if *v* is smaller than *hi*, otherwise the smaller value of *v* and *hi*.

3 *Remarks:* Returns the first argument when it is equivalent to one of the boundary arguments.

4 *Complexity:* At most two comparisons.

### 25.5.9 Lexicographical comparison

[alg.lex.comparison]

```

template<class InputIterator1, class InputIterator2>
bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2,
                       Compare comp);

```

1 *Returns:* `true` if the sequence of elements defined by the range `[first1, last1)` is lexicographically less than the sequence of elements defined by the range `[first2, last2)` and `false` otherwise.

<sup>272</sup>) This behavior intentionally differs from `max_element()`.

2 *Complexity:* At most  $2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the corresponding comparison.

3 *Remarks:* If two sequences have the same number of elements and their corresponding elements are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

```
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (*first1 < *first2) return true;
    if (*first2 < *first1) return false;
}
return first1 == last1 && first2 != last2;
```

4 *Remarks:* An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence.

### 25.5.10 Permutation generators

[alg.permutation.generators]

```
template<class BidirectionalIterator>
    bool next_permutation(BidirectionalIterator first,
                          BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
    bool next_permutation(BidirectionalIterator first,
                          BidirectionalIterator last, Compare comp);
```

1 *Effects:* Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `operator<` or `comp`. If such a permutation exists, it returns `true`. Otherwise, it transforms the sequence into the smallest permutation, that is, the ascendingly sorted one, and returns `false`.

2 *Requires:* `BidirectionalIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2).

3 *Complexity:* At most  $(\text{last} - \text{first})/2$  swaps.

```
template<class BidirectionalIterator>
    bool prev_permutation(BidirectionalIterator first,
                          BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
    bool prev_permutation(BidirectionalIterator first,
                          BidirectionalIterator last, Compare comp);
```

4 *Effects:* Takes a sequence defined by the range `[first, last)` and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `operator<` or `comp`.

5 *Returns:* `true` if such a permutation exists. Otherwise, it transforms the sequence into the largest permutation, that is, the descendingly sorted one, and returns `false`.

6 *Requires:* `BidirectionalIterator` shall satisfy the requirements of `ValueSwappable` (17.6.3.2).

7 *Complexity:* At most  $(\text{last} - \text{first})/2$  swaps.

Table 120 — Header &lt;cstdlib&gt; synopsis

| Type       | Name(s)       |
|------------|---------------|
| Type:      | size_t        |
| Functions: | bsearch qsort |

## 25.6 C library algorithms

[alg.c.library]

- <sup>1</sup> Table 120 describes some of the contents of the header <cstdlib>.
- <sup>2</sup> The contents are the same as the Standard C library header <stdlib.h> with the following exceptions:
- <sup>3</sup> The function signature:

```
bsearch(const void *, const void *, size_t, size_t,
        int (*)(const void *, const void *));
```

is replaced by the two declarations:

```
extern "C" void* bsearch(const void* key, const void* base,
                        size_t nmemb, size_t size,
                        int (*compar)(const void*, const void*));
extern "C++" void* bsearch(const void* key, const void* base,
                          size_t nmemb, size_t size,
                          int (*compar)(const void*, const void*));
```

both of which have the same behavior as the original declaration.

- <sup>4</sup> The function signature:

```
qsort(void *, size_t, size_t,
      int (*)(const void *, const void *));
```

is replaced by the two declarations:

```
extern "C" void qsort(void* base, size_t nmemb, size_t size,
                     int (*compar)(const void*, const void*));
extern "C++" void qsort(void* base, size_t nmemb, size_t size,
                       int (*compar)(const void*, const void*));
```

both of which have the same behavior as the original declaration. The behavior is undefined unless the objects in the array pointed to by `base` are of trivial type.

[*Note:* Because the function argument `compar()` may throw an exception, `bsearch()` and `qsort()` are allowed to propagate the exception (17.6.5.12). — *end note*]

## 26 Numerics library

[numerics]

### 26.1 General

[numerics.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform seminumerical operations.
- <sup>2</sup> The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and facilities included from the ISO C library, as summarized in Table 121.

Table 121 — Numerics library summary

| Subclause                                           | Header(s)                                     |
|-----------------------------------------------------|-----------------------------------------------|
| <a href="#">26.2</a> Definitions                    |                                               |
| <a href="#">26.3</a> Requirements                   |                                               |
| <a href="#">26.4</a> Floating-Point Environment     | <cfenv>                                       |
| <a href="#">26.5</a> Complex Numbers                | <complex>                                     |
| <a href="#">26.6</a> Random number generation       | <random>                                      |
| <a href="#">26.7</a> Numeric arrays                 | <valarray>                                    |
| <a href="#">26.8</a> Generalized numeric operations | <numeric>                                     |
| <a href="#">26.9</a> C library                      | <cmath><br><ctgmth><br><tgmath.h><br><stdlib> |

### 26.2 Definitions

[numerics.defns]

- <sup>1</sup> Define *GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) as follows:
- (1.1) — *a*<sub>1</sub> when *N* is 1, otherwise
- (1.2) — *op*(*GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>),  
*GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) for any *K* where  $1 < K + 1 = M \leq N$ .
- <sup>2</sup> Define *GENERALIZED\_SUM*(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) as *GENERALIZED\_NONCOMMUTATIVE\_SUM*(*op*, *b*<sub>1</sub>, ..., *b*<sub>N</sub>) where *b*<sub>1</sub>, ..., *b*<sub>N</sub> may be any permutation of *a*<sub>1</sub>, ..., *a*<sub>N</sub>.

### 26.3 Numeric type requirements

[numeric.requirements]

- <sup>1</sup> The **complex** and **valarray** components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a type *T* that satisfies the following requirements:<sup>273</sup>
- (1.1) — *T* is not an abstract class (it has no pure virtual member functions);
- (1.2) — *T* is not a reference type;
- (1.3) — *T* is not cv-qualified;

<sup>273</sup> In other words, value types. These include arithmetic types, pointers, the library class **complex**, and instantiations of **valarray** for value types.

- (1.4) — If **T** is a class, it has a public default constructor;
- (1.5) — If **T** is a class, it has a public copy constructor with the signature **T::T(const T&)**
- (1.6) — If **T** is a class, it has a public destructor;
- (1.7) — If **T** is a class, it has a public assignment operator whose signature is either **T& T::operator=(const T&)** or **T& T::operator=(T)**
- (1.8) — If **T** is a class, its assignment operator, copy and default constructors, and destructor shall correspond to each other in the following sense: Initialization of raw storage using the default constructor, followed by assignment, is semantically equivalent to initialization of raw storage using the copy constructor. Destruction of an object, followed by initialization of its raw storage using the copy constructor, is semantically equivalent to assignment to the original object.

[*Note:* This rule states that there shall not be any subtle differences in the semantics of initialization versus assignment. This gives an implementation considerable flexibility in how arrays are initialized.

[*Example:* An implementation is allowed to initialize a **valarray** by allocating storage using the **new** operator (which implies a call to the default constructor for each element) and then assigning each element its value. Or the implementation can allocate raw storage and use the copy constructor to initialize each element. — *end example*]

If the distinction between initialization and assignment is important for a class, or if it fails to satisfy any of the other conditions listed above, the programmer should use **vector** (23.3.11) instead of **valarray** for that class; — *end note*]

- (1.9) — If **T** is a class, it does not overload unary **operator&**.
- 2 If any operation on **T** throws an exception the effects are undefined.
  - 3 In addition, many member and related functions of **valarray<T>** can be successfully instantiated and will exhibit well-defined behavior if and only if **T** satisfies additional requirements specified for each such member or related function.
  - 4 [*Example:* It is valid to instantiate **valarray<complex>**, but **operator>()** will not be successfully instantiated for **valarray<complex>** operands, since **complex** does not have any ordering operators. — *end example*]

## 26.4 The floating-point environment

[cfenv]

### 26.4.1 Header <cfenv> synopsis

[cfenv.syn]

```
namespace std {
    // types
    typedef object type fenv_t;
    typedef integer type fexcept_t;

    // functions
    int feclearexcept(int except);
    int fegetexceptflag(fexcept_t* pflag, int except);
    int feraiseexcept(int except);
    int fesetexceptflag(const fexcept_t* pflag, int except);
    int fetestexcept(int except);

    int fegetround(void);
    int fesetround(int mode);

    int fegetenv(fenv_t* penv);
    int feholdexcept(fenv_t* penv);
}
```

```

    int fesetenv(const fenv_t* penv);
    int feupdateenv(const fenv_t* penv);
}

```

- <sup>1</sup> The header also defines the macros:

```

FE_ALL_EXCEPT
FE_DIVBYZERO
FE_INEXACT
FE_INVALID
FE_OVERFLOW
FE_UNDERFLOW

FE_DOWNWARD
FE_TONEAREST
FE_TOWARDZERO
FE_UPWARD

FE_DFL_ENV

```

- <sup>2</sup> The header defines all functions, types, and macros the same as Clause 7.6 of the C standard.
- <sup>3</sup> The floating-point environment has thread storage duration (3.7.2). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding `std::thread` object (30.3.1) at the time it constructed the object. [ *Note:* That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — *end note* ]
- <sup>4</sup> A separate floating-point environment shall be maintained for each thread. Each function accesses the environment corresponding to its calling thread.

## 26.5 Complex numbers

[complex.numbers]

- <sup>1</sup> The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.
- <sup>2</sup> The effect of instantiating the template `complex` for any type other than `float`, `double`, or `long double` is unspecified. The specializations `complex<float>`, `complex<double>`, and `complex<long double>` are literal types (3.9).
- <sup>3</sup> If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.
- <sup>4</sup> If `z` is an lvalue expression of type `cv std::complex<T>` then:
- (4.1) — the expression `reinterpret_cast<cv T(&)[2]>(z)` shall be well-formed,
  - (4.2) — `reinterpret_cast<cv T(&)[2]>(z)[0]` shall designate the real part of `z`, and
  - (4.3) — `reinterpret_cast<cv T(&)[2]>(z)[1]` shall designate the imaginary part of `z`.

Moreover, if `a` is an expression of type `cv std::complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

- (4.4) — `reinterpret_cast<cv T*>(a)[2*i]` shall designate the real part of `a[i]`, and
- (4.5) — `reinterpret_cast<cv T*>(a)[2*i + 1]` shall designate the imaginary part of `a[i]`.

### 26.5.1 Header `<complex>` synopsis

[complex.syn]

```

namespace std {
    template<class T> class complex;
    template<> class complex<float>;
    template<> class complex<double>;
    template<> class complex<long double>;

    // 26.5.6, operators:
    template<class T>
        complex<T> operator+(const complex<T>&, const complex<T>&);
    template<class T> complex<T> operator+(const complex<T>&, const T&);
    template<class T> complex<T> operator+(const T&, const complex<T>&);

    template<class T> complex<T> operator-(
        const complex<T>&, const complex<T>&);
    template<class T> complex<T> operator-(const complex<T>&, const T&);
    template<class T> complex<T> operator-(const T&, const complex<T>&);

    template<class T> complex<T> operator*(
        const complex<T>&, const complex<T>&);
    template<class T> complex<T> operator*(const complex<T>&, const T&);
    template<class T> complex<T> operator*(const T&, const complex<T>&);

    template<class T> complex<T> operator/(
        const complex<T>&, const complex<T>&);
    template<class T> complex<T> operator/(const complex<T>&, const T&);
    template<class T> complex<T> operator/(const T&, const complex<T>&);

    template<class T> complex<T> operator+(const complex<T>&);
    template<class T> complex<T> operator-(const complex<T>&);

    template<class T> constexpr bool operator==(
        const complex<T>&, const complex<T>&);
    template<class T> constexpr bool operator==(const complex<T>&, const T&);
    template<class T> constexpr bool operator==(const T&, const complex<T>&);

    template<class T> constexpr bool operator!=(const complex<T>&, const complex<T>&);
    template<class T> constexpr bool operator!=(const complex<T>&, const T&);
    template<class T> constexpr bool operator!=(const T&, const complex<T>&);

    template<class T, class charT, class traits>
        basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>&, complex<T>&);

    template<class T, class charT, class traits>
        basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>&, const complex<T>&);

    // 26.5.7, values:
    template<class T> constexpr T real(const complex<T>&);
    template<class T> constexpr T imag(const complex<T>&);

    template<class T> T abs(const complex<T>&);
    template<class T> T arg(const complex<T>&);
    template<class T> T norm(const complex<T>&);

```

```

template<class T> complex<T> conj(const complex<T>&);
template<class T> complex<T> proj(const complex<T>&);
template<class T> complex<T> polar(const T&, const T& = 0);

// 26.5.8, transcendentals:
template<class T> complex<T> acos(const complex<T>&);
template<class T> complex<T> asin(const complex<T>&);
template<class T> complex<T> atan(const complex<T>&);

template<class T> complex<T> acosh(const complex<T>&);
template<class T> complex<T> asinh(const complex<T>&);
template<class T> complex<T> atanh(const complex<T>&);

template<class T> complex<T> cos (const complex<T>&);
template<class T> complex<T> cosh (const complex<T>&);
template<class T> complex<T> exp (const complex<T>&);
template<class T> complex<T> log (const complex<T>&);
template<class T> complex<T> log10(const complex<T>&);

template<class T> complex<T> pow (const complex<T>&, const T&);
template<class T> complex<T> pow (const complex<T>&, const complex<T>&);
template<class T> complex<T> pow (const T&, const complex<T>&);

template<class T> complex<T> sin (const complex<T>&);
template<class T> complex<T> sinh (const complex<T>&);
template<class T> complex<T> sqrt (const complex<T>&);
template<class T> complex<T> tan (const complex<T>&);
template<class T> complex<T> tanh (const complex<T>&);

// 26.5.10, complex literals:
inline namespace literals {
    inline namespace complex_literals {
        constexpr complex<long double> operator""il(long double);
        constexpr complex<long double> operator""il(unsigned long long);
        constexpr complex<double> operator""i(long double);
        constexpr complex<double> operator""i(unsigned long long);
        constexpr complex<float> operator""if(long double);
        constexpr complex<float> operator""if(unsigned long long);
    }
}
}

```

## 26.5.2 Class template complex

[complex]

```

namespace std {
    template<class T>
    class complex {
    public:
        typedef T value_type;

        constexpr complex(const T& re = T(), const T& im = T());
        constexpr complex(const complex&);
        template<class X> constexpr complex(const complex<X>&);

        constexpr T real() const;
        void real(T);
    };
}

```

```

constexpr T imag() const;
void imag(T);

complex<T>& operator= (const T&);
complex<T>& operator+=(const T&);
complex<T>& operator-=(const T&);
complex<T>& operator*=(const T&);
complex<T>& operator/=(const T&);

complex& operator=(const complex&);
template<class X> complex<T>& operator= (const complex<X>&);
template<class X> complex<T>& operator+=(const complex<X>&);
template<class X> complex<T>& operator-=(const complex<X>&);
template<class X> complex<T>& operator*=(const complex<X>&);
template<class X> complex<T>& operator/=(const complex<X>&);
};
}

```

- <sup>1</sup> The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

### 26.5.3 complex specializations

[complex.special]

```

namespace std {
    template<> class complex<float> {
    public:
        typedef float value_type;

        constexpr complex(float re = 0.0f, float im = 0.0f);
        constexpr explicit complex(const complex<double>&);
        constexpr explicit complex(const complex<long double>&);

        constexpr float real() const;
        void real(float);
        constexpr float imag() const;
        void imag(float);

        complex<float>& operator= (float);
        complex<float>& operator+=(float);
        complex<float>& operator-=(float);
        complex<float>& operator*=(float);
        complex<float>& operator/=(float);

        complex<float>& operator=(const complex<float>&);
        template<class X> complex<float>& operator= (const complex<X>&);
        template<class X> complex<float>& operator+=(const complex<X>&);
        template<class X> complex<float>& operator-=(const complex<X>&);
        template<class X> complex<float>& operator*=(const complex<X>&);
        template<class X> complex<float>& operator/=(const complex<X>&);
    };

    template<> class complex<double> {
    public:
        typedef double value_type;

        constexpr complex(double re = 0.0, double im = 0.0);

```

```

constexpr complex(const complex<float>&);
constexpr explicit complex(const complex<long double>&);

constexpr double real() const;
void real(double);
constexpr double imag() const;
void imag(double);

complex<double>& operator= (double);
complex<double>& operator+=(double);
complex<double>& operator-=(double);
complex<double>& operator*=(double);
complex<double>& operator/=(double);

complex<double>& operator=(const complex<double>&);
template<class X> complex<double>& operator= (const complex<X>&);
template<class X> complex<double>& operator+=(const complex<X>&);
template<class X> complex<double>& operator-=(const complex<X>&);
template<class X> complex<double>& operator*=(const complex<X>&);
template<class X> complex<double>& operator/=(const complex<X>&);
};

template<> class complex<long double> {
public:
    typedef long double value_type;

    constexpr complex(long double re = 0.0L, long double im = 0.0L);
    constexpr complex(const complex<float>&);
    constexpr complex(const complex<double>&);

    constexpr long double real() const;
    void real(long double);
    constexpr long double imag() const;
    void imag(long double);

    complex<long double>& operator=(const complex<long double>&);
    complex<long double>& operator= (long double);
    complex<long double>& operator+=(long double);
    complex<long double>& operator-=(long double);
    complex<long double>& operator*=(long double);
    complex<long double>& operator/=(long double);

    template<class X> complex<long double>& operator= (const complex<X>&);
    template<class X> complex<long double>& operator+=(const complex<X>&);
    template<class X> complex<long double>& operator-=(const complex<X>&);
    template<class X> complex<long double>& operator*=(const complex<X>&);
    template<class X> complex<long double>& operator/=(const complex<X>&);
};
}

```

#### 26.5.4 complex member functions

[complex.members]

```
template<class T> constexpr complex(const T& re = T(), const T& im = T());
```

- <sup>1</sup> *Effects:* Constructs an object of class `complex`.
- <sup>2</sup> *Postcondition:* `real() == re && imag() == im`.

```
constexpr T real() const;
```

*Returns:* The value of the real component.

```
void real(T val);
```

*Effects:* Assigns `val` to the real component.

```
constexpr T imag() const;
```

*Returns:* The value of the imaginary component.

```
void imag(T val);
```

*Effects:* Assigns `val` to the imaginary component.

## 26.5.5 complex member operators

[complex.member.ops]

```
complex<T>& operator+=(const T& rhs);
```

1 *Effects:* Adds the scalar value `rhs` to the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

2 *Returns:* `*this`.

```
complex<T>& operator-=(const T& rhs);
```

3 *Effects:* Subtracts the scalar value `rhs` from the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

4 *Returns:* `*this`.

```
complex<T>& operator*=(const T& rhs);
```

5 *Effects:* Multiplies the scalar value `rhs` by the complex value `*this` and stores the result in `*this`.

6 *Returns:* `*this`.

```
complex<T>& operator/=(const T& rhs);
```

7 *Effects:* Divides the scalar value `rhs` into the complex value `*this` and stores the result in `*this`.

8 *Returns:* `*this`.

```
template<class X> complex<T>& operator+=(const complex<X>& rhs);
```

9 *Effects:* Adds the complex value `rhs` to the complex value `*this` and stores the sum in `*this`.

10 *Returns:* `*this`.

```
template<class X> complex<T>& operator-=(const complex<X>& rhs);
```

11 *Effects:* Subtracts the complex value `rhs` from the complex value `*this` and stores the difference in `*this`.

12 *Returns:* `*this`.

```
template<class X> complex<T>& operator*=(const complex<X>& rhs);
```

13 *Effects:* Multiplies the complex value `rhs` by the complex value `*this` and stores the product in `*this`.  
*Returns:* `*this`.

```
template<class X> complex<T>& operator/=(const complex<X>& rhs);
```

14 *Effects:* Divides the complex value `rhs` into the complex value `*this` and stores the quotient in `*this`.

15 *Returns:* `*this`.

**26.5.6 complex non-member operations****[complex.ops]**

```
template<class T> complex<T> operator+(const complex<T>& lhs);
```

1     *Remarks:* unary operator.

2     *Returns:* complex<T>(lhs).

```
template<class T>
    complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> complex<T> operator+(const T& lhs, const complex<T>& rhs);
```

3     *Returns:* complex<T>(lhs) += rhs.

```
template<class T> complex<T> operator-(const complex<T>& lhs);
```

4     *Remarks:* unary operator.

5     *Returns:* complex<T>(-lhs.real(), -lhs.imag()).

```
template<class T>
    complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> complex<T> operator-(const T& lhs, const complex<T>& rhs);
```

6     *Returns:* complex<T>(lhs) -= rhs.

```
template<class T>
    complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> complex<T> operator*(const T& lhs, const complex<T>& rhs);
```

7     *Returns:* complex<T>(lhs) \*= rhs.

```
template<class T>
    complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> complex<T> operator/(const T& lhs, const complex<T>& rhs);
```

8     *Returns:* complex<T>(lhs) /= rhs.

```
template<class T>
    constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
template<class T> constexpr bool operator==(const T& lhs, const complex<T>& rhs);
```

9     *Returns:* lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

10    *Remarks:* The imaginary part is assumed to be T(), or 0.0, for the T arguments.

```
template<class T>
    constexpr bool operator!=(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator!=(const complex<T>& lhs, const T& rhs);
template<class T> constexpr bool operator!=(const T& lhs, const complex<T>& rhs);
```

11    *Returns:* rhs.real() != lhs.real() || rhs.imag() != lhs.imag().

```
template<class T, class charT, class traits>
    basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, complex<T>& x);
```

12 *Effects:* Extracts a complex number `x` of the form: `u`, `(u)`, or `(u,v)`, where `u` is the real part and `v` is the imaginary part (27.7.2.2).

13 *Requires:* The input values shall be convertible to `T`.  
If bad input is encountered, calls `is.setstate(ios_base::failbit)` (which may throw `ios::failure` (27.5.5.4)).

14 *Returns:* `is`.

15 *Remarks:* This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

```
template<class T, class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
```

16 *Effects:* inserts the complex number `x` onto the stream `o` as if it were implemented as follows:

```
template<class T, class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& o, const complex<T>& x) {
    basic_ostringstream<charT, traits> s;
    s.flags(o.flags());
    s.imbue(o.getloc());
    s.precision(o.precision());
    s << '(' << x.real() << "," << x.imag() << ')';
    return o << s.str();
}
```

17 *Note:* In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting `std::showpoint` into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously.

## 26.5.7 complex value operations

[complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
```

1 *Returns:* `x.real()`.

```
template<class T> constexpr T imag(const complex<T>& x);
```

2 *Returns:* `x.imag()`.

```
template<class T> T abs(const complex<T>& x);
```

3 *Returns:* The magnitude of `x`.

```
template<class T> T arg(const complex<T>& x);
```

4 *Returns:* The phase angle of `x`, or `atan2(imag(x), real(x))`.

```
template<class T> T norm(const complex<T>& x);
```

5 *Returns:* The squared magnitude of `x`.

```
template<class T> complex<T> conj(const complex<T>& x);
```

6 *Returns:* The complex conjugate of `x`.

```
template<class T> complex<T> proj(const complex<T>& x);
```

7     *Returns:* The projection of `x` onto the Riemann sphere.

8     *Remarks:* Behaves the same as the C function `cproj`, defined in 7.3.9.4.

```
template<class T> complex<T> polar(const T& rho, const T& theta = 0);
```

9     *Requires:* `rho` shall be non-negative and non-NaN. `theta` shall be finite.

10    *Returns:* The `complex` value corresponding to a complex number whose magnitude is `rho` and whose phase angle is `theta`.

## 26.5.8 complex transcendentals

[`complex.transcendentals`]

```
template<class T> complex<T> acos(const complex<T>& x);
```

1     *Returns:* The complex arc cosine of `x`.

2     *Remarks:* Behaves the same as C function `cacos`, defined in 7.3.5.1.

```
template<class T> complex<T> asin(const complex<T>& x);
```

3     *Returns:* The complex arc sine of `x`.

4     *Remarks:* Behaves the same as C function `casin`, defined in 7.3.5.2.

```
template<class T> complex<T> atan(const complex<T>& x);
```

5     *Returns:* The complex arc tangent of `x`.

6     *Remarks:* Behaves the same as C function `catan`, defined in 7.3.5.3.

```
template<class T> complex<T> acosh(const complex<T>& x);
```

7     *Returns:* The complex arc hyperbolic cosine of `x`.

8     *Remarks:* Behaves the same as C function `cacosh`, defined in 7.3.6.1.

```
template<class T> complex<T> asinh(const complex<T>& x);
```

9     *Returns:* The complex arc hyperbolic sine of `x`.

10    *Remarks:* Behaves the same as C function `casinh`, defined in 7.3.6.2.

```
template<class T> complex<T> atanh(const complex<T>& x);
```

11    *Returns:* The complex arc hyperbolic tangent of `x`.

12    *Remarks:* Behaves the same as C function `catanh`, defined in 7.3.6.3.

```
template<class T> complex<T> cos(const complex<T>& x);
```

13    *Returns:* The complex cosine of `x`.

```
template<class T> complex<T> cosh(const complex<T>& x);
```

14    *Returns:* The complex hyperbolic cosine of `x`.

```
template<class T> complex<T> exp(const complex<T>& x);
```

15    *Returns:* The complex base-*e* exponential of `x`.

```
template<class T> complex<T> log(const complex<T>& x);
```

- 16 *Remarks:* The branch cuts are along the negative real axis.
- 17 *Returns:* The complex natural (base- $e$ ) logarithm of  $x$ . For all  $x$ , `imag(log(x))` lies in the interval  $[-\pi, \pi]$ , and when  $x$  is a negative real number, `imag(log(x))` is  $\pi$ .

```
template<class T> complex<T> log10(const complex<T>& x);
```

- 18 *Remarks:* The branch cuts are along the negative real axis.
- 19 *Returns:* The complex common (base-10) logarithm of  $x$ , defined as  $\log(x) / \log(10)$ .

```
template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> complex<T> pow(const complex<T>& x, const T& y);
template<class T> complex<T> pow(const T& x, const complex<T>& y);
```

- 20 *Remarks:* The branch cuts are along the negative real axis.
- 21 *Returns:* The complex power of base  $x$  raised to the  $y^{\text{th}}$  power, defined as  $\exp(y * \log(x))$ . The value returned for `pow(0, 0)` is implementation-defined.

```
template<class T> complex<T> sin(const complex<T>& x);
```

- 22 *Returns:* The complex sine of  $x$ .

```
template<class T> complex<T> sinh(const complex<T>& x);
```

- 23 *Returns:* The complex hyperbolic sine of  $x$ .

```
template<class T> complex<T> sqrt(const complex<T>& x);
```

- 24 *Remarks:* The branch cuts are along the negative real axis.
- 25 *Returns:* The complex square root of  $x$ , in the range of the right half-plane. If the argument is a negative real number, the value returned lies on the positive imaginary axis.

```
template<class T> complex<T> tan(const complex<T>& x);
```

- 26 *Returns:* The complex tangent of  $x$ .

```
template<class T> complex<T> tanh(const complex<T>& x);
```

- 27 *Returns:* The complex hyperbolic tangent of  $x$ .

### 26.5.9 Additional overloads

[`cmplx.over`]

- 1 The following function templates shall have additional overloads:

|                   |                   |
|-------------------|-------------------|
| <code>arg</code>  | <code>norm</code> |
| <code>conj</code> | <code>proj</code> |
| <code>imag</code> | <code>real</code> |

- 2 The additional overloads shall be sufficient to ensure:

1. If the argument has type `long double`, then it is effectively cast to `complex<long double>`.
2. Otherwise, if the argument has type `double` or an integer type, then it is effectively cast to `complex<double>`.
3. Otherwise, if the argument has type `float`, then it is effectively cast to `complex<float>`.

- 3 Function template `pow` shall have additional overloads sufficient to ensure, for a call with at least one argument of type `complex<T>`:

1. If either argument has type `complex<long double>` or type `long double`, then both arguments are effectively cast to `complex<long double>`.
2. Otherwise, if either argument has type `complex<double>`, `double`, or an integer type, then both arguments are effectively cast to `complex<double>`.
3. Otherwise, if either argument has type `complex<float>` or `float`, then both arguments are effectively cast to `complex<float>`.

### 26.5.10 Suffixes for complex number literals [complex.literals]

- 1 This section describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

- 2 *Returns:* `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

- 3 *Returns:* `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

- 4 *Returns:* `complex<float>{0.0f, static_cast<float>(d)}`.

### 26.5.11 Header `<complex>` [ccmplx]

- 1 The header behaves as if it simply includes the header `<complex>`.

## 26.6 Random number generation [rand]

- 1 This subclause defines a facility for generating (pseudo-)random numbers.
- 2 In addition to a few utilities, four categories of entities are described: *uniform random number generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that satisfy the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated. [ *Note:* These entities are specified in such a way as to permit the binding of any uniform random number generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d,e)`. — *end note* ]
- 3 Each of the entities specified via this subclause has an associated arithmetic type (3.9.1) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

- a) as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;
- b) otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;
- c) otherwise as *floating* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

- 4 Unless otherwise specified, all descriptions of calculations in this subclause use mathematical real numbers.

- <sup>5</sup> Throughout this subclause, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:
- a) the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
  - b) the operator `lshiftw` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo  $2^w$ .

## 26.6.1 Requirements [rand.req]

### 26.6.1.1 General requirements [rand.req.genl]

- <sup>1</sup> Throughout this subclause 26.6, the effect of instantiating a template:
- a) that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of seed sequence (26.6.1.2).
  - b) that has a template type parameter named `URNG` is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of uniform random number generator (26.6.1.3).
  - c) that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of random number engine (26.6.1.4).
  - d) that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.
  - e) that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
  - f) that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
- <sup>2</sup> Throughout this subclause 26.6, phrases of the form “`x` is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “`x` is a value of a type satisfying the requirements of the specified iterator type.”
- <sup>3</sup> Throughout this subclause 26.6, any constructor that can be called with a single argument and that satisfies a requirement specified in this subclause shall be declared `explicit`.

### 26.6.1.2 Seed sequence requirements [rand.req.seedseq]

- <sup>1</sup> A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values  $i$ ,  $0 \leq i < 2^{32}$ , based on the consumed data. [Note: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. —end note]
- <sup>2</sup> A class `S` satisfies the requirements of a seed sequence if the expressions shown in Table 122 are valid and have the indicated semantics, and if `S` also satisfies all other requirements of this section 26.6.1.2. In that Table and throughout this section:
- a) `T` is the type named by `S`’s associated `result_type`;
  - b) `q` is a value of `S` and `r` is a possibly `const` value of `S`;
  - c) `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;

- d) **rb** and **re** are mutable random access iterators with an unsigned integer **value\_type** of at least 32 bits;
- e) **ob** is an output iterator; and
- f) **il** is a value of `initializer_list<T>`.

Table 122 — Seed sequence requirements

| Expression                     | Return type         | Pre/post-condition                                                                                                                                                                                                                                                           | Complexity                                   |
|--------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <code>S::result_type</code>    | <code>T</code>      | <code>T</code> is an unsigned integer type (3.9.1) of at least 32 bits.                                                                                                                                                                                                      | compile-time                                 |
| <code>S()</code>               |                     | Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type <code>S</code> .                                                                                                                                                 | constant                                     |
| <code>S(ib,ie)</code>          |                     | Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence <code>[ib,ie)</code> .                                                                                                                                        | $\mathcal{O}(\text{ie} - \text{ib})$         |
| <code>S(il)</code>             |                     | Same as <code>S(il.begin(), il.end())</code> .                                                                                                                                                                                                                               | same as <code>S(il.begin(), il.end())</code> |
| <code>q.generate(rb,re)</code> | <code>void</code>   | Does nothing if <code>rb == re</code> . Otherwise, fills the supplied sequence <code>[rb,re)</code> with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of <code>generate</code> 's previous invocations. | $\mathcal{O}(\text{re} - \text{rb})$         |
| <code>r.size()</code>          | <code>size_t</code> | The number of 32-bit units that would be copied by a call to <code>r.param</code> .                                                                                                                                                                                          | constant                                     |
| <code>r.param(ob)</code>       | <code>void</code>   | Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type <code>S</code> , and that would reproduce in that second object a state indistinguishable from the state of the first object.                  | $\mathcal{O}(\text{r.size}())$               |

### 26.6.1.3 Uniform random number generator requirements

[rand.req.urng]

- <sup>1</sup> A *uniform random number generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned. [ *Note*: The degree to which `g`'s results approximate the ideal is often determined statistically. — *end note* ]
- <sup>2</sup> A class `G` satisfies the requirements of a *uniform random number generator* if the expressions shown in Table 123 are valid and have the indicated semantics, and if `G` also satisfies all other requirements of this

section 26.6.1.3. In that Table and throughout this section:

- a) `T` is the type named by `G`'s associated `result_type`, and
- b) `g` is a value of `G`.

Table 123 — Uniform random number generator requirements

| Expression                  | Return type    | Pre/post-condition                                                           | Complexity         |
|-----------------------------|----------------|------------------------------------------------------------------------------|--------------------|
| <code>G::result_type</code> | <code>T</code> | <code>T</code> is an unsigned integer type (3.9.1).                          | compile-time       |
| <code>g()</code>            | <code>T</code> | Returns a value in the closed interval <code>[G::min(), G::max()]</code> .   | amortized constant |
| <code>G::min()</code>       | <code>T</code> | Denotes the least value potentially returned by <code>operator()</code> .    | compile-time       |
| <code>G::max()</code>       | <code>T</code> | Denotes the greatest value potentially returned by <code>operator()</code> . | compile-time       |

- <sup>3</sup> The following relation shall hold: `G::min() < G::max()`.

#### 26.6.1.4 Random number engine requirements

[rand.req.eng]

- <sup>1</sup> A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random number generator that additionally meets the requirements (*e.g.*, for seeding and for input/output) specified in this section.
- <sup>2</sup> At any given time, `e` has a state `ei` for some integer  $i \geq 0$ . Upon construction, `e` has an initial state `e0`. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.
- <sup>3</sup> `E`'s specification shall define:
- a) the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;
  - b) the *transition algorithm* `TA` by which `e`'s state `ei` is advanced to its *successor state* `ei+1`; and
  - c) the *generation algorithm* `GA` by which an engine's state is mapped to a value of type `result_type`.
- <sup>4</sup> A class `E` that satisfies the requirements of a uniform random number generator (26.6.1.3) also satisfies the requirements of a *random number engine* if the expressions shown in Table 124 are valid and have the indicated semantics, and if `E` also satisfies all other requirements of this section 26.6.1.4. In that Table and throughout this section:
- a) `T` is the type named by `E`'s associated `result_type`;
  - b) `e` is a value of `E`, `v` is an lvalue of `E`, `x` and `y` are (possibly `const`) values of `E`;
  - c) `s` is a value of `T`;
  - d) `q` is an lvalue satisfying the requirements of a seed sequence (26.6.1.2);
  - e) `z` is a value of type `unsigned long long`;
  - f) `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

g) `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`; where `charT` and `traits` are constrained according to Clause 21 and Clause 27.

Table 124 — Random number engine requirements

| Expression                               | Return type       | Pre/post-condition                                                                                                                                                                                                                                                                                                                                                 | Complexity                                                                                       |
|------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <code>E()</code>                         |                   | Creates an engine with the same initial state as all other default-constructed engines of type <code>E</code> .                                                                                                                                                                                                                                                    | $\mathcal{O}(\text{size of state})$                                                              |
| <code>E(x)</code>                        |                   | Creates an engine that compares equal to <code>x</code> .                                                                                                                                                                                                                                                                                                          | $\mathcal{O}(\text{size of state})$                                                              |
| <code>E(s)</code>                        |                   | Creates an engine with initial state determined by <code>s</code> .                                                                                                                                                                                                                                                                                                | $\mathcal{O}(\text{size of state})$                                                              |
| <code>E(q)</code> <sup>274</sup>         |                   | Creates an engine with an initial state that depends on a sequence produced by one call to <code>q.generate</code> .                                                                                                                                                                                                                                               | same as complexity of <code>q.generate</code> called on a sequence whose length is size of state |
| <code>e.seed()</code>                    | <code>void</code> | post: <code>e == E()</code> .                                                                                                                                                                                                                                                                                                                                      | same as <code>E()</code>                                                                         |
| <code>e.seed(s)</code>                   | <code>void</code> | post: <code>e == E(s)</code> .                                                                                                                                                                                                                                                                                                                                     | same as <code>E(s)</code>                                                                        |
| <code>e.seed(q)</code>                   | <code>void</code> | post: <code>e == E(q)</code> .                                                                                                                                                                                                                                                                                                                                     | same as <code>E(q)</code>                                                                        |
| <code>e()</code>                         | <code>T</code>    | Advances <code>e</code> 's state <code>e<sub>i</sub></code> to <code>e<sub>i+1</sub></code> = <code>TA(e<sub>i</sub>)</code> and returns <code>GA(e<sub>i</sub>)</code> .                                                                                                                                                                                          | per Table 123                                                                                    |
| <code>e.discard(z)</code> <sup>275</sup> | <code>void</code> | Advances <code>e</code> 's state <code>e<sub>i</sub></code> to <code>e<sub>i+z</sub></code> by any means equivalent to <code>z</code> consecutive calls <code>e()</code> .                                                                                                                                                                                         | no worse than the complexity of <code>z</code> consecutive calls <code>e()</code>                |
| <code>x == y</code>                      | <code>bool</code> | This operator is an equivalence relation. With <code>S<sub>x</sub></code> and <code>S<sub>y</sub></code> as the infinite sequences of values that would be generated by repeated future calls to <code>x()</code> and <code>y()</code> , respectively, returns <code>true</code> if <code>S<sub>x</sub> = S<sub>y</sub></code> ; else returns <code>false</code> . | $\mathcal{O}(\text{size of state})$                                                              |
| <code>x != y</code>                      | <code>bool</code> | <code>!(x == y)</code> .                                                                                                                                                                                                                                                                                                                                           | $\mathcal{O}(\text{size of state})$                                                              |

274) This constructor (as well as the subsequent corresponding `seed()` function) may be particularly useful to applications requiring a large number of independent random sequences.

275) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes `z` consecutive calls `e()`.

| Expression                 | Return type                                 | Pre/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Complexity                          |
|----------------------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <code>os &lt;&lt; x</code> | reference to the type of<br><code>os</code> | With <code>os.fmtflags</code> set to <code>ios_base::dec ios_base::left</code> and the fill character set to the space character, writes to <code>os</code> the textual representation of <code>x</code> 's current state. In the output, adjacent numbers are separated by one or more space characters.<br>post: The <code>os.fmtflags</code> and fill character are unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | $\mathcal{O}(\text{size of state})$ |
| <code>is &gt;&gt; v</code> | reference to the type of<br><code>is</code> | With <code>is.fmtflags</code> set to <code>ios_base::dec</code> , sets <code>v</code> 's state as determined by reading its textual representation from <code>is</code> . If bad input is encountered, ensures that <code>v</code> 's state is unchanged by the operation and calls <code>is.setstate(ios::failbit)</code> (which may throw <code>ios::failure</code> [27.5.5.4]). If a textual representation written via <code>os &lt;&lt; x</code> was subsequently read via <code>is &gt;&gt; v</code> , then <code>x == v</code> provided that there have been no intervening invocations of <code>x</code> or of <code>v</code> .<br>pre: <code>is</code> provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of <code>is</code> , and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were respectively the same as those of <code>is</code> .<br>post: The <code>is.fmtflags</code> are unchanged. | $\mathcal{O}(\text{size of state})$ |

<sup>5</sup> E shall meet the requirements of `CopyConstructible` (Table 21) and `CopyAssignable` (Table 23) types. These operations shall each be of complexity no worse than  $\mathcal{O}(\text{size of state})$ .

#### 26.6.1.5 Random number engine adaptor requirements

[rand.req.adapt]

<sup>1</sup> A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.

- 2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

`A::A();`

- 3 *Effects:* The base engine is initialized as if by its default constructor.

`bool operator==(const A& a1, const A& a2);`

- 4 *Returns:* `true` if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns `false`.

`A::A(result_type s);`

- 5 *Effects:* The base engine is initialized with `s`.

`template<class Sseq> void A::A(Sseq& q);`

- 6 *Effects:* The base engine is initialized with `q`.

`void seed();`

- 7 *Effects:* With `b` as the base engine, invokes `b.seed()`.

`void seed(result_type s);`

- 8 *Effects:* With `b` as the base engine, invokes `b.seed(s)`.

`template<class Sseq> void seed(Sseq& q);`

- 9 *Effects:* With `b` as the base engine, invokes `b.seed(q)`.

- 10 `A` shall also satisfy the following additional requirements:

- a) The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
- b) The state of `A` shall include the state of its base engine. The size of `A`'s state shall be no less than the size of the base engine.
- c) Copying `A`'s state (*e.g.*, during copy construction or copy assignment) shall include copying the state of the base engine of `A`.
- d) The textual representation of `A` shall include the textual representation of its base engine.

#### 26.6.1.6 Random number distribution requirements

[rand.req.dist]

- 1 A *random number distribution* (commonly shortened to *distribution*) `d` of type `D` is a function object returning values that are distributed according to an associated mathematical *probability density function*  $p(z)$  or according to an associated *discrete probability function*  $P(z_i)$ . A distribution's specification identifies its associated probability function  $p(z)$  or  $P(z_i)$ .
- 2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example,  $p(z | a, b)$  or  $P(z_i | a, b)$ , to name specific parameters, or by writing, for example,  $p(z | \{p\})$  or  $P(z_i | \{p\})$ , to denote a distribution's parameters `p` taken as a whole.
- 3 A class `D` satisfies the requirements of a *random number distribution* if the expressions shown in Table 125 are valid and have the indicated semantics, and if `D` and its associated types also satisfy all other requirements of this section 26.6.1.6. In that Table and throughout this section,

- a) `T` is the type named by `D`'s associated `result_type`;

- b) **P** is the type named by **D**'s associated `param_type`;
- c) **d** is a value of **D**, and **x** and **y** are (possibly `const`) values of **D**;
- d) **glb** and **lub** are values of **T** respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by **d**'s `operator()`, as determined by the current values of **d**'s parameters;
- e) **p** is a (possibly `const`) value of **P**;
- f) **g**, **g1**, and **g2** are lvalues of a type satisfying the requirements of a uniform random number generator [26.6.1.3];
- g) **os** is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
- h) **is** is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clauses 21 and 27.

Table 125 — Random number distribution requirements

| Expression                  | Return type       | Pre/post-condition                                                                                                                                                                                                                            | Complexity                                           |
|-----------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| <code>D::result_type</code> | <b>T</b>          | <b>T</b> is an arithmetic type (3.9.1).                                                                                                                                                                                                       | compile-time                                         |
| <code>D::param_type</code>  | <b>P</b>          |                                                                                                                                                                                                                                               | compile-time                                         |
| <code>D()</code>            |                   | Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type <b>D</b> .                                                                                                   | constant                                             |
| <code>D(p)</code>           |                   | Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct <b>p</b> .                                                                                | same as <b>p</b> 's construction                     |
| <code>d.reset()</code>      | <code>void</code> | Subsequent uses of <b>d</b> do not depend on values produced by any engine prior to invoking <code>reset</code> .                                                                                                                             | constant                                             |
| <code>x.param()</code>      | <b>P</b>          | Returns a value <b>p</b> such that <code>D(p).param() == p</code> .                                                                                                                                                                           | no worse than the complexity of <code>D(p)</code>    |
| <code>d.param(p)</code>     | <code>void</code> | post: <code>d.param() == p</code> .                                                                                                                                                                                                           | no worse than the complexity of <code>D(p)</code>    |
| <code>d(g)</code>           | <b>T</b>          | With <code>p = d.param()</code> , the sequence of numbers returned by successive invocations with the same object <b>g</b> is randomly distributed according to the associated $p(z   \{\mathbf{p}\})$ or $P(z_i   \{\mathbf{p}\})$ function. | amortized constant number of invocations of <b>g</b> |

| Expression                 | Return type                              | Pre/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Complexity                                                 |
|----------------------------|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <code>d(g,p)</code>        | T                                        | The sequence of numbers returned by successive invocations with the same objects <code>g</code> and <code>p</code> is randomly distributed according to the associated $p(z   \{p\})$ or $P(z_i   \{p\})$ function.                                                                                                                                                                                                                                                                                                                                                                                                                              | amortized constant number of invocations of <code>g</code> |
| <code>x.min()</code>       | T                                        | Returns <code>glb</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | constant                                                   |
| <code>x.max()</code>       | T                                        | Returns <code>lub</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | constant                                                   |
| <code>x == y</code>        | bool                                     | This operator is an equivalence relation. Returns <code>true</code> if <code>x.param() == y.param()</code> and $S_1 = S_2$ , where $S_1$ and $S_2$ are the infinite sequences of values that would be generated, respectively, by repeated future calls to <code>x(g1)</code> and <code>y(g2)</code> whenever <code>g1 == g2</code> . Otherwise returns <code>false</code> .                                                                                                                                                                                                                                                                     | constant                                                   |
| <code>x != y</code>        | bool                                     | <code>!(x == y)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | same as <code>x == y</code> .                              |
| <code>os &lt;&lt; x</code> | reference to the type of <code>os</code> | Writes to <code>os</code> a textual representation for the parameters and the additional internal data of <code>x</code> .<br>post: The <code>os.fmtflags</code> and fill character are unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                            |
| <code>is &gt;&gt; d</code> | reference to the type of <code>is</code> | Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code> . If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls<br><code>is.setstate(ios::failbit)</code><br>(which may throw <code>ios::failure</code> [27.5.5.4]).<br>pre: <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code> .<br>post: The <code>is.fmtflags</code> are unchanged. |                                                            |

<sup>4</sup> D shall satisfy the requirements of `CopyConstructible` (Table 21) and `CopyAssignable` (Table 23) types.

<sup>5</sup> The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of D between any of the invocations `d(g)`.

- <sup>6</sup> If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
- <sup>7</sup> It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 26.6, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
- <sup>8</sup> `P` shall satisfy the requirements of `CopyConstructible` (Table 21), `CopyAssignable` (Table 23), and `EqualityComparable` (Table 17) types.
- <sup>9</sup> For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.
- <sup>10</sup> `P` shall have a declaration of the form

```
typedef D distribution_type;
```

### 26.6.3 Random number engine class templates

[rand.eng]

- <sup>1</sup> Each type instantiated from a class template specified in this section 26.6.3 satisfies the requirements of a random number engine (26.6.1.4) type.
- <sup>2</sup> Except where specified otherwise, the complexity of each function specified in this section 26.6.3 is constant.
- <sup>3</sup> Except where specified otherwise, no function described in this section 26.6.3 throws an exception.
- <sup>4</sup> Descriptions are provided in this section 26.6.3 only for engine operations that are not described in 26.6.1.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

- 5 Each template specified in this section 26.6.3 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.
- 6 For every random number engine and for every random number engine adaptor **X** defined in this sub-clause (26.6.3) and in sub-clause 26.6.4:
- (6.1) — if the constructor

```
template <class Sseq> explicit X(Sseq& q);
```

is called with a type **Sseq** that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

- (6.2) — if the member function

```
template <class Sseq> void seed(Sseq& q);
```

is called with a type **Sseq** that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to **X::result\_type**.

### 26.6.3.1 Class template **linear\_congruential\_engine** [rand.eng.lcong]

- <sup>1</sup> A **linear\_congruential\_engine** random number engine produces unsigned integer random numbers. The state  $x_i$  of a **linear\_congruential\_engine** object **x** is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form  $TA(x_i) = (a \cdot x_i + c) \bmod m$ ; the generation algorithm is  $GA(x_i) = x_{i+1}$ .

```
template<class UIntType, UIntType a, UIntType c, UIntType m>
class linear_congruential_engine
{
public:
    // types
    typedef UIntType result_type;

    // engine characteristics
    static constexpr result_type multiplier = a;
    static constexpr result_type increment = c;
    static constexpr result_type modulus = m;
    static constexpr result_type min() { return c == 0u ? 1u: 0u; }
    static constexpr result_type max() { return m - 1u; }
    static constexpr result_type default_seed = 1u;

    // constructors and seeding functions
    explicit linear_congruential_engine(result_type s = default_seed);
    template<class Sseq> explicit linear_congruential_engine(Sseq& q);
    void seed(result_type s = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
};
```

<sup>2</sup> If the template parameter `m` is 0, the modulus  $m$  used throughout this section 26.6.3.1 is `numeric_limits<result_type>::max()` plus 1. [Note:  $m$  need not be representable as a value of type `result_type`. — end note]

<sup>3</sup> If the template parameter `m` is not 0, the following relations shall hold:  $a < m$  and  $c < m$ .

<sup>4</sup> The textual representation consists of the value of  $x_i$ .

```
explicit linear_congruential_engine(result_type s = default_seed);
```

<sup>5</sup> *Effects:* Constructs a `linear_congruential_engine` object. If  $c \bmod m$  is 0 and  $s \bmod m$  is 0, sets the engine's state to 1, otherwise sets the engine's state to  $s \bmod m$ .

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

<sup>6</sup> *Effects:* Constructs a `linear_congruential_engine` object. With  $k = \left\lceil \frac{\log_2 m}{32} \right\rceil$  and  $a$  an array (or equivalent) of length  $k + 3$ , invokes `q.generate(a + 0, a + k + 3)` and then computes  $S = \left( \sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$ . If  $c \bmod m$  is 0 and  $S$  is 0, sets the engine's state to 1, else sets the engine's state to  $S$ .

### 26.6.3.2 Class template `mersenne_twister_engine` [rand.eng.mers]

<sup>1</sup> A `mersenne_twister_engine` random number engine<sup>276</sup> produces unsigned integer random numbers in the closed interval  $[0, 2^w - 1]$ . The state  $x_i$  of a `mersenne_twister_engine` object  $x$  is of size  $n$  and consists of a sequence  $X$  of  $n$  values of the type delivered by  $x$ ; all subscripts applied to  $X$  are to be taken modulo  $n$ .

<sup>2</sup> The transition algorithm employs a twisted generalized feedback shift register defined by shift values  $n$  and  $m$ , a twist value  $r$ , and a conditional xor-mask  $a$ . To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values  $u, d, s, b, t, c$ , and  $\ell$ .

The state transition is performed as follows:

- a) Concatenate the upper  $w - r$  bits of  $X_{i-n}$  with the lower  $r$  bits of  $X_{i+1-n}$  to obtain an unsigned integer value  $Y$ .
- b) With  $\alpha = a \cdot (Y \text{ bitand } 1)$ , set  $X_i$  to  $X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha$ .

The sequence  $X$  is initialized with the help of an initialization multiplier  $f$ .

<sup>3</sup> The generation algorithm determines the unsigned integer values  $z_1, z_2, z_3, z_4$  as follows, then delivers  $z_4$  as its result:

- a) Let  $z_1 = X_i \text{ xor } ((X_i \text{ rshift } u) \text{ bitand } d)$ .
- b) Let  $z_2 = z_1 \text{ xor } ((z_1 \text{ lshift}_w s) \text{ bitand } b)$ .
- c) Let  $z_3 = z_2 \text{ xor } ((z_2 \text{ lshift}_w t) \text{ bitand } c)$ .
- d) Let  $z_4 = z_3 \text{ xor } (z_3 \text{ rshift } \ell)$ .

```
template<class UIntType, size_t w, size_t n, size_t m, size_t r,
        UIntType a, size_t u, UIntType d, size_t s,
        UIntType b, size_t t,
```

<sup>276</sup>) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```

        UIntType c, size_t l, UIntType f>
class mersenne_twister_engine
{
public:
    // types
    typedef UIntType result_type;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;
    static constexpr size_t shift_size = m;
    static constexpr size_t mask_bits = r;
    static constexpr UIntType xor_mask = a;
    static constexpr size_t tempering_u = u;
    static constexpr UIntType tempering_d = d;
    static constexpr size_t tempering_s = s;
    static constexpr UIntType tempering_b = b;
    static constexpr size_t tempering_t = t;
    static constexpr UIntType tempering_c = c;
    static constexpr size_t tempering_l = l;
    static constexpr UIntType initialization_multiplier = f;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2w - 1; }
    static constexpr result_type default_seed = 5489u;

    // constructors and seeding functions
    explicit mersenne_twister_engine(result_type value = default_seed);
    template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
};

```

- 4 The following relations shall hold:  $0 < m, m \leq n, 2u < w, r \leq w, u \leq w, s \leq w, t \leq w, l \leq w, w \leq \text{numeric\_limits}<\text{UIntType}>::\text{digits}$ ,  $a \leq (1u \ll w) - 1u$ ,  $b \leq (1u \ll w) - 1u$ ,  $c \leq (1u \ll w) - 1u$ ,  $d \leq (1u \ll w) - 1u$ , and  $f \leq (1u \ll w) - 1u$ .

- 5 The textual representation of  $x_i$  consists of the values of  $X_{i-n}, \dots, X_{i-1}$ , in that order.

```
explicit mersenne_twister_engine(result_type value = default_seed);
```

- 6 *Effects:* Constructs a `mersenne_twister_engine` object. Sets  $X_{-n}$  to `value` mod  $2^w$ . Then, iteratively for  $i = 1-n, \dots, -1$ , sets  $X_i$  to

$$\left[ f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w-2))) + i \bmod n \right] \bmod 2^w.$$

- 7 *Complexity:*  $\mathcal{O}(n)$ .

```
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
```

- 8 *Effects:* Constructs a `mersenne_twister_engine` object. With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $n \cdot k$ , invokes `q.generate(a+0, a+n \cdot k)` and then, iteratively for  $i = -n, \dots, -1$ , sets  $X_i$  to  $\left( \sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j} \right) \bmod 2^w$ . Finally, if the most significant  $w-r$  bits of  $X_{-n}$  are zero, and if each of the other resulting  $X_i$  is 0, changes  $X_{-n}$  to  $2^{w-1}$ .

**26.6.3.3 Class template `subtract_with_carry_engine`****[rand.eng.sub]**

- <sup>1</sup> A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.
- <sup>2</sup> The state  $\mathbf{x}_i$  of a `subtract_with_carry_engine` object  $\mathbf{x}$  is of size  $\mathcal{O}(r)$ , and consists of a sequence  $X$  of  $r$  integer values  $0 \leq X_i < m = 2^w$ ; all subscripts applied to  $X$  are to be taken modulo  $r$ . The state  $\mathbf{x}_i$  additionally consists of an integer  $c$  (known as the *carry*) whose value is either 0 or 1.
- <sup>3</sup> The state transition is performed as follows:

a) Let  $Y = X_{i-s} - X_{i-r} - c$ .

b) Set  $X_i$  to  $y = Y \bmod m$ . Set  $c$  to 1 if  $Y < 0$ , otherwise set  $c$  to 0.

[*Note:* This algorithm corresponds to a modular linear function of the form  $\text{TA}(\mathbf{x}_i) = (a \cdot \mathbf{x}_i) \bmod b$ , where  $b$  is of the form  $m^r - m^s + 1$  and  $a = b - (b - 1)/m$ . — *end note*]

- <sup>4</sup> The generation algorithm is given by  $\text{GA}(\mathbf{x}_i) = y$ , where  $y$  is the value produced as a result of advancing the engine's state as described above.

```
template<class UIntType, size_t w, size_t s, size_t r>
class subtract_with_carry_engine
{
public:
    // types
    typedef UIntType result_type;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t short_lag = s;
    static constexpr size_t long_lag = r;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m - 1; }
    static constexpr result_type default_seed = 19780503u;

    // constructors and seeding functions
    explicit subtract_with_carry_engine(result_type value = default_seed);
    template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
};
```

- <sup>5</sup> The following relations shall hold:  $0u < s$ ,  $s < r$ ,  $0 < w$ , and  $w \leq \text{numeric\_limits}<\text{UIntType}>::\text{digits}$ .
- <sup>6</sup> The textual representation consists of the values of  $X_{i-r}, \dots, X_{i-1}$ , in that order, followed by  $c$ .

```
explicit subtract_with_carry_engine(result_type value = default_seed);
```

- <sup>7</sup> *Effects:* Constructs a `subtract_with_carry_engine` object. Sets the values of  $X_{-r}, \dots, X_{-1}$ , in that order, as specified below. If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

To set the values  $X_k$ , first construct  $\mathbf{e}$ , a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
    40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each  $X_k$ , obtain new values  $z_0, \dots, z_{n-1}$  from  $n = \lceil w/32 \rceil$  successive invocations of  $\mathbf{e}$  taken modulo  $2^{32}$ . Set  $X_k$  to  $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j}\right) \bmod m$ .

8 *Complexity:* Exactly  $n \cdot r$  invocations of  $\mathbf{e}$ .

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

9 *Effects:* Constructs a `subtract_with_carry_engine` object. With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $r \cdot k$ , invokes `q.generate(a+0, a+r·k)` and then, iteratively for  $i = -r, \dots, -1$ , sets  $X_i$  to  $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right) \bmod m$ . If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

## 26.6.4 Random number engine adaptor class templates [rand.adapt]

### 26.6.4.1 In general [rand.adapt.general]

- 1 Each type instantiated from a class template specified in this section 26.6.4 satisfies the requirements of a random number engine adaptor (26.6.1.5) type.
- 2 Except where specified otherwise, the complexity of each function specified in this section 26.6.4 is constant.
- 3 Except where specified otherwise, no function described in this section 26.6.4 throws an exception.
- 4 Descriptions are provided in this section 26.6.4 only for adaptor operations that are not described in section 26.6.1.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 5 Each template specified in this section 26.6.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

#### 26.6.4.2 Class template `discard_block_engine` [rand.adapt.disc]

- 1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine  $e$ . The state  $\mathbf{x}_i$  of a `discard_block_engine` engine adaptor object  $\mathbf{x}$  consists of the state  $\mathbf{e}_i$  of its base engine  $\mathbf{e}$  and an additional integer  $n$ . The size of the state is the size of  $e$ 's state plus 1.
- 2 The transition algorithm discards all but  $r > 0$  values from each block of  $p \geq r$  values delivered by  $e$ . The state transition is performed as follows: If  $n \geq r$ , advance the state of  $\mathbf{e}$  from  $\mathbf{e}_i$  to  $\mathbf{e}_{i+p-r}$  and set  $n$  to 0. In any case, then increment  $n$  and advance  $\mathbf{e}$ 's then-current state  $\mathbf{e}_j$  to  $\mathbf{e}_{j+1}$ .
- 3 The generation algorithm yields the value returned by the last invocation of  $\mathbf{e}()$  while advancing  $\mathbf{e}$ 's state as described above.

```
template<class Engine, size_t p, size_t r>
class discard_block_engine
{
public:
    // types
    typedef typename Engine::result_type result_type;

    // engine characteristics
    static constexpr size_t block_size = p;
    static constexpr size_t used_block = r;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    discard_block_engine();
```

```

explicit discard_block_engine(const Engine& e);
explicit discard_block_engine(Engine&& e);
explicit discard_block_engine(result_type s);
template<class Sseq> explicit discard_block_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; };

private:
    Engine e;    // exposition only
    int n;       // exposition only
};

```

- 4 The following relations shall hold:  $0 < r$  and  $r \leq p$ .
- 5 The textual representation consists of the textual representation of **e** followed by the value of **n**.
- 6 In addition to its behavior pursuant to section 26.6.1.5, each constructor that is not a copy constructor sets **n** to 0.

#### 26.6.4.3 Class template independent\_bits\_engine [rand.adapt.ibits]

- 1 An **independent\_bits\_engine** random number engine adaptor combines random numbers that are produced by some base engine *e*, so as to produce random numbers with a specified number of bits *w*. The state  $x_i$  of an **independent\_bits\_engine** engine adaptor object **x** consists of the state  $e_i$  of its base engine **e**; the size of the state is the size of *e*'s state.
- 2 The transition and generation algorithms are described in terms of the following integral constants:

- a) Let  $R = e.max() - e.min() + 1$  and  $m = \lfloor \log_2 R \rfloor$ .
- b) With *n* as determined below, let  $w_0 = \lfloor w/n \rfloor$ ,  $n_0 = n - w \bmod n$ ,  $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$ , and  $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$ .
- c) Let  $n = \lceil w/m \rceil$  if and only if the relation  $R - y_0 \leq \lfloor y_0/n \rfloor$  holds as a result. Otherwise let  $n = 1 + \lceil w/m \rceil$ .

[Note: The relation  $w = n_0 w_0 + (n - n_0)(w_0 + 1)$  always holds. — end note]

- 3 The transition algorithm is carried out by invoking **e()** as often as needed to obtain  $n_0$  values less than  $y_0 + e.min()$  and  $n - n_0$  values less than  $y_1 + e.min()$ .
- 4 The generation algorithm uses the values produced while advancing the state as described above to yield a quantity *S* obtained as if by the following algorithm:

```

S = 0;
for (k = 0; k ≠ n0; k += 1) {
    do u = e() - e.min(); while (u ≥ y0);
    S = 2w0 · S + u mod 2w0;
}
for (k = n0; k ≠ n; k += 1) {
    do u = e() - e.min(); while (u ≥ y1);

```

```

     $S = 2^{w_0+1} \cdot S + u \bmod 2^{w_0+1};$ 
}

template<class Engine, size_t w, class UIntType>
class independent_bits_engine
{
public:
    // types
    typedef UIntType result_type;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return  $2^w - 1$ ; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

private:
    Engine e;    // exposition only
};

```

5 The following relations shall hold:  $0 < w$  and  $w \leq \text{numeric\_limits}<\text{result\_type}>::\text{digits}$ .

6 The textual representation consists of the textual representation of **e**.

#### 26.6.4.4 Class template `shuffle_order_engine`

[rand.adapt.shuf]

1 A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine *e*, but delivers them in a different sequence. The state  $x_i$  of a `shuffle_order_engine` engine adaptor object *x* consists of the state  $e_i$  of its base engine **e**, an additional value *Y* of the type delivered by **e**, and an additional sequence *V* of *k* values also of the type delivered by **e**. The size of the state is the size of *e*'s state plus *k* + 1.

2 The transition algorithm permutes the values produced by *e*. The state transition is performed as follows:

- a) Calculate an integer  $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$ .
- b) Set *Y* to *V<sub>j</sub>* and then set *V<sub>j</sub>* to **e**().

3 The generation algorithm yields the last value of *Y* produced while advancing **e**'s state as described above.

```
template<class Engine, size_t k>
```

```

class shuffle_order_engine
{
public:
    // types
    typedef typename Engine::result_type result_type;

    // engine characteristics
    static constexpr size_t table_size = k;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    shuffle_order_engine();
    explicit shuffle_order_engine(const Engine& e);
    explicit shuffle_order_engine(Engine&& e);
    explicit shuffle_order_engine(result_type s);
    template<class Sseq> explicit shuffle_order_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; };

private:
    Engine e;           // exposition only
    result_type Y;       // exposition only
    result_type V[k];    // exposition only
};

```

- 4 The following relation shall hold:  $0 < k$ .
- 5 The textual representation consists of the textual representation of  $e$ , followed by the  $k$  values of  $V$ , followed by the value of  $Y$ .
- 6 In addition to its behavior pursuant to section 26.6.1.5, each constructor that is not a copy constructor initializes  $V[0], \dots, V[k-1]$  and  $Y$ , in that order, with values returned by successive invocations of  $e()$ .

### 26.6.5 Engines and engine adaptors with predefined parameters [rand.predef]

```

typedef linear_congruential_engine<uint_fast32_t, 16807, 0, 2147483647>
    minstd_rand0;

```

- 1 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `minstd_rand0` shall produce the value 1043618065.

```

typedef linear_congruential_engine<uint_fast32_t, 48271, 0, 2147483647>
    minstd_rand;

```

- 2 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `minstd_rand` shall produce the value 399268537.

```

typedef mersenne_twister_engine<uint_fast32_t,

```

```
32,624,397,31,0x9908b0df,11,0xffffffff,7,0x9d2c5680,15,0xefc60000,18,1812433253>
mt19937;
```

- 3 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937` shall produce the value 4123659995.

```
typedef mersenne_twister_engine<uint_fast64_t,
    64,312,156,31,0xb5026f5aa96619e9,29,
    0x5555555555555555,17,
    0x71d67ffeda60000,37,
    0xfff7eee000000000,43,
    6364136223846793005>
mt19937_64;
```

- 4 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937_64` shall produce the value 9981545732273789042.

```
typedef subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>
ranlux24_base;
```

- 5 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24_base` shall produce the value 7937952.

```
typedef subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>
ranlux48_base;
```

- 6 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48_base` shall produce the value 61839128582725.

```
typedef discard_block_engine<ranlux24_base, 223, 23>
ranlux24;
```

- 7 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24` shall produce the value 9901578.

```
typedef discard_block_engine<ranlux48_base, 389, 11>
ranlux48;
```

- 8 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48` shall produce the value 249142670248501.

```
typedef shuffle_order_engine<minstd_rand0,256>
knuth_b;
```

- 9 *Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `knuth_b` shall produce the value 1112339016.

```
typedef implementation-defined
default_random_engine;
```

- 10 *Remark:* The choice of engine type named by this `typedef` is implementation-defined. [Note: The implementation may select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations may select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations. — end note]

**26.6.6 Class random\_device****[rand.device]**

- <sup>1</sup> A **random\_device** uniform random number generator produces non-deterministic random numbers.
- <sup>2</sup> If implementation limitations prevent generating non-deterministic random numbers, the implementation may employ a random number engine.

```
class random_device
{
public:
    // types
    typedef unsigned int result_type;

    // generator characteristics
    static constexpr result_type min() { return numeric_limits<result_type>::min(); }
    static constexpr result_type max() { return numeric_limits<result_type>::max(); }

    // constructors
    explicit random_device(const string& token = implementation-defined);

    // generating functions
    result_type operator()();

    // property functions
    double entropy() const noexcept;

    // no copy functions
    random_device(const random_device& ) = delete;
    void operator=(const random_device& ) = delete;
};
```

```
explicit random_device(const string& token = implementation-defined);
```

- <sup>3</sup> *Effects:* Constructs a **random\_device** non-deterministic uniform random number generator object. The semantics and default value of the **token** parameter are implementation-defined. <sup>277</sup>
- <sup>4</sup> *Throws:* A value of an implementation-defined type derived from **exception** if the **random\_device** could not be initialized.

```
double entropy() const noexcept;
```

- <sup>5</sup> *Returns:* If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate<sup>278</sup> for the random numbers returned by **operator()**, in the range **min()** to **log<sub>2</sub>(max() + 1)**.

```
result_type operator()();
```

- <sup>6</sup> *Returns:* A non-deterministic random value, uniformly distributed between **min()** and **max()**, inclusive. It is implementation-defined how these values are generated.
- <sup>7</sup> *Throws:* A value of an implementation-defined type derived from **exception** if a random number could not be obtained.

<sup>277</sup>) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

<sup>278</sup>) If a device has  $n$  states whose respective probabilities are  $P_0, \dots, P_{n-1}$ , the device entropy  $S$  is defined as  $S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i$ .

## 26.6.7 Utilities

[rand.util]

### 26.6.7.1 Class seed\_seq

[rand.util.seedseq]

```

class seed_seq
{
public:
    // types
    typedef uint_least32_t result_type;

    // constructors
    seed_seq();
    template<class T>
        seed_seq(initializer_list<T> il);
    template<class InputIterator>
        seed_seq(InputIterator begin, InputIterator end);

    // generating functions
    template<class RandomAccessIterator>
        void generate(RandomAccessIterator begin, RandomAccessIterator end);

    // property functions
    size_t size() const noexcept;
    template<class OutputIterator>
        void param(OutputIterator dest) const;

    // no copy functions
    seed_seq(const seed_seq& ) = delete;
    void operator=(const seed_seq& ) = delete;

private:
    vector<result_type> v;    // exposition only
};

```

seed\_seq();

1       *Effects:* Constructs a seed\_seq object as if by default-constructing its member v.

2       *Throws:* Nothing.

```

template<class T>
    seed_seq(initializer_list<T> il);

```

3       *Requires:* T shall be an integer type.

4       *Effects:* Same as seed\_seq(il.begin(), il.end()).

```

template<class InputIterator>
    seed_seq(InputIterator begin, InputIterator end);

```

5       *Requires:* InputIterator shall satisfy the requirements of an input iterator (Table 114) type. Moreover, iterator\_traits<InputIterator>::value\_type shall denote an integer type.

6       *Effects:* Constructs a seed\_seq object by the following algorithm:

```

    for( InputIterator s = begin; s != end; ++s)
        v.push_back((*s) mod 232);

```

```

template<class RandomAccessIterator>
    void generate(RandomAccessIterator begin, RandomAccessIterator end);

```

7 *Requires:* `RandomAccessIterator` shall meet the requirements of a mutable random access iterator (Table 118) type. Moreover, `iterator_traits<RandomAccessIterator>::value_type` shall denote an unsigned integer type capable of accommodating 32-bit quantities.

8 *Effects:* Does nothing if `begin == end`. Otherwise, with  $s = v.size()$  and  $n = end - begin$ , fills the supplied range `[begin, end)` according to the following algorithm in which each operation is to be carried out modulo  $2^{32}$ , each indexing operator applied to `begin` is to be taken modulo  $n$ , and  $T(x)$  is defined as  $x \text{ xor } (x \text{ rshift } 27)$ :

- a) By way of initialization, set each element of the range to the value `0x8b8b8b8b`. Additionally, for use in subsequent steps, let  $p = (n - t)/2$  and let  $q = p + t$ , where

$$t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n - 1)/2;$$

- b) With  $m$  as the larger of  $s + 1$  and  $n$ , transform the elements of the range: iteratively for  $k = 0, \dots, m - 1$ , calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\text{begin}[k] \text{ xor } \text{begin}[k + p] \text{ xor } \text{begin}[k - 1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + v[k - 1] & , 0 < k \leq s \\ k \bmod n & , s < k \end{cases} \end{aligned}$$

and, in order, increment `begin[k + p]` by  $r_1$ , increment `begin[k + q]` by  $r_2$ , and set `begin[k]` to  $r_2$ .

- c) Transform the elements of the range again, beginning where the previous step ended: iteratively for  $k = m, \dots, m + n - 1$ , calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\text{begin}[k] + \text{begin}[k + p] + \text{begin}[k - 1]) \\ r_4 &= r_3 - (k \bmod n) \end{aligned}$$

and, in order, update `begin[k + p]` by xoring it with  $r_3$ , update `begin[k + q]` by xoring it with  $r_4$ , and set `begin[k]` to  $r_4$ .

9 *Throws:* What and when `RandomAccessIterator` operations of `begin` and `end` throw.

```
size_t size() const noexcept;
```

10 *Returns:* The number of 32-bit units that would be returned by a call to `param()`.

11 *Complexity:* Constant time.

```
template<class OutputIterator>
void param(OutputIterator dest) const;
```

12 *Requires:* `OutputIterator` shall satisfy the requirements of an output iterator (Table 115) type. Moreover, the expression `*dest = rt` shall be valid for a value `rt` of type `result_type`.

13 *Effects:* Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

14 *Throws:* What and when `OutputIterator` operations of `dest` throw.

**26.6.7.2 Function template `generate_canonical`****[rand.util.canonical]**

- <sup>1</sup> Each function instantiated from the template described in this section 26.6.7.2 maps the result of one or more invocations of a supplied uniform random number generator `g` to one member of the specified `RealType` such that, if the values  $g_i$  produced by `g` are uniformly distributed, the instantiation's results  $t_j$ ,  $0 \leq t_j < 1$ , are distributed as uniformly as possible as specified below.
- <sup>2</sup> [*Note:* Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random number generator into a value that can be delivered by a random number distribution. — *end note*]

```
template<class RealType, size_t bits, class URNG>
RealType generate_canonical(URNG& g);
```

- <sup>3</sup> *Complexity:* Exactly  $k = \max(1, \lceil b/\log_2 R \rceil)$  invocations of `g`, where  $b^{279}$  is the lesser of `numeric_limits<RealType>::digits` and `bits`, and  $R$  is the value of `g.max() - g.min() + 1`.
- <sup>4</sup> *Effects:* Invokes `g()`  $k$  times to obtain values  $g_0, \dots, g_{k-1}$ , respectively. Calculates a quantity

$$S = \sum_{i=0}^{k-1} (g_i - g.\text{min}()) \cdot R^i$$

using arithmetic of type `RealType`.

- <sup>5</sup> *Returns:*  $S/R^k$ .
- <sup>6</sup> *Throws:* What and when `g` throws.

**26.6.8 Random number distribution class templates****[rand.dist]****26.6.8.1 In general****[rand.dist.general]**

- <sup>1</sup> Each type instantiated from a class template specified in this section 26.6.8 satisfies the requirements of a random number distribution (26.6.1.6) type.
- <sup>2</sup> Descriptions are provided in this section 26.6.8 only for distribution operations that are not described in 26.6.1.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- <sup>3</sup> The algorithms for producing each of the specified distributions are implementation-defined.
- <sup>4</sup> The value of each probability density function  $p(z)$  and of each discrete probability function  $P(z_i)$  specified in this section is 0 everywhere outside its stated domain.

**26.6.8.2 Uniform distributions****[rand.dist.uni]****26.6.8.2.1 Class template `uniform_int_distribution`****[rand.dist.uni.int]**

- <sup>1</sup> A `uniform_int_distribution` random number distribution produces random integers  $i$ ,  $a \leq i \leq b$ , distributed according to the constant discrete probability function

$$P(i | a, b) = 1/(b - a + 1) .$$

```
template<class IntType = int>
class uniform_int_distribution
{
public:
    // types
```

---

279)  $b$  is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

```

typedef IntType result_type;
typedef unspecified param_type;

// constructors and reset functions
explicit uniform_int_distribution(IntType a = 0, IntType b = numeric_limits<IntType>::max());
explicit uniform_int_distribution(const param_type& parm);
void reset();

// generating functions
template<class URNG>
    result_type operator()(URNG& g);
template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
explicit uniform_int_distribution(IntType a = 0, IntType b = numeric_limits<IntType>::max());
```

2     *Requires:*  $a \leq b$ .

3     *Effects:* Constructs a `uniform_int_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4     *Returns:* The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5     *Returns:* The value of the `b` parameter with which the object was constructed.

#### 26.6.8.2.2 Class template `uniform_real_distribution` [rand.dist.uni.real]

1 A `uniform_real_distribution` random number distribution produces random numbers  $x$ ,  $a \leq x < b$ , distributed according to the constant probability density function

$$p(x | a, b) = 1/(b - a) .$$

[ *Note:* This implies that  $p(x | a, b)$  is undefined when  $a == b$ . — end note ]

```

template<class RealType = double>
class uniform_real_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit uniform_real_distribution(RealType a = 0.0, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);

```

```

void reset();

// generating functions
template<class URNG>
    result_type operator()(URNG& g);
template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
explicit uniform_real_distribution(RealType a = 0.0, RealType b = 1.0);
```

2     *Requires:*  $a \leq b$  and  $b - a \leq \text{numeric\_limits}<\text{RealType}>::\text{max}()$ .

3     *Effects:* Constructs a `uniform_real_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4     *Returns:* The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5     *Returns:* The value of the `b` parameter with which the object was constructed.

### 26.6.8.3 Bernoulli distributions

[rand.dist.bern]

#### 26.6.8.3.1 Class `bernoulli_distribution`

[rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values  $b$  distributed according to the discrete probability function

$$P(b|p) = \begin{cases} p & \text{if } b = \text{true} \\ 1 - p & \text{if } b = \text{false} \end{cases}.$$

```

class bernoulli_distribution
{
public:
    // types
    typedef bool result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit bernoulli_distribution(double p = 0.5);
    explicit bernoulli_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);

```

```

template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
explicit bernoulli_distribution(double p = 0.5);
```

2     *Requires:*  $0 \leq p \leq 1$ .

3     *Effects:* Constructs a `bernoulli_distribution` object; `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4     *Returns:* The value of the `p` parameter with which the object was constructed.

#### 26.6.8.3.2 Class template `binomial_distribution` [rand.dist.bern.bin]

1 A `binomial_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i|t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i}.$$

```

template<class IntType = int>
    class binomial_distribution
    {
    public:
        // types
        typedef IntType result_type;
        typedef unspecified param_type;

        // constructors and reset functions
        explicit binomial_distribution(IntType t = 1, double p = 0.5);
        explicit binomial_distribution(const param_type& parm);
        void reset();

        // generating functions
        template<class URNG>
            result_type operator()(URNG& g);
        template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

        // property functions
        IntType t() const;
        double p() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };

```

```
explicit binomial_distribution(IntType t = 1, double p = 0.5);
```

2     *Requires:*  $0 \leq p \leq 1$  and  $0 \leq t$ .

3     *Effects:* Constructs a `binomial_distribution` object; `t` and `p` correspond to the respective parameters of the distribution.

```
IntType t() const;
```

4     *Returns:* The value of the `t` parameter with which the object was constructed.

```
double p() const;
```

5     *Returns:* The value of the `p` parameter with which the object was constructed.

### 26.6.8.3.3 Class template `geometric_distribution` [rand.dist.bern.geo]

1 A `geometric_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i|p) = p \cdot (1 - p)^i.$$

```
template<class IntType = int>
class geometric_distribution
{
public:
    // types
    typedef IntType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit geometric_distribution(double p = 0.5);
    explicit geometric_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit geometric_distribution(double p = 0.5);
```

2     *Requires:*  $0 < p < 1$ .

3     *Effects:* Constructs a `geometric_distribution` object; `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4     *Returns:* The value of the `p` parameter with which the object was constructed.

#### 26.6.8.3.4 Class template `negative_binomial_distribution` [rand.dist.bern.negbin]

- <sup>1</sup> A `negative_binomial_distribution` random number distribution produces random integers  $i \geq 0$  distributed according to the discrete probability function

$$P(i|k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i.$$

[*Note:* This implies that  $P(i|k, p)$  is undefined when  $p == 1$ . — *end note*]

```
template<class IntType = int>
class negative_binomial_distribution
{
public:
    // types
    typedef IntType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit negative_binomial_distribution(IntType k = 1, double p = 0.5);
    explicit negative_binomial_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    IntType k() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit negative_binomial_distribution(IntType k = 1, double p = 0.5);
```

- <sup>2</sup> *Requires:*  $0 < p \leq 1$  and  $0 < k$ .
- <sup>3</sup> *Effects:* Constructs a `negative_binomial_distribution` object; `k` and `p` correspond to the respective parameters of the distribution.

```
IntType k() const;
```

- <sup>4</sup> *Returns:* The value of the `k` parameter with which the object was constructed.

```
double p() const;
```

- <sup>5</sup> *Returns:* The value of the `p` parameter with which the object was constructed.

#### 26.6.8.4 Poisson distributions [rand.dist.pois]

##### 26.6.8.4.1 Class template `poisson_distribution` [rand.dist.pois.poisson]

- <sup>1</sup> A `poisson_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function

$$P(i|\mu) = \frac{e^{-\mu} \mu^i}{i!}.$$

The distribution parameter  $\mu$  is also known as this distribution's *mean* .

```
template<class IntType = int>
class poisson_distribution
{
public:
    // types
    typedef IntType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit poisson_distribution(double mean = 1.0);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit poisson_distribution(double mean = 1.0);
```

2       *Requires:*  $0 < \text{mean}$ .

3       *Effects:* Constructs a `poisson_distribution` object; `mean` corresponds to the parameter of the distribution.

```
double mean() const;
```

4       *Returns:* The value of the `mean` parameter with which the object was constructed.

#### 26.6.8.4.2 Class template `exponential_distribution` [rand.dist.pois.exp]

1 An `exponential_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \lambda) = \lambda e^{-\lambda x} .$$

```
template<class RealType = double>
class exponential_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit exponential_distribution(RealType lambda = 1.0);
```

```
explicit exponential_distribution(const param_type& parm);
void reset();
```

```
// generating functions
```

```
template<class URNG>
```

```
    result_type operator()(URNG& g);
```

```
template<class URNG>
```

```
    result_type operator()(URNG& g, const param_type& parm);
```

```
// property functions
```

```
RealType lambda() const;
```

```
param_type param() const;
```

```
void param(const param_type& parm);
```

```
result_type min() const;
```

```
result_type max() const;
```

```
};
```

```
explicit exponential_distribution(RealType lambda = 1.0);
```

2     *Requires:*  $0 < \text{lambda}$ .

3     *Effects:* Constructs a `exponential_distribution` object; `lambda` corresponds to the parameter of the distribution.

```
RealType lambda() const;
```

4     *Returns:* The value of the `lambda` parameter with which the object was constructed.

#### 26.6.8.4.3 Class template `gamma_distribution`

[`rand.dist.pois.gamma`]

1 A `gamma_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$

```
template<class RealType = double>
```

```
    class gamma_distribution
```

```
    {
```

```
    public:
```

```
        // types
```

```
        typedef RealType result_type;
```

```
        typedef unspecified param_type;
```

```
        // constructors and reset functions
```

```
        explicit gamma_distribution(RealType alpha = 1.0, RealType beta = 1.0);
```

```
        explicit gamma_distribution(const param_type& parm);
```

```
        void reset();
```

```
        // generating functions
```

```
        template<class URNG>
```

```
            result_type operator()(URNG& g);
```

```
        template<class URNG>
```

```
            result_type operator()(URNG& g, const param_type& parm);
```

```
        // property functions
```

```

RealType alpha() const;
RealType beta() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
explicit gamma_distribution(RealType alpha = 1.0, RealType beta = 1.0);
```

2     *Requires:*  $0 < \alpha$  and  $0 < \beta$ .

3     *Effects:* Constructs a `gamma_distribution` object; `alpha` and `beta` correspond to the parameters of the distribution.

```
RealType alpha() const;
```

4     *Returns:* The value of the `alpha` parameter with which the object was constructed.

```
RealType beta() const;
```

5     *Returns:* The value of the `beta` parameter with which the object was constructed.

#### 26.6.8.4.4 Class template `weibull_distribution`

[`rand.dist.pois.weibull`]

1 A `weibull_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x|a,b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).$$

```

template<class RealType = double>
class weibull_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit weibull_distribution(RealType a = 1.0, RealType b = 1.0);
    explicit weibull_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

```

```
explicit weibull_distribution(RealType a = 1.0, RealType b = 1.0);
```

2     *Requires:*  $0 < a$  and  $0 < b$ .

3     *Effects:* Constructs a `weibull_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4     *Returns:* The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5     *Returns:* The value of the `b` parameter with which the object was constructed.

#### 26.6.8.4.5 Class template `extreme_value_distribution` [rand.dist.pois.extreme]

1 An `extreme_value_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function<sup>280</sup>

$$p(x|a,b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right).$$

```
template<class RealType = double>
class extreme_value_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit extreme_value_distribution(RealType a = 0.0, RealType b = 1.0);
    explicit extreme_value_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit extreme_value_distribution(RealType a = 0.0, RealType b = 1.0);
```

---

280) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

- 2 *Requires:*  $0 < b$ .
- 3 *Effects:* Constructs an `extreme_value_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

`RealType a() const;`

- 4 *Returns:* The value of the `a` parameter with which the object was constructed.

`RealType b() const;`

- 5 *Returns:* The value of the `b` parameter with which the object was constructed.

## 26.6.8.5 Normal distributions [rand.dist.norm]

### 26.6.8.5.1 Class template `normal_distribution` [rand.dist.norm.normal]

- 1 A `normal_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x | \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).$$

The distribution parameters  $\mu$  and  $\sigma$  are also known as this distribution's *mean* and *standard deviation*.

```
template<class RealType = double>
class normal_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit normal_distribution(RealType mean = 0.0, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit normal_distribution(RealType mean = 0.0, RealType stddev = 1.0);
```

- 2 *Requires:*  $0 < stddev$ .
- 3 *Effects:* Constructs a `normal_distribution` object; `mean` and `stddev` correspond to the respective parameters of the distribution.

RealType mean() const;

4       *Returns:* The value of the `mean` parameter with which the object was constructed.

RealType stddev() const;

5       *Returns:* The value of the `stddev` parameter with which the object was constructed.

#### 26.6.8.5.2 Class template `lognormal_distribution` [rand.dist.norm.lognormal]

1 A `lognormal_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x|m,s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).$$

```
template<class RealType = double>
class lognormal_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit lognormal_distribution(RealType m = 0.0, RealType s = 1.0);
    explicit lognormal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType s() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit lognormal_distribution(RealType m = 0.0, RealType s = 1.0);
```

2       *Requires:*  $0 < s$ .

3       *Effects:* Constructs a `lognormal_distribution` object; `m` and `s` correspond to the respective parameters of the distribution.

RealType m() const;

4       *Returns:* The value of the `m` parameter with which the object was constructed.

RealType s() const;

5       *Returns:* The value of the `s` parameter with which the object was constructed.

**26.6.8.5.3 Class template chi\_squared\_distribution****[rand.dist.norm.chisq]**

- <sup>1</sup> A `chi_squared_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function

$$p(x|n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.$$

```
template<class RealType = double>
class chi_squared_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit chi_squared_distribution(RealType n = 1);
    explicit chi_squared_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
explicit chi_squared_distribution(RealType n = 1);
```

- <sup>2</sup> *Requires:*  $0 < n$ .
- <sup>3</sup> *Effects:* Constructs a `chi_squared_distribution` object; `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

- <sup>4</sup> *Returns:* The value of the `n` parameter with which the object was constructed.

**26.6.8.5.4 Class template cauchy\_distribution****[rand.dist.norm.cauchy]**

- <sup>1</sup> A `cauchy_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x|a,b) = \left( \pi b \left( 1 + \left( \frac{x-a}{b} \right)^2 \right) \right)^{-1}.$$

```

template<class RealType = double>
class cauchy_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit cauchy_distribution(RealType a = 0.0, RealType b = 1.0);
    explicit cauchy_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

```

```
explicit cauchy_distribution(RealType a = 0.0, RealType b = 1.0);
```

2       *Requires:*  $0 < b$ .

3       *Effects:* Constructs a `cauchy_distribution` object; `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4       *Returns:* The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5       *Returns:* The value of the `b` parameter with which the object was constructed.

#### 26.6.8.5.5 Class template `fisher_f_distribution` [rand.dist.norm.f]

<sup>1</sup> A `fisher_f_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function

$$p(x | m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}.$$

```

template<class RealType = double>
class fisher_f_distribution
{
public:
    // types
    typedef RealType result_type;

```

```

typedef unspecified param_type;

// constructor and reset functions
explicit fisher_f_distribution(RealType m = 1, RealType n = 1);
explicit fisher_f_distribution(const param_type& parm);
void reset();

// generating functions
template<class URNG>
    result_type operator()(URNG& g);
template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

// property functions
RealType m() const;
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
explicit fisher_f_distribution(RealType m = 1, RealType n = 1);
```

2     *Requires:*  $0 < m$  and  $0 < n$ .

3     *Effects:* Constructs a `fisher_f_distribution` object; `m` and `n` correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4     *Returns:* The value of the `m` parameter with which the object was constructed.

```
RealType n() const;
```

5     *Returns:* The value of the `n` parameter with which the object was constructed.

#### 26.6.8.5.6 Class template `student_t_distribution`

[rand.dist.norm.t]

1 A `student_t_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function

$$p(x|n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.$$

```

template<class RealType = double>
    class student_t_distribution
    {
    public:
        // types
        typedef RealType result_type;
        typedef unspecified param_type;

        // constructor and reset functions
        explicit student_t_distribution(RealType n = 1);
        explicit student_t_distribution(const param_type& parm);
        void reset();
    };

```

```

// generating functions
template<class URNG>
    result_type operator()(URNG& g);
template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

```

```

// property functions
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
explicit student_t_distribution(RealType n = 1);
```

<sup>2</sup> *Requires:*  $0 < n$ .

<sup>3</sup> *Effects:* Constructs a `student_t_distribution` object; `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

<sup>4</sup> *Returns:* The value of the `n` parameter with which the object was constructed.

#### 26.6.8.6 Sampling distributions [rand.dist.samp]

##### 26.6.8.6.1 Class template `discrete_distribution` [rand.dist.samp.discrete]

<sup>1</sup> A `discrete_distribution` random number distribution produces random integers  $i$ ,  $0 \leq i < n$ , distributed according to the discrete probability function

$$P(i | p_0, \dots, p_{n-1}) = p_i .$$

<sup>2</sup> Unless specified otherwise, the distribution parameters are calculated as:  $p_k = w_k / S$  for  $k = 0, \dots, n-1$ , in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```

template<class IntType = int>
    class discrete_distribution
    {
    public:
        // types
        typedef IntType result_type;
        typedef unspecified param_type;

        // constructor and reset functions
        discrete_distribution();
        template<class InputIterator>
            discrete_distribution(InputIterator firstW, InputIterator lastW);
        discrete_distribution(initializer_list<double> wl);
        template<class UnaryOperation>
            discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
        explicit discrete_distribution(const param_type& parm);
        void reset();
    };

```

```

// generating functions
template<class URNG>
    result_type operator()(URNG& g);
template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

// property functions
vector<double> probabilities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

```

```
discrete_distribution();
```

- 3 *Effects:* Constructs a `discrete_distribution` object with  $n = 1$  and  $p_0 = 1$ . [ *Note:* Such an object will always deliver the value 0. — *end note* ]

```

template<class InputIterator>
    discrete_distribution(InputIterator firstW, InputIterator lastW);

```

- 4 *Requires:* `InputIterator` shall satisfy the requirements of an input iterator (Table 114) type. Moreover, `iterator_traits<InputIterator>::value_type` shall denote a type that is convertible to `double`. If `firstW == lastW`, let  $n = 1$  and  $w_0 = 1$ . Otherwise,  $[firstW, lastW)$  shall form a sequence  $w$  of length  $n > 0$ .

- 5 *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above.

```
discrete_distribution(initializer_list<double> wl);
```

- 6 *Effects:* Same as `discrete_distribution(wl.begin(), wl.end())`.

```

template<class UnaryOperation>
    discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

```

- 7 *Requires:* Each instance of type `UnaryOperation` shall be a function object (20.12) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter. If  $nw = 0$ , let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  shall hold.

- 8 *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If  $nw = 0$ , let  $w_0 = 1$ . Otherwise, let  $w_k = fw(xmin + k \cdot \delta + \delta/2)$  for  $k = 0, \dots, n-1$ .

- 9 *Complexity:* The number of invocations of `fw` shall not exceed  $n$ .

```
vector<double> probabilities() const;
```

- 10 *Returns:* A `vector<double>` whose `size` member returns  $n$  and whose `operator[]` member returns  $p_k$  when invoked with argument  $k$  for  $k = 0, \dots, n-1$ .

#### 26.6.8.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

- 1 A `piecewise_constant_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.$$

- <sup>2</sup> The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n-1$ . Unless specified otherwise, the remaining  $n$  distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n-1,$$

in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```
template<class RealType = double>
class piecewise_constant_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    piecewise_constant_distribution();
    template<class InputIteratorB, class InputIteratorW>
        piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                        InputIteratorW firstW);

    template<class UnaryOperation>
        piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
        piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_constant_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

```
piecewise_constant_distribution();
```

- <sup>3</sup> *Effects:* Constructs a `piecewise_constant_distribution` object with  $n = 1$ ,  $\rho_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```
template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                               InputIteratorW firstW);
```

- <sup>4</sup> *Requires:* `InputIteratorB` and `InputIteratorW` shall each satisfy the requirements of an input iterator (Table 114) type. Moreover, `iterator_traits<InputIteratorB>::value_type` and `iterator_traits<InputIteratorW>::value_type` shall each denote a type that is convertible to `double`. If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,

$[firstB, lastB)$  shall form a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from  $firstW$  shall be at least  $n$ , and any  $w_k$  for  $k \geq n$  shall be ignored by the distribution.

5 *Effects:* Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

6 *Requires:* Each instance of type `UnaryOperation` shall be a function object (20.12) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter.

7 *Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw((b_{k+1} + b_k)/2)$  for  $k = 0, \dots, n-1$ .

8 *Complexity:* The number of invocations of `fw` shall not exceed  $n$ .

```
template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

9 *Requires:* Each instance of type `UnaryOperation` shall be a function object (20.12) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter. If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  shall hold.

10 *Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k + \delta/2)$  for  $k = 0, \dots, n-1$ .

11 *Complexity:* The number of invocations of `fw` shall not exceed  $n$ .

```
vector<result_type> intervals() const;
```

12 *Returns:* A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```
vector<result_type> densities() const;
```

13 *Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n-1$ .

### 26.6.8.6.3 Class template `piecewise_linear_distribution` [rand.dist.samp.plinear]

1 A `piecewise_linear_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.$$

2 The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n-1$ . Unless specified otherwise, the remaining  $n + 1$  distribution parameters are calculated as  $\rho_k = w_k/S$  for  $k = 0, \dots, n$ , in which the values  $w_k$ , commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).$$

```

template<class RealType = double>
class piecewise_linear_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<class InputIteratorB, class InputIteratorW>
        piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                      InputIteratorW firstW);
    template<class UnaryOperation>
        piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
        piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

```

```
piecewise_linear_distribution();
```

- 3      *Effects:* Constructs a `piecewise_linear_distribution` object with  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```

template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                             InputIteratorW firstW);

```

- 4      *Requires:* `InputIteratorB` and `InputIteratorW` shall each satisfy the requirements of an input iterator (Table 114) type. Moreover, `iterator_traits<InputIteratorB>::value_type` and `iterator_traits<InputIteratorW>::value_type` shall each denote a type that is convertible to `double`. If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,  $[firstB, lastB)$  shall form a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from `firstW` shall be at least  $n + 1$ , and any  $w_k$  for  $k \geq n + 1$  shall be ignored by the distribution.

- 5      *Effects:* Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```

template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

```

- 6 *Requires:* Each instance of type `UnaryOperation` shall be a function object (20.12) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter.
- 7 *Effects:* Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .
- 8 *Complexity:* The number of invocations of `fw` shall not exceed  $n + 1$ .

```
template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

- 9 *Requires:* Each instance of type `UnaryOperation` shall be a function object (20.12) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`'s sole parameter. If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  shall hold.
- 10 *Effects:* Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .
- 11 *Complexity:* The number of invocations of `fw` shall not exceed  $n + 1$ .

```
vector<result_type> intervals() const;
```

- 12 *Returns:* A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```
vector<result_type> densities() const;
```

- 13 *Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

## 26.7 Numeric arrays

[numarray]

### 26.7.1 Header `<valarray>` synopsis

[valarray.syn]

```
#include <initializer_list>

namespace std {

    template<class T> class valarray;           // An array of type T
    class slice;                               // a BLAS-like slice out of an array
    template<class T> class slice_array;
    class gslice;                             // a generalized slice out of an array
    template<class T> class gslice_array;
    template<class T> class mask_array;        // a masked array
    template<class T> class indirect_array;    // an indirected array

template <class T> unspecified1 end(valarray<T>& v);
template <class T> unspecified2 end(const valarray<T>& v);
}

```

- <sup>1</sup> The header <valarray> defines five class templates (valarray, slice\_array, gslice\_array, mask\_array, and indirect\_array), two classes (slice and gslice), and a series of related function templates for representing and manipulating arrays of values.
- <sup>2</sup> The valarray array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.
- <sup>3</sup> Any function returning a valarray<T> is permitted to return an object of another type, provided all the const member functions of valarray<T> are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.<sup>281</sup>

<sup>281</sup>) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

- 4 Implementations introducing such replacement types shall provide additional functions and operators as follows:
- (4.1) — for every function taking a `const valarray<T>&` other than `begin` and `end` (26.7.10), identical functions taking the replacement types shall be added;
  - (4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.
- 5 In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.
- 6 These library functions are permitted to throw a `bad_alloc` (18.6.3.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

## 26.7.2 Class template `valarray`

[template.valarray]

### 26.7.2.1 Class template `valarray` overview

[template.valarray.overview]

```
namespace std {
    template<class T> class valarray {
    public:
        typedef T value_type;

        // 26.7.2.2 construct/destroy:
        valarray();
        explicit valarray(size_t);
        valarray(const T&, size_t);
        valarray(const T*, size_t);
        valarray(const valarray&);
        valarray(valarray&&) noexcept;
        valarray(const slice_array<T>&);
        valarray(const gslice_array<T>&);
        valarray(const mask_array<T>&);
        valarray(const indirect_array<T>&);
        valarray(initializer_list<T>);
        ~valarray();

        // 26.7.2.3 assignment:
        valarray& operator=(const valarray&);
        valarray& operator=(valarray&&) noexcept;
        valarray& operator=(initializer_list<T>);
        valarray& operator=(const T&);
        valarray& operator=(const slice_array<T>&);
        valarray& operator=(const gslice_array<T>&);
        valarray& operator=(const mask_array<T>&);
        valarray& operator=(const indirect_array<T>&);

        // 26.7.2.4 element access:
        const T& operator[] (size_t) const;
        T& operator[] (size_t);

        // 26.7.2.5 subset operations:
        valarray operator[] (slice) const;
        slice_array<T> operator[] (slice);
        valarray operator[] (const gslice&) const;
```

```

gslice_array<T>    operator[] (const gslice&);
valarray          operator[] (const valarray<bool>&) const;
mask_array<T>     operator[] (const valarray<bool>&);
valarray          operator[] (const valarray<size_t>&) const;
indirect_array<T> operator[] (const valarray<size_t>&);

// 26.7.2.6 unary operators:
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

// 26.7.2.7 compound assignment:
valarray& operator*= (const T&);
valarray& operator/= (const T&);
valarray& operator%= (const T&);
valarray& operator+= (const T&);
valarray& operator-= (const T&);
valarray& operator^= (const T&);
valarray& operator&= (const T&);
valarray& operator|= (const T&);
valarray& operator<<= (const T&);
valarray& operator>>= (const T&);

valarray& operator*= (const valarray&);
valarray& operator/= (const valarray&);
valarray& operator%= (const valarray&);
valarray& operator+= (const valarray&);
valarray& operator-= (const valarray&);
valarray& operator^= (const valarray&);
valarray& operator&= (const valarray&);
valarray& operator|= (const valarray&);
valarray& operator<<= (const valarray&);
valarray& operator>>= (const valarray&);

// 26.7.2.8 member functions:
void swap(valarray&) noexcept;

size_t size() const;

T sum() const;
T min() const;
T max() const;

valarray shift (int) const;
valarray cshift(int) const;
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
void resize(size_t sz, T c = T());
};
}

```

<sup>1</sup> The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful

subsetting capabilities provided by the generalized subscript operators.<sup>282</sup>

- <sup>2</sup> An implementation is permitted to qualify any of the functions declared in `<valarray>` as `inline`.

### 26.7.2.2 `valarray` constructors

[`valarray.cons`]

```
valarray();
```

- <sup>1</sup> *Effects:* Constructs an object of class `valarray<T>`<sup>283</sup> which has zero length.<sup>284</sup>

```
explicit valarray(size_t);
```

- <sup>2</sup> The array created by this constructor has a length equal to the value of the argument. The elements of the array are value-initialized (8.5).

```
valarray(const T&, size_t);
```

- <sup>3</sup> The array created by this constructor has a length equal to the second argument. The elements of the array are initialized with the value of the first argument.

```
valarray(const T*, size_t);
```

- <sup>4</sup> The array created by this constructor has a length equal to the second argument `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.<sup>285</sup> If the value of the second argument is greater than the number of values pointed to by the first argument, the behavior is undefined.

```
valarray(const valarray&);
```

- <sup>5</sup> The array created by this constructor has the same length as the argument array. The elements are initialized with the values of the corresponding elements of the argument array.<sup>286</sup>

```
valarray(valarray&& v) noexcept;
```

- <sup>6</sup> The array created by this constructor has the same length as the argument array. The elements are initialized with the values of the corresponding elements of the argument array.

- <sup>7</sup> *Complexity:* Constant.

```
valarray(initializer_list<T> il);
```

- <sup>8</sup> *Effects:* Same as `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
```

```
valarray(const gslice_array<T>&);
```

```
valarray(const mask_array<T>&);
```

```
valarray(const indirect_array<T>&);
```

- <sup>9</sup> These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

- <sup>10</sup> The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

<sup>282</sup>) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporaries. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

<sup>283</sup>) For convenience, such objects are referred to as “arrays” throughout the remainder of 26.7.

<sup>284</sup>) This default constructor is essential, since arrays of `valarray` may be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

<sup>285</sup>) This constructor is the preferred method for converting a C array to a `valarray` object.

<sup>286</sup>) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they shall implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

**26.7.2.3 valarray assignment****[valarray.assign]**

```
valarray& operator=(const valarray& v);
```

- 1 Each element of the *\*this* array is assigned the value of the corresponding element of the argument array. If the length of *v* is not equal to the length of *\*this*, resizes *\*this* to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

- 2 *Postcondition:* `size() == v.size()`.

```
valarray& operator=(valarray&& v) noexcept;
```

- 3 *Effects:* *\*this* obtains the value of *v*. The value of *v* after the assignment is not specified.

- 4 *Complexity:* Linear.

```
valarray& operator=(initializer_list<T> il);
```

- 5 *Effects:* As if by: `*this = valarray(il);`

- 6 *Returns:* *\*this*.

```
valarray& operator=(const T&);
```

- 7 The scalar assignment operator causes each element of the *\*this* array to be assigned the value of the argument.

```
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);
```

- 8 *Requires:* The length of the array to which the argument refers equals `size()`.

- 9 These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

- 10 If the value of an element in the left-hand side of a `valarray` assignment operator depends on the value of another element in that left-hand side, the resulting behavior is undefined.

**26.7.2.4 valarray element access****[valarray.access]**

```
const T& operator[](size_t) const;
T& operator[](size_t);
```

- 1 The subscript operator returns a reference to the corresponding element of the array.

- 2 Thus, the expression `(a[i] = q, a[i]) == q` evaluates as true for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of *i* is less than the length of *a*.

- 3 The expression `&a[i+j] == &a[i] + j` evaluates as true for all `size_t i` and `size_t j` such that *i+j* is less than the length of the array *a*.

- 4 Likewise, the expression `&a[i] != &b[j]` evaluates as true for any two arrays *a* and *b* and for any `size_t i` and `size_t j` such that *i* is less than the length of *a* and *j* is less than the length of *b*. This property indicates an absence of aliasing and may be used to advantage by optimizing compilers.<sup>287</sup>

- 5 The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (26.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

- 6 If the subscript operator is invoked with a `size_t` argument whose value is not less than the length of the array, the behavior is undefined.

<sup>287</sup>) Compilers may take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarrays`.

**26.7.2.5 valarray subset operations****[valarray.sub]**

- <sup>1</sup> The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) must exist.

```
valarray operator[](slice slicearr) const;
```

- <sup>2</sup> *Returns:* An object of class `valarray<T>` containing those elements of the controlled sequence designated by `slicearr`. [*Example:*

```
const valarray<char> v0("abcdefghijklmnop", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
```

— *end example*]

```
slice_array<T> operator[](slice slicearr);
```

- <sup>3</sup> *Returns:* An object that holds references to elements of the controlled sequence selected by `slicearr`. [*Example:*

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
```

— *end example*]

```
valarray operator[](const gslice& gslicearr) const;
```

- <sup>4</sup> *Returns:* An object of class `valarray<T>` containing those elements of the controlled sequence designated by `gslicearr`. [*Example:*

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

— *end example*]

```
gslice_array<T> operator[](const gslice& gslicearr);
```

- <sup>5</sup> *Returns:* An object that holds references to elements of the controlled sequence selected by `gslicearr`. [*Example:*

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```

— *end example*]

```
valarray operator[](const valarray<bool>& boolarr) const;
```

- 6 *Returns:* An object of class `valarray<T>` containing those elements of the controlled sequence designated by `boolarr`. [*Example:*

```
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```

— *end example*]

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

- 7 *Returns:* An object that holds references to elements of the controlled sequence selected by `boolarr`. [*Example:*

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
```

— *end example*]

```
valarray operator[](const valarray<size_t>& indarr) const;
```

- 8 *Returns:* An object of class `valarray<T>` containing those elements of the controlled sequence designated by `indarr`. [*Example:*

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
```

— *end example*]

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

- 9 *Returns:* An object that holds references to elements of the controlled sequence selected by `indarr`. [*Example:*

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEijklmnop", 16)
```

— *end example*]

#### 26.7.2.6 valarray unary operators

[`valarray.unary`]

```
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;
```

- 1 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T (**bool** for **operator!**) or which may be unambiguously implicitly converted to type T (**bool** for **operator!**).
- 2 Each of these operators returns an array whose length is equal to the length of the array. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

### 26.7.2.7 valarray compound assignment

[valarray.cassign]

```
valarray& operator*= (const valarray&);
valarray& operator/= (const valarray&);
valarray& operator%= (const valarray&);
valarray& operator+= (const valarray&);
valarray& operator-= (const valarray&);
valarray& operator^= (const valarray&);
valarray& operator&= (const valarray&);
valarray& operator|= (const valarray&);
valarray& operator<<=(const valarray&);
valarray& operator>>=(const valarray&);
```

- 1 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied. Each of these operators performs the indicated operation on each of its elements and the corresponding element of the argument array.
- 2 The array is then returned by reference.
- 3 If the array and the argument array do not have the same length, the behavior is undefined. The appearance of an array on the left-hand side of a compound assignment does **not** invalidate references or pointers.
- 4 If the value of an element in the left-hand side of a valarray compound assignment operator depends on the value of another element in that left hand side, the resulting behavior is undefined.

```
valarray& operator*= (const T&);
valarray& operator/= (const T&);
valarray& operator%= (const T&);
valarray& operator+= (const T&);
valarray& operator-= (const T&);
valarray& operator^= (const T&);
valarray& operator&= (const T&);
valarray& operator|= (const T&);
valarray& operator<<=(const T&);
valarray& operator>>=(const T&);
```

- 5 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied.
- 6 Each of these operators applies the indicated operation to each element of the array and the non-array argument.
- 7 The array is then returned by reference.
- 8 The appearance of an array on the left-hand side of a compound assignment does *not* invalidate references or pointers to the elements of the array.

### 26.7.2.8 valarray member functions

[valarray.members]

```
void swap(valarray& v) noexcept;
```

1       *Effects:* `*this` obtains the value of `v`. `v` obtains the value of `*this`.

2       *Complexity:* Constant.

`size_t size() const;`

3       *Returns:* The number of elements in the array.

4       *Complexity:* Constant time.

`T sum() const;`

This function may only be instantiated for a type `T` to which `operator+=` can be applied. This function returns the sum of all the elements of the array.

5       If the array has length 0, the behavior is undefined. If the array has length 1, `sum()` returns the value of element 0. Otherwise, the returned value is calculated by applying `operator+=` to a copy of an element of the array and all other elements of the array in an unspecified order.

`T min() const;`

6       This function returns the minimum value contained in `*this`. The value returned for an array of length 0 is undefined. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

`T max() const;`

7       This function returns the maximum value contained in `*this`. The value returned for an array of length 0 is undefined. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

`valarray shift(int n) const;`

8       This function returns an object of class `valarray<T>` of length `size()`, each of whose elements `I` is `(*this)[I + n]` if `I + n` is non-negative and less than `size()`, otherwise `T()`. Thus if element zero is taken as the leftmost element, a positive value of `n` shifts the elements left `n` places, with zero fill.

9       [*Example:* If the argument has the value -2, the first two elements of the result will be value-initialized (8.5); the third element of the result will be assigned the value of the first element of the argument; etc. — *end example*]

`valarray cshift(int n) const;`

10       This function returns an object of class `valarray<T>` of length `size()` that is a circular shift of `*this`. If element zero is taken as the leftmost element, a non-negative value of `n` shifts the elements circularly left `n` places and a negative value of `n` shifts the elements circularly right `-n` places.

`valarray apply(T func(T)) const;`

`valarray apply(T func(const T&)) const;`

11       These functions return an array whose length is equal to the array. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of the array.

`void resize(size_t sz, T c = T());`

12       This member function changes the length of the `*this` array to `sz` and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

**26.7.3 valarray non-member operations**

[valarray.nonmembers]

**26.7.3.1 valarray binary operators**

[valarray.binary]

```

template<class T> valarray<T> operator*
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator%
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator-
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator&
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator|
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>
    (const valarray<T>&, const valarray<T>&);

```

- 1 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T or which can be unambiguously implicitly converted to type T.
- 2 Each of these operators returns an array whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
- 3 If the argument arrays do not have the same length, the behavior is undefined.

```

template<class T> valarray<T> operator* (const valarray<T>&, const T&);
template<class T> valarray<T> operator* (const T&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const T&);
template<class T> valarray<T> operator/ (const T&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const T&);
template<class T> valarray<T> operator% (const T&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const T&);
template<class T> valarray<T> operator+ (const T&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const T&);
template<class T> valarray<T> operator- (const T&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const T&);
template<class T> valarray<T> operator^ (const T&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const T&);
template<class T> valarray<T> operator& (const T&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const T&);
template<class T> valarray<T> operator| (const T&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const T&);
template<class T> valarray<T> operator<<(const T&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const T&);
template<class T> valarray<T> operator>>(const T&, const valarray<T>&);

```

- 4 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T or which can be

unambiguously implicitly converted to type T.

- 5 Each of these operators returns an array whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

### 26.7.3.2 valarray logical operators

[valarray.comparison]

```
template<class T> valarray<bool> operator==(
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator||
    (const valarray<T>&, const valarray<T>&);
```

- 1 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type bool or which can be unambiguously implicitly converted to type bool.
- 2 Each of these operators returns a bool array whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
- 3 If the two array arguments do not have the same length, the behavior is undefined.

```
template<class T> valarray<bool> operator==(const valarray<T>&, const T&);
template<class T> valarray<bool> operator==(const T&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const T&);
template<class T> valarray<bool> operator!=(const T&, const valarray<T>&);
template<class T> valarray<bool> operator<(const valarray<T>&, const T&);
template<class T> valarray<bool> operator<(const T&, const valarray<T>&);
template<class T> valarray<bool> operator>(const valarray<T>&, const T&);
template<class T> valarray<bool> operator>(const T&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const T&);
template<class T> valarray<bool> operator<=(const T&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const T&);
template<class T> valarray<bool> operator>=(const T&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const T&);
template<class T> valarray<bool> operator&&(const T&, const valarray<T>&);
template<class T> valarray<bool> operator|| (const valarray<T>&, const T&);
template<class T> valarray<bool> operator|| (const T&, const valarray<T>&);
```

- 4 Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type bool or which can be unambiguously implicitly converted to type bool.
- 5 Each of these operators returns a bool array whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

**26.7.3.3 valarray transcendentals**

[valarray.transcend]

```

template<class T> valarray<T> abs (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const T&);
template<class T> valarray<T> atan2(const T&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
template<class T> valarray<T> log (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow
    (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const T&);
template<class T> valarray<T> pow (const T&, const valarray<T>&);
template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

```

- <sup>1</sup> Each of these functions may only be instantiated for a type T to which a unique function with the indicated name can be applied (unqualified). This function shall return a value which is of type T or which can be unambiguously implicitly converted to type T.

**26.7.3.4 valarray specialized algorithms**

[valarray.special]

```
template <class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

- <sup>1</sup> *Effects:* As if by `x.swap(y)`.

**26.7.4 Class slice**

[class.slice]

**26.7.4.1 Class slice overview**

[class.slice.overview]

```

namespace std {
    class slice {
    public:
        slice();
        slice(size_t, size_t, size_t);

        size_t start() const;
        size_t size() const;
        size_t stride() const;
    };
}

```

- <sup>1</sup> The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.<sup>288</sup>

**26.7.4.2 slice constructors**

[cons.slice]

<sup>288</sup>) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs may instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

```

slice();
slice(size_t start, size_t length, size_t stride);
slice(const slice&);

```

- 1 The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.
- 2 [*Example: slice(3, 8, 2) constructs a slice which selects elements 3, 5, 7, ... 17 from an array. — end example*]

#### 26.7.4.3 slice access functions

[slice.access]

```

size_t start() const;
size_t size() const;
size_t stride() const;

```

- 1 *Returns:* The start, length, or stride specified by a `slice` object.
- 2 *Complexity:* Constant time.

### 26.7.5 Class template `slice_array`

[template.slice.array]

#### 26.7.5.1 Class template `slice_array` overview

[template.slice.array.overview]

```

namespace std {
    template <class T> class slice_array {
    public:
        typedef T value_type;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%=(const valarray<T>&) const;
        void operator+=(const valarray<T>&) const;
        void operator-=(const valarray<T>&) const;
        void operator^=(const valarray<T>&) const;
        void operator&=(const valarray<T>&) const;
        void operator|=(const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        slice_array(const slice_array&);
        ~slice_array();
        const slice_array& operator=(const slice_array&) const;
        void operator=(const T&) const;

        slice_array() = delete;          // as implied by declaring copy constructor above
    };
}

```

- 1 The `slice_array` template is a helper template used by the `slice` subscript operator
- ```

slice_array<T> valarray<T>::operator[] (slice);

```

It has reference semantics to a subset of an array specified by a `slice` object.

- 2 [*Example: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are 1, 4, ..., 13. — end example*]

#### 26.7.5.2 slice\_array assignment

[slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

### 26.7.5.3 `slice_array` compound assignment

[slice.arr.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<=<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

### 26.7.5.4 `slice_array` fill function

[slice.arr.fill]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

## 26.7.6 The `gslice` class

[class.gslice]

### 26.7.6.1 The `gslice` class overview

[class.gslice.overview]

```
namespace std {
    class gslice {
    public:
        gslice();
        gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

        size_t      start() const;
        valarray<size_t> size() const;
        valarray<size_t> stride() const;
    };
}
```

- <sup>1</sup> This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset ( $s$ ), a set of lengths ( $l_j$ ), and a set of strides ( $d_j$ ). The number of lengths shall equal the number of strides.
- <sup>2</sup> A `gslice` represents a mapping from a set of indices ( $i_j$ ), equal in number to the number of strides, to a single index  $k$ . It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices  $i_j$  range in value from 0 to  $l_{ij} - 1$ .

- <sup>3</sup> [Example: The `gslice` specification]

```

start = 3
length = {2, 4, 3}
stride = {19, 4, 1}

```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

| $(i_0,$ | $i_1,$ | $i_2,$ | $k)$ | $=$ |
|---------|--------|--------|------|-----|
| (0,     | 0,     | 0,     | 3),  |     |
| (0,     | 0,     | 1,     | 4),  |     |
| (0,     | 0,     | 2,     | 5),  |     |
| (0,     | 1,     | 0,     | 7),  |     |
| (0,     | 1,     | 1,     | 8),  |     |
| (0,     | 1,     | 2,     | 9),  |     |
| (0,     | 2,     | 0,     | 11), |     |
| (0,     | 2,     | 1,     | 12), |     |
| (0,     | 2,     | 2,     | 13), |     |
| (0,     | 3,     | 0,     | 15), |     |
| (0,     | 3,     | 1,     | 16), |     |
| (0,     | 3,     | 2,     | 17), |     |
| (1,     | 0,     | 0,     | 22), |     |
| (1,     | 0,     | 1,     | 23), |     |
| ...     |        |        |      |     |
| (1,     | 3,     | 2,     | 36)  |     |

That is, the highest-ordered index turns fastest. — *end example*]

<sup>4</sup> It is possible to have degenerate generalized slices in which an address is repeated.

<sup>5</sup> [*Example:* If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

|     |    |    |     |
|-----|----|----|-----|
| (0, | 0, | 0, | 3), |
| (0, | 0, | 1, | 4), |
| (0, | 0, | 2, | 5), |
| (0, | 1, | 0, | 4), |
| (0, | 1, | 1, | 5), |

— *end example*]

<sup>6</sup> If a degenerate slice is used as the argument to the non-const version of `operator[] (const gslice&)`, the resulting behavior is undefined.

### 26.7.6.2 gslice constructors

[gslice.cons]

```

gslice();
gslice(size_t start, const valarray<size_t>& lengths,
       const valarray<size_t>& strides);
gslice(const gslice&);

```

- <sup>1</sup> The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous section.

### 26.7.6.3 `gslice` access functions

[gslice.access]

```
size_t      start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

- <sup>1</sup> *Returns:* The representation of the start, lengths, or strides specified for the `gslice`.
- <sup>2</sup> *Complexity:* `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

## 26.7.7 Class template `gslice_array`

[template.gslice.array]

### 26.7.7.1 Class template `gslice_array` overview

[template.gslice.array.overview]

```
namespace std {
    template <class T> class gslice_array {
    public:
        typedef T value_type;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%=(const valarray<T>&) const;
        void operator+=(const valarray<T>&) const;
        void operator-=(const valarray<T>&) const;
        void operator^=(const valarray<T>&) const;
        void operator&=(const valarray<T>&) const;
        void operator|=(const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        gslice_array(const gslice_array&);
        ~gslice_array();
        const gslice_array& operator=(const gslice_array&) const;
        void operator=(const T&) const;

        gslice_array() = delete;      // as implied by declaring copy constructor above
    };
}
```

- <sup>1</sup> This template is a helper template used by the `slice` subscript operator

```
gslice_array<T> valarray<T>::operator[] (const gslice&);
```

- <sup>2</sup> It has reference semantics to a subset of an array specified by a `gslice` object.
- <sup>3</sup> Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

### 26.7.7.2 `gslice_array` assignment

[gslice.array.assign]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

**26.7.7.3 gslice\_array compound assignment****[gslice.array.comp.assign]**

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

**26.7.7.4 gslice\_array fill function****[gslice.array.fill]**

```

void operator=(const T&) const;

```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

**26.7.8 Class template mask\_array****[template.mask.array]****26.7.8.1 Class template mask\_array overview****[template.mask.array.overview]**

```

namespace std {
    template <class T> class mask_array {
    public:
        typedef T value_type;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<= (const valarray<T>&) const;
        void operator>>= (const valarray<T>&) const;

        mask_array(const mask_array&);
        ~mask_array();
        const mask_array& operator=(const mask_array&) const;
        void operator=(const T&) const;

        mask_array() = delete;           // as implied by declaring copy constructor above
    };
}

```

- <sup>1</sup> This template is a helper template used by the mask subscript operator:

```

mask_array<T> valarray<T>::operator[] (const valarray<bool>&).

```

- <sup>2</sup> It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`.)

### 26.7.8.2 mask\_array assignment

[mask.array.assign]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

- <sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

### 26.7.8.3 mask\_array compound assignment

[mask.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;
```

- <sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the mask object refers.

### 26.7.8.4 mask\_array fill function

[mask.array.fill]

```
void operator=(const T&) const;
```

- <sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

## 26.7.9 Class template indirect\_array

[template.indirect.array]

### 26.7.9.1 Class template indirect\_array overview

[template.indirect.array.overview]

```
namespace std {
    template <class T> class indirect_array {
    public:
        typedef T value_type;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<= (const valarray<T>&) const;
        void operator>>= (const valarray<T>&) const;

        indirect_array(const indirect_array&);
        ~indirect_array();
        const indirect_array& operator=(const indirect_array&) const;
```

```

    void operator=(const T&) const;

    indirect_array() = delete;           // as implied by declaring copy constructor above
};
}

```

<sup>1</sup> This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&).
```

<sup>2</sup> It has reference semantics to a subset of an array specified by an `indirect_array`. Thus the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

### 26.7.9.2 indirect\_array assignment

[indirect.array.assign]

```

void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;

```

<sup>1</sup> These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

<sup>2</sup> If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

<sup>3</sup> [Example:

```

    int addr[] = {2, 3, 1, 4, 4};
    valarray<size_t> indirect(addr, 5);
    valarray<double> a(0., 10), b(1., 5);
    a[indirect] = b;

```

results in undefined behavior since element 4 is specified twice in the indirection. — end example]

### 26.7.9.3 indirect\_array compound assignment

[indirect.array.comp.assign]

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

```

<sup>1</sup> These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.

<sup>2</sup> If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

### 26.7.9.4 indirect\_array fill function

[indirect.array.fill]

```
void operator=(const T&) const;
```

<sup>1</sup> This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

**26.7.10 valarray range access****[valarray.range]**

- <sup>1</sup> In the `begin` and `end` function templates that follow, *unspecified1* is a type that meets the requirements of a mutable random access iterator (24.2.7) and of a contiguous iterator (24.2.1) whose `value_type` is the template parameter `T` and whose `reference` type is `T&`. *unspecified2* is a type that meets the requirements of a constant random access iterator (24.2.7) and of a contiguous iterator (24.2.1) whose `value_type` is the template parameter `T` and whose `reference` type is `const T&`.
- <sup>2</sup> The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (26.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template <class T> unspecified1 begin(valarray<T>& v);
template <class T> unspecified2 begin(const valarray<T>& v);
```

- <sup>3</sup> *Returns:* An iterator referencing the first value in the numeric array.

```
template <class T> unspecified1 end(valarray<T>& v);
template <class T> unspecified2 end(const valarray<T>& v);
```

- <sup>4</sup> *Returns:* An iterator referencing one past the last value in the numeric array.

**26.8 Generalized numeric operations****[numeric.ops]****26.8.1 Header <numeric> synopsis****[numeric.ops.overview]**

```
namespace std {
    template <class InputIterator, class T>
        T accumulate(InputIterator first, InputIterator last, T init);
    template <class InputIterator, class T, class BinaryOperation>
        T accumulate(InputIterator first, InputIterator last, T init,
                     BinaryOperation binary_op);

    template<class InputIterator>
        typename iterator_traits<InputIterator>::value_type
        reduce(InputIterator first, InputIterator last);
    template<class InputIterator, class T>
        T reduce(InputIterator first, InputIterator last, T init);
    template<class InputIterator, class T, class BinaryOperation>

template <class ExecutionPolicy, class InputIterator, class OutputIterator,
        class BinaryOperation>
OutputIterator adjacent_difference(ExecutionPolicy&& exec, // see 25.2.5
        InputIterator first,
        InputIterator last,
        OutputIterator result,
        BinaryOperation binary_op);

template <class ForwardIterator, class T>
void iota(ForwardIterator first, ForwardIterator last, T value);
}

```

- <sup>1</sup> The requirements on the types of algorithms' arguments that are described in the introduction to Clause 25 also apply to the following algorithms.

## 26.8.2 Accumulate

[accumulate]

```

template <class InputIterator, class T>
T accumulate(InputIterator first, InputIterator last, T init);
template <class InputIterator, class T, class BinaryOperation>
T accumulate(InputIterator first, InputIterator last, T init,
        BinaryOperation binary_op);

```

- 1 *Effects:* Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifies it with `acc = acc + *i` or `acc = binary_op(acc, *i)` for every iterator `i` in the range `[first, last)` in order.<sup>289</sup>
- 2 *Requires:* `T` shall meet the requirements of `CopyConstructible` (Table 21) and `CopyAssignable` (Table 23) types. In the range `[first, last]`, `binary_op` shall neither modify elements nor invalidate iterators or subranges.<sup>290</sup>

### 26.8.3 Reduce

[reduce]

```
template<class InputIterator>
    typename iterator_traits<InputIterator>::value_type
    reduce(InputIterator first, InputIterator last);
```

- 1 *Effects:* Equivalent to: `return reduce(first, last, typename iterator_traits<InputIterator>::value_type{});`

```
template<class InputIterator, class T>
    T reduce(InputIterator first, InputIterator last, T init);
```

- 2 *Effects:* Equivalent to: `return reduce(first, last, init, plus<>());`

```
template<class InputIterator, class T, class BinaryOperation>
    T reduce(InputIterator first, InputIterator last, T init,
             BinaryOperation binary_op);
```

- 3 *Returns:* `GENERALIZED_SUM(binary_op, init, *i, ...)` for every `i` in `[first, last)`.
- 4 *Requires:* `binary_op` shall neither invalidate iterators or subranges, nor modify elements in the range `[first, last)`.
- 5 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications of `binary_op`.
- 6 *Notes:* The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a non-deterministic result for non-associative or non-commutative `binary_op` such as floating-point addition.

### 26.8.4 Transform reduce

[transform.reduce]

```
template<class InputIterator, class UnaryFunction, class T, class BinaryOperation>
    T transform_reduce(InputIterator first, InputIterator last,
                      UnaryFunction unary_op, T init, BinaryOperation binary_op);
```

- 1 *Returns:* `GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)` for every `i` in `[first, last)`.
- 2 *Requires:* Neither `unary_op` nor `binary_op` shall invalidate subranges, or modify elements in the range `[first, last)`.
- 3 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.
- 4 *Notes:* `transform_reduce` does not apply `unary_op` to `init`.

### 26.8.5 Inner product

[inner.product]

```
template <class InputIterator1, class InputIterator2, class T>
    T inner_product(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, T init);
template <class InputIterator1, class InputIterator2, class T,
```

289) `accumulate` is similar to the APL reduction operator and Common Lisp `reduce` function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

290) The use of fully closed ranges is intentional

```

        class BinaryOperation1, class BinaryOperation2>
    T inner_product(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, T init,
                   BinaryOperation1 binary_op1,
                   BinaryOperation2 binary_op2);

```

- 1 *Effects:* Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = acc + (*i1) * (*i2)` or `acc = binary_op1(acc, binary_op2(*i1, *i2))` for every iterator `i1` in the range `[first1, last1)` and iterator `i2` in the range `[first2, first2 + (last1 - first1))` in order.
- 2 *Requires:* `T` shall meet the requirements of `CopyConstructible` (Table 21) and `CopyAssignable` (Table 23) types. In the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]` `binary_op1` and `binary_op2` shall neither modify elements nor invalidate iterators or subranges.<sup>291</sup>

## 26.8.6 Partial sum

[partial.sum]

```

template <class InputIterator, class OutputIterator>
    OutputIterator partial_sum(
        InputIterator first, InputIterator last,
        OutputIterator result);
template <class InputIterator, class OutputIterator, class BinaryOperation>
    OutputIterator partial_sum(
        InputIterator first, InputIterator last,
        OutputIterator result, BinaryOperation binary_op);

```

- 1 *Effects:* For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, `acc` is then modified by `acc = acc + *i` or `acc = binary_op(acc, *i)` and the result is assigned to `*(result + (i - first))`.
- 2 *Returns:* `result + (last - first)`.
- 3 *Complexity:* Exactly `(last - first) - 1` applications of the binary operation.
- 4 *Requires:* `InputIterator`'s value type shall be constructible from the type of `*first`. The result of the expression `acc + *i` or `binary_op(acc, *i)` shall be implicitly convertible to `InputIterator`'s value type. `acc` shall be writable (24.2.1) to the `result` output iterator. In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` shall neither modify elements nor invalidate iterators or subranges.<sup>292</sup>
- 5 *Remarks:* `result` may be equal to `first`.

## 26.8.7 Exclusive scan

[exclusive.scan]

```

template<class InputIterator, class OutputIterator, class T>
    OutputIterator exclusive_scan(InputIterator first, InputIterator last,
                                OutputIterator result,
                                T init);

```

- 1 *Effects:* Equivalent to: `return exclusive_scan(first, last, result, init, plus<>());`

```

template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
    OutputIterator exclusive_scan(InputIterator first, InputIterator last,
                                OutputIterator result,
                                T init, BinaryOperation binary_op);

```

291) The use of fully closed ranges is intentional

292) The use of fully closed ranges is intentional.

- 2 *Effects:* Assigns through each iterator *i* in `[result, result + (last - first))` the value of
- (2.1) — `init`, if *i* is `result`, otherwise
- (2.2) — `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *j, ...)` for every *j* in `[first, first + (i - result) - 1)`.
- 3 *Returns:* The end of the resulting range beginning at `result`.
- 4 *Requires:* `binary_op` shall neither invalidate iterators or subranges, nor modify elements in the ranges `[first, last)` or `[result, result + (last - first))`.
- 5 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications of `binary_op`.
- 6 *Notes:* The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the *i*th input element from the *i*th sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` may be non-deterministic.
- 7 *Remarks:* `result` may be equal to `first`.

### 26.8.8 Inclusive scan

[inclusive.scan]

```
template<class InputIterator, class OutputIterator>
    OutputIterator inclusive_scan(InputIterator first, InputIterator last,
                                OutputIterator result);
```

- 1 *Effects:* Equivalent to: `return inclusive_scan(first, last, result, plus<>());`

```
template<class InputIterator, class OutputIterator, class BinaryOperation>
    OutputIterator inclusive_scan(InputIterator first, InputIterator last,
                                OutputIterator result,
                                BinaryOperation binary_op);
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
    OutputIterator inclusive_scan(InputIterator first, InputIterator last,
                                OutputIterator result,
                                BinaryOperation binary_op, T init);
```

- 2 *Effects:* Assigns through each iterator *i* in `[result, result + (last - first))` the value of
- (2.1) — `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *j, ...)` for every *j* in `[first, first + (i - result))` if `init` is provided, or
- (2.2) — `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, *j, ...)` for every *j* in `[first, first + (i - result))` otherwise.
- 3 *Returns:* The end of the resulting range beginning at `result`.
- 4 *Requires:* `binary_op` shall not invalidate iterators or subranges, nor modify elements in the ranges `[first, last)` or `[result, result + (last - first))`.
- 5 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications of `binary_op`.
- 6 *Remarks:* `result` may be equal to `first`.
- 7 *Notes:* The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the *i*th input element in the *i*th sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` may be non-deterministic.

**26.8.9 Transform exclusive scan****[transform.exclusive.scan]**

```
template<class InputIterator, class OutputIterator,
        class UnaryOperation,
        class T, class BinaryOperation>
OutputIterator transform_exclusive_scan(InputIterator first, InputIterator last,
                                       OutputIterator result,
                                       UnaryOperation unary_op,
                                       T init, BinaryOperation binary_op);
```

- 1 *Effects:* Assigns through each iterator *i* in `[result, result + (last - first))` the value of
- (1.1) — `init`, if *i* is `result`, otherwise
- (1.2) — `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, unary_op(*j), ...)` for every *j* in `[first, first + (i - result) - 1)`.
- 2 *Returns:* The end of the resulting range beginning at `result`.
- 3 *Requires:* Neither `unary_op` nor `binary_op` shall invalidate iterators or subranges, or modify elements in the ranges `[first, last)` or `[result, result + (last - first))`.
- 4 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.
- 5 *Remarks:* `result` may be equal to `first`.
- 6 *Notes:* The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the *i*th input element from the *i*th sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` may be non-deterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`.

**26.8.10 Transform inclusive scan****[transform.inclusive.scan]**

```
template<class InputIterator, class OutputIterator,
        class UnaryOperation,
        class BinaryOperation>
OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
                                       OutputIterator result,
                                       UnaryOperation unary_op,
                                       BinaryOperation binary_op);

template<class InputIterator, class OutputIterator,
        class UnaryOperation,
        class BinaryOperation, class T>
OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
                                       OutputIterator result,
                                       UnaryOperation unary_op,
                                       BinaryOperation binary_op, T init);
```

- 1 *Effects:* Assigns through each iterator *i* in `[result, result + (last - first))` the value of
- (1.1) — `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, unary_op(*j), ...)` for every *j* in `[first, first + (i - result))` if `init` is provided, or
- (1.2) — `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, unary_op(*j), ...)` for every *j* in `[first, first + (i - result))` otherwise.
- 2 *Returns:* The end of the resulting range beginning at `result`.
- 3 *Requires:* Neither `unary_op` nor `binary_op` shall invalidate iterators or subranges, or modify elements in the ranges `[first, last)` or `[result, result + (last - first))`.
- 4 *Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

- 5 *Remarks:* `result` may be equal to `first`.
- 6 *Notes:* The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the `ith` input element in the `ith` sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` may be non-deterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`.

### 26.8.11 Adjacent difference

[`adjacent.difference`]

```
template <class InputIterator, class OutputIterator>
    OutputIterator adjacent_difference(
        InputIterator first, InputIterator last,
        OutputIterator result);
template <class InputIterator, class OutputIterator, class BinaryOperation>
    OutputIterator adjacent_difference(
        InputIterator first, InputIterator last,
        OutputIterator result,
        BinaryOperation binary_op);
```

- 1 *Effects:* For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, creates an object `val` whose type is `InputIterator`'s value type, initializes it with `*i`, computes `val - acc` or `binary_op(val, acc)`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.
- 2 *Requires:* `InputIterator`'s value type shall be `MoveAssignable` (Table 22) and shall be constructible from the type of `*first`. `acc` shall be writable (24.2.1) to the `result` output iterator. The result of the expression `val - acc` or `binary_op(val, acc)` shall be writable to the `result` output iterator. In the ranges `[first, last]` and `[result, result + (last - first))`, `binary_op` shall neither modify elements nor invalidate iterators or subranges.<sup>293</sup>
- 3 *Remarks:* `result` may be equal to `first`.
- 4 *Returns:* `result + (last - first)`.
- 5 *Complexity:* Exactly `(last - first) - 1` applications of the binary operation.

### 26.8.12 Iota

[`numeric.iota`]

```
template <class ForwardIterator, class T>
    void iota(ForwardIterator first, ForwardIterator last, T value);
```

- 1 *Requires:* `T` shall be convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, shall be well formed.
- 2 *Effects:* For each element referred to by the iterator `i` in the range `[first, last)`, assigns `*i = value` and increments `value` as if by `++value`.
- 3 *Complexity:* Exactly `last - first` increments and assignments.

## 26.9 C library

[`c.math`]

- 1 The header `<ctgmath>` simply includes the headers `<ccomplex>` and `<cmath>`.
- 2 [ *Note:* The overloads provided in C by type-generic macros are already provided in `<ccomplex>` and `<cmath>` by “sufficient” additional overloads. — *end note* ]
- 3 Tables 126 and 127 describe headers `<cmath>` and `<cstdlib>`, respectively.

<sup>293</sup>) The use of fully closed ranges is intentional.

Table 126 — Header &lt;cmath&gt; synopsis

| Type                                 | Name(s)        |               |            |                  |
|--------------------------------------|----------------|---------------|------------|------------------|
| Macros:                              |                |               |            |                  |
| FP_FAST_FMA                          | FP_ILOGBNAN    | FP_SUBNORMAL  | HUGE_VALL  | MATH_ERRNO       |
| FP_FAST_FMAF                         | FP_INFINITE    | FP_ZERO       | INFINITY   | MATH_ERREXCEPT   |
| FP_FAST_FMAL                         | FP_NAN         | HUGE_VAL      | NAN        | math_errhandling |
| FP_ILOGB0                            | FP_NORMAL      | HUGE_VALF     |            |                  |
| Types:                               | double_t       | float_t       |            |                  |
| Math Functions:                      |                |               |            |                  |
| abs                                  | cosh           | fmod          | logb       | remquo           |
| acos                                 | erf            | frexp         | lrint      | rint             |
| acosh                                | erfc           | hypot         | lround     | round            |
| asin                                 | exp2           | ilogb         | modf       | scalbln          |

| Classification/comparison Functions: |                |               |            |                  |
| fpclassify                           | isgreaterequal | islessequal   | isnan      | isunordered      |
| isfinite                             | isinf          | islessgreater | isnormal   | signbit          |
| isgreater                            | isless         |               |            |                  |

Table 127 — Header &lt;cstdlib&gt; synopsis

| Type       | Name(s)  |         |
|------------|----------|---------|
| Macro:     | RAND_MAX |         |
| Types:     |          |         |
| div_t      | ldiv_t   | lldiv_t |
| Functions: |          |         |
| abs        | ldiv     | rand    |
| div        | llabs    | srand   |
| labs       | lldiv    |         |

- <sup>4</sup> The contents of these headers are the same as the Standard C library headers `<math.h>` and `<stdlib.h>` respectively, with the following changes:
- <sup>5</sup> The `rand` function has the semantics specified in the C standard, except that the implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (17.6.5.9). [ *Note*: The random number generation (26.6) facilities in this standard are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be nonportable, with unpredictable and oft-questionable quality and performance. — *end note* ]
- <sup>6</sup> In addition to the `int` versions of certain math functions in `<cstdlib>`, C++ adds `long` and `long long` overloaded versions of these functions, with the same semantics.
- <sup>7</sup> The added signatures are:

```
long abs(long);                // labs()
long long abs(long long);      // llabs()
ldiv_t div(long, long);        // ldiv()
lldiv_t div(long long, long long); // lldiv()
```

- <sup>8</sup> To avoid ambiguities, C++ also adds the following overloads of `abs()` to `<cmath>`, with the semantics defined in `<cmath>`:

```
float abs(float);
double abs(double);
long double abs(long double);
```

- <sup>9</sup> To avoid ambiguities, C++ also adds the following overloads of `abs()` to `<cmath>`, with the semantics defined in `<cstdlib>`:

```
int abs(int);
long abs(long);
long long abs(long long);
```

- <sup>10</sup> If `abs()` is called with an argument of type `X` for which `is_unsigned<X>::value` is `true` and if `X` cannot be converted to `int` by integral promotion (4.5), the program is ill-formed. [ *Note*: Arguments that can be promoted to `int` are permitted for compatibility with C. — *end note* ]
- <sup>11</sup> In addition to the `double` versions of the math functions in `<cmath>`, C++ adds `float` and `long double` overloaded versions of these functions, with the same semantics.
- <sup>12</sup> The added signatures are:

```
float abs(float);
float acos(float);
float acosh(float);
float asin(float);
float asinh(float);
float atan(float);
float atan2(float, float);
float atanh(float);
float cbrt(float);
float ceil(float);
float copysign(float, float);
float cos(float);
float cosh(float);
float erf(float);
float erfc(float);
float exp(float);
float exp2(float);
```

```

float expm1(float);
float fabs(float);
float fdim(float, float);
float floor(float);
float fma(float, float, float);
float fmax(float, float);
float fmin(float, float);
float fmod(float, float);
float frexp(float, int*);
float hypot(float, float);
int ilogb(float);
float ldexp(float, int);
float lgamma(float);
long long llrint(float);
long long llround(float);
float log(float);
float log10(float);
float log1p(float);
float log2(float);
float logb(float);
long lrint(float);
long lround(float);
float modf(float, float*);
float nearbyint(float);
float nextafter(float, float);
float nexttoward(float, long double);
float pow(float, float);
float remainder(float, float);
float remquo(float, float, int *);
float rint(float);
float round(float);
float scalbln(float, long);
float scalbn(float, int);
float sin(float);
float sinh(float);
float sqrt(float);
float tan(float);
float tanh(float);
float tgamma(float);
float trunc(float);

double abs(double);           // fabs()

long double abs(long double);
long double acos(long double);
long double acosh(long double);
long double asin(long double);
long double asinh(long double);
long double atan(long double);
long double atan2(long double, long double);
long double atanh(long double);
long double cbrt(long double);
long double ceil(long double);
long double copysign(long double, long double);
long double cos(long double);

```

```

long double cosh(long double);
long double erf(long double);
long double erfc(long double);
long double exp(long double);
long double exp2(long double);
long double expm1(long double);
long double fabs(long double);
long double fdim(long double, long double);
long double floor(long double);
long double fma(long double, long double, long double);
long double fmax(long double, long double);
long double fmin(long double, long double);
long double fmod(long double, long double);
long double frexp(long double, int*);
long double hypot(long double, long double);
int ilogb(long double);
long double ldexp(long double, int);
long double lgamma(long double);
long long llrint(long double);
long long llround(long double);
long double log(long double);
long double log10(long double);
long double log1p(long double);
long double log2(long double);
long double logb(long double);
long lrint(long double);
long lround(long double);
long double modf(long double, long double*);
long double nearbyint(long double);
long double nextafter(long double, long double);
long double nexttoward(long double, long double);
long double pow(long double, long double);
long double remainder(long double, long double);
long double remquo(long double, long double, int *);
long double rint(long double);
long double round(long double);
long double scalbln(long double, long);
long double scalbn(long double, int);
long double sin(long double);
long double sinh(long double);
long double sqrt(long double);
long double tan(long double);
long double tanh(long double);
long double tgamma(long double);
long double trunc(long double);

```

- <sup>13</sup> C++ adds three-argument versions of certain math functions in `<cmath>`:

```

double hypot(double x, double y, double z);
float hypot(float x, float y, float z);
long double hypot(long double x, long double y, long double z);

```

*Returns:*  $\sqrt{x^2 + y^2 + z^2}$ .

- <sup>14</sup> The classification/comparison functions behave the same as the C macros with the corresponding names defined in 7.12.3, Classification macros, and 7.12.14, Comparison macros in the C Standard. Each function is

overloaded for the three floating-point types, as follows:

```
int fpclassify(float x);
bool isfinite(float x);
bool isinf(float x);
bool isnan(float x);
bool isnormal(float x);
bool signbit(float x);

bool isgreater(float x, float y);
bool isgreaterequal(float x, float y);
bool isless(float x, float y);
bool islessequal(float x, float y);
bool islessgreater(float x, float y);
bool isunordered(float x, float y);

int fpclassify(double x);
bool isfinite(double x);
bool isinf(double x);
bool isnan(double x);
bool isnormal(double x);
bool signbit(double x);

bool isgreater(double x, double y);
bool isgreaterequal(double x, double y);
bool isless(double x, double y);
bool islessequal(double x, double y);
bool islessgreater(double x, double y);
bool isunordered(double x, double y);

int fpclassify(long double x);
bool isfinite(long double x);
bool isinf(long double x);
bool isnan(long double x);
bool isnormal(long double x);
bool signbit(long double x);

bool isgreater(long double x, long double y);
bool isgreaterequal(long double x, long double y);
bool isless(long double x, long double y);
bool islessequal(long double x, long double y);
bool islessgreater(long double x, long double y);
bool isunordered(long double x, long double y);
```

<sup>15</sup> Moreover, there shall be additional overloads sufficient to ensure:

1. If any argument of arithmetic type corresponding to a **double** parameter has type **long double**, then all arguments of arithmetic type (3.9.1) corresponding to **double** parameters are effectively cast to **long double**.
2. Otherwise, if any argument of arithmetic type corresponding to a **double** parameter has type **double** or an integer type, then all arguments of arithmetic type corresponding to **double** parameters are effectively cast to **double**.
3. Otherwise, all arguments of arithmetic type corresponding to **double** parameters have type **float**.

## 26.10 Additions to header <cmath>

[sf.cmath]

- <sup>1</sup> Table 128 summarizes the functions that are added to header <cmath>.

Table 128 — Additions to header <cmath>

| Functions      |              |              |
|----------------|--------------|--------------|
| assoc_laguerre | cyl_bessel_j | hermite      |
| assoc_legendre | cyl_bessel_k | legendre     |
| beta           | cyl_neumann  | laguerre     |
| comp_ellint_1  | ellint_1     | riemann_zeta |
| comp_ellint_2  | ellint_2     | sph_bessel   |
| comp_ellint_3  | ellint_3     | sph_legendre |
| cyl_bessel_i   | expint       | sph_neumann  |

- <sup>2</sup> Each of these functions is provided for arguments of types float, double, and long double. The detailed signatures added to header <cmath> are:

```
namespace std {
    // 26.10.1, associated Laguerre polynomials:
    double      assoc_laguerre(unsigned n, unsigned m, double x);
    float       assoc_laguerref(unsigned n, unsigned m, float x);
    long double assoc_laguerrel(unsigned n, unsigned m, long double x);

    // 26.10.2, associated Legendre polynomials:
    double      assoc_legendre(unsigned l, unsigned m, double x);
    float       assoc_legendref(unsigned l, unsigned m, float x);
    long double assoc_legendrel(unsigned l, unsigned m, long double x);

    // 26.10.3, beta function:
    double      beta(double x, double y);
    float       betaf(float x, float y);
    long double betal(long double x, long double y);

    // 26.10.4, (complete) elliptic integral of the first kind:
    double      comp_ellint_1(double k);
    float       comp_ellint_1f(float k);
    long double comp_ellint_1l(long double k);

    // 26.10.5, (complete) elliptic integral of the second kind:
    double      comp_ellint_2(double k);
    float       comp_ellint_2f(float k);
    long double comp_ellint_2l(long double k);

    // 26.10.6, (complete) elliptic integral of the third kind:
    double      comp_ellint_3(double k, double nu);
    float       comp_ellint_3f(float k, float nu);
    long double comp_ellint_3l(long double k, long double nu);

    // 26.10.7, regular modified cylindrical Bessel functions:
    double      cyl_bessel_i(double nu, double x);
    float       cyl_bessel_if(float nu, float x);
    long double cyl_bessel_il(long double nu, long double x);
}
```

```

// 26.10.8, cylindrical Bessel functions (of the first kind):
double      cyl_bessel_j(double nu, double x);
float       cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);

// 26.10.9, irregular modified cylindrical Bessel functions:
double      cyl_bessel_k(double nu, double x);
float       cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);

// 26.10.10, cylindrical Neumann functions;
// cylindrical Bessel functions (of the second kind):
double      cyl_neumann(double nu, double x);
float       cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);

// 26.10.11, (incomplete) elliptic integral of the first kind:
double      ellint_1(double k, double phi);
float       ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);

// 26.10.12, (incomplete) elliptic integral of the second kind:
double      ellint_2(double k, double phi);
float       ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);

// 26.10.13, (incomplete) elliptic integral of the third kind:
double      ellint_3(double k, double nu, double phi);
float       ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);

// 26.10.14, exponential integral:
double      expint(double x);
float       expintf(float x);
long double expintl(long double x);

// 26.10.15, Hermite polynomials:
double      hermite(unsigned n, double x);
float       hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);

// 26.10.16, Laguerre polynomials:
double      laguerre(unsigned n, double x);
float       laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);

// 26.10.17, Legendre polynomials:
double      legendre(unsigned l, double x);
float       legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);

// 26.10.18, Riemann zeta function:
double      riemann_zeta(double x);
float       riemann_zetaf(float x);

```

```

long double  riemann_zetal(long double x);

// 26.10.19, spherical Bessel functions (of the first kind):
double       sph_bessel(unsigned n, double x);
float        sph_besself(unsigned n, float x);
long double  sph_bessell(unsigned n, long double x);

// 26.10.20, spherical associated Legendre functions:
double       sph_legendre(unsigned l, unsigned m, double theta);
float        sph_legendref(unsigned l, unsigned m, float theta);
long double  sph_legendrel(unsigned l, unsigned m, long double theta);

// 26.10.21, spherical Neumann functions;
// spherical Bessel functions (of the second kind):
double       sph_neumann(unsigned n, double x);
float        sph_neumannf(unsigned n, float x);
long double  sph_neumannl(unsigned n, long double x);
}

```

<sup>3</sup> Moreover, there shall be additional overloads sufficient to ensure:

- (3.1) — If any argument of arithmetic type corresponding to a **double** parameter has type **long double**, then all arguments of arithmetic type (3.9.1) corresponding to **double** parameters are effectively cast to **long double**.
- (3.2) — Otherwise, if any argument of arithmetic type corresponding to a **double** parameter has type **double** or an integer type, then all arguments of arithmetic type corresponding to **double** parameters are effectively cast to **double**.
- (3.3) — Otherwise, all arguments of arithmetic type corresponding to **double** parameters have type **float**.

<sup>4</sup> If any argument value to any of the functions specified above is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

- (4.1) — the function description's *Returns* clause explicitly specifies a domain and those argument values fall outside the specified domain, or
- (4.2) — the corresponding mathematical function value has a non-zero imaginary component, or
- (4.3) — the corresponding mathematical function is not mathematically defined.<sup>294</sup>

<sup>5</sup> Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

### 26.10.1 Associated Laguerre polynomials

[sf.cmath.assoc\_laguerre]

```

double       assoc_laguerre(unsigned n, unsigned m, double x);
float        assoc_laguerref(unsigned n, unsigned m, float x);
long double  assoc_laguerrel(unsigned n, unsigned m, long double x);

```

<sup>1</sup> *Effects:* These functions compute the associated Laguerre polynomials of their respective arguments **n**, **m**, and **x**.

<sup>2</sup> *Returns:*

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0$$

<sup>294</sup> A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

where  $n$  is  $\mathbf{n}$ ,  $m$  is  $\mathbf{m}$ , and  $x$  is  $\mathbf{x}$ .

- 3 *Remark:* The effect of calling each of these functions is implementation-defined if  $\mathbf{n} \geq 128$  or if  $\mathbf{m} \geq 128$ .

### 26.10.2 Associated Legendre polynomials [sf.cmath.assoc\_legendre]

```
double    assoc_legendre(unsigned l, unsigned m, double x);
float     assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

- 1 *Effects:* These functions compute the associated Legendre functions of their respective arguments  $\mathbf{l}$ ,  $\mathbf{m}$ , and  $\mathbf{x}$ .

- 2 *Returns:*

$$P_{\ell}^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_{\ell}(x), \quad \text{for } |x| \leq 1$$

where  $\mathbf{l}$  is  $\mathbf{l}$ ,  $\mathbf{m}$  is  $\mathbf{m}$ , and  $x$  is  $\mathbf{x}$ .

- 3 *Remark:* The effect of calling each of these functions is implementation-defined if  $\mathbf{l} \geq 128$ .

### 26.10.3 Beta function [sf.cmath.beta]

```
double    beta(double x, double y);
float     betaf(float x, float y);
long double betal(long double x, long double y);
```

- 1 *Effects:* These functions compute the beta function of their respective arguments  $\mathbf{x}$  and  $\mathbf{y}$ .

- 2 *Returns:*

$$B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, y > 0$$

where  $x$  is  $\mathbf{x}$  and  $y$  is  $\mathbf{y}$ .

### 26.10.4 (Complete) elliptic integral of the first kind [sf.cmath.comp\_ellint\_1]

```
double    comp_ellint_1(double k);
float     comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

- 1 *Effects:* These functions compute the complete elliptic integral of the first kind of their respective arguments  $\mathbf{k}$ .

- 2 *Returns:*

$$K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1$$

where  $k$  is  $\mathbf{k}$ .

- 3 See also [26.10.11](#).

### 26.10.5 (Complete) elliptic integral of the second kind [sf.cmath.comp\_ellint\_2]

```
double    comp_ellint_2(double k);
float     comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

- 1 *Effects:* These functions compute the complete elliptic integral of the second kind of their respective arguments  $\mathbf{k}$ .

- 2 *Returns:*

$$E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1$$

where  $k$  is  $k$ .

3 See also [26.10.12](#).

### 26.10.6 (Complete) elliptic integral of the third kind [sf.cmath.comp\_ellint\_3]

```
double    comp_ellint_3(double k, double nu);
float     comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1 *Effects:* These functions compute the complete elliptic integral of the third kind of their respective arguments  $k$  and  $nu$ .

2 *Returns:*

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1$$

where  $k$  is  $k$  and  $nu$  is  $nu$ .

3 See also [26.10.13](#).

### 26.10.7 Regular modified cylindrical Bessel functions [sf.cmath.cyl\_bessel]

```
double    cyl_bessel_i(double nu, double x);
float     cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 *Effects:* These functions compute the regular modified cylindrical Bessel functions of their respective arguments  $nu$  and  $x$ .

2 *Returns:*

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0$$

where  $nu$  is  $nu$  and  $x$  is  $x$ .

3 *Remark:* The effect of calling each of these functions is implementation-defined if  $nu \geq 128$ .

4 See also [26.10.8](#).

### 26.10.8 Cylindrical Bessel functions (of the first kind) [sf.cmath.cyl\_bessel\_j]

```
double    cyl_bessel_j(double nu, double x);
float     cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Bessel functions of the first kind of their respective arguments  $nu$  and  $x$ .

2 *Returns:*

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0$$

where  $nu$  is  $nu$  and  $x$  is  $x$ .

3 *Remark:* The effect of calling each of these functions is implementation-defined if  $nu \geq 128$ .

### 26.10.9 Irregular modified cylindrical Bessel functions [sf.cmath.cyl\_bessel\_k]

```
double    cyl_bessel_k(double nu, double x);
float     cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 *Effects:* These functions compute the irregular modified cylindrical Bessel functions of their respective arguments **nu** and **x**.

2 *Returns:*

$$K_{\nu}(x) = (\pi/2)i^{\nu+1}(J_{\nu}(ix) + iN_{\nu}(ix)) = \begin{cases} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_{\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \rightarrow \nu} \frac{I_{-\mu}(x) - I_{\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where *nu* is **nu** and *x* is **x**.

3 *Remark:* The effect of calling each of these functions is implementation-defined if **nu**  $\geq$  128.

4 See also [26.10.7](#).

### 26.10.10 Cylindrical Neumann functions

[sf.cmath.cyl\_neumann]

```
double    cyl_neumann(double nu, double x);
float     cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments **nu** and **x**.

2 *Returns:*

$$N_{\nu}(x) = \begin{cases} \frac{J_{\nu}(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \rightarrow \nu} \frac{J_{\mu}(x) \cos \mu\pi - J_{-\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where *nu* is **nu** and *x* is **x**.

3 *Remark:* The effect of calling each of these functions is implementation-defined if **nu**  $\geq$  128.

4 See also [26.10.8](#).

### 26.10.11 (Incomplete) elliptic integral of the first kind

[sf.cmath.ellint\_1]

```
double    ellint_1(double k, double phi);
float     ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the first kind of their respective arguments **k** and **phi** (**phi** measured in radians).

2 *Returns:*

$$F(k, \phi) = \int_0^{\phi} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1$$

where *k* is **k** and *phi* is **phi**.

### 26.10.12 (Incomplete) elliptic integral of the second kind

[sf.cmath.ellint\_2]

```
double    ellint_2(double k, double phi);
float     ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

<sup>1</sup> *Effects:* These functions compute the incomplete elliptic integral of the second kind of their respective arguments **k** and **phi** (**phi** measured in radians).

<sup>2</sup> *Returns:*

$$E(k, \phi) = \int_0^{\phi} \sqrt{1 - k^2 \sin^2 \theta} d\theta, \quad \text{for } |k| \leq 1$$

where *k* is **k** and *phi* is **phi**.

### 26.10.13 (Incomplete) elliptic integral of the third kind [sf.cmath.ellint\_3]

```
double    ellint_3(double k, double nu, double phi);
float     ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

<sup>1</sup> *Effects:* These functions compute the incomplete elliptic integral of the third kind of their respective arguments **k**, **nu**, and **phi** (**phi** measured in radians).

<sup>2</sup> *Returns:*

$$\Pi(\nu, k, \phi) = \int_0^{\phi} \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1$$

where *nu* is **nu**, *k* is **k**, and *phi* is **phi**.

### 26.10.14 Exponential integral [sf.cmath.expint]

```
double    expint(double x);
float     expintf(float x);
long double expintl(long double x);
```

<sup>1</sup> *Effects:* These functions compute the exponential integral of their respective arguments **x**.

<sup>2</sup> *Returns:*

$$\text{Ei}(x) = - \int_{-x}^{\infty} \frac{e^{-t}}{t} dt$$

where *x* is **x**.

### 26.10.15 Hermite polynomials [sf.cmath.hermite]

```
double    hermite(unsigned n, double x);
float     hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

<sup>1</sup> *Effects:* These functions compute the Hermite polynomials of their respective arguments **n** and **x**.

<sup>2</sup> *Returns:*

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

where *n* is **n** and *x* is **x**.

<sup>3</sup> *Remark:* The effect of calling each of these functions is implementation-defined if **n** >= 128.

### 26.10.16 Laguerre polynomials [sf.cmath.laguerre]

```
double    laguerre(unsigned n, double x);
float     laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1 *Effects:* These functions compute the Laguerre polynomials of their respective arguments **n** and **x**.

2 *Returns:*

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}), \quad \text{for } x \geq 0$$

where  $n$  is **n** and  $x$  is **x**.

3 *Remark:* The effect of calling each of these functions is implementation-defined if **n**  $\geq$  128.

### 26.10.17 Legendre polynomials

[sf.cmath.legendre]

```
double    legendre(unsigned l, double x);
float     legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1 *Effects:* These functions compute the Legendre polynomials of their respective arguments **l** and **x**.

2 *Returns:*

$$P_\ell(x) = \frac{1}{2^\ell \ell!} \frac{d^\ell}{dx^\ell} (x^2 - 1)^\ell, \quad \text{for } |x| \leq 1$$

where  $l$  is **l** and  $x$  is **x**.

3 *Remark:* The effect of calling each of these functions is implementation-defined if **l**  $\geq$  128.

### 26.10.18 Riemann zeta function

[sf.cmath.riemann\_zeta]

```
double    riemann_zeta(double x);
float     riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1 *Effects:* These functions compute the Riemann zeta function of their respective arguments **x**.

2 *Returns:*

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1-2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\ 2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0 \end{cases}$$

where  $x$  is **x**.

### 26.10.19 Spherical Bessel functions (of the first kind)

[sf.cmath.sph\_bessel]

```
double    sph_bessel(unsigned n, double x);
float     sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1 *Effects:* These functions compute the spherical Bessel functions of the first kind of their respective arguments **n** and **x**.

2 *Returns:*

$$j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0$$

where  $n$  is **n** and  $x$  is **x**.

3 *Remark:* The effect of calling each of these functions is implementation-defined if **n**  $\geq$  128.

4 See also [26.10.8](#).

**26.10.20 Spherical associated Legendre functions****[sf.cmath.sph\_legendre]**

```
double    sph_legendre(unsigned l, unsigned m, double theta);
float     sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

<sup>1</sup> *Effects:* These functions compute the spherical associated Legendre functions of their respective arguments `l`, `m`, and `theta` (`theta` measured in radians).

<sup>2</sup> *Returns:*

$$Y_{\ell}^m(\theta, 0)$$

where

$$Y_{\ell}^m(\theta, \phi) = (-1)^m \left[ \frac{(2\ell+1)}{4\pi} \frac{(\ell-m)!}{(\ell+m)!} \right]^{1/2} P_{\ell}^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell$$

and  $\ell$  is `l`,  $m$  is `m`, and  $\theta$  is `theta`.

<sup>3</sup> *Remark:* The effect of calling each of these functions is implementation-defined if `l`  $\geq$  128.

<sup>4</sup> See also [26.10.2](#).

**26.10.21 Spherical Neumann functions****[sf.cmath.sph\_neumann]**

```
double    sph_neumann(unsigned n, double x);
float     sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

<sup>1</sup> *Effects:* These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments `n` and `x`.

<sup>2</sup> *Returns:*

$$n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0$$

where  $n$  is `n` and  $x$  is `x`.

<sup>3</sup> *Remark:* The effect of calling each of these functions is implementation-defined if `n`  $\geq$  128.

<sup>4</sup> See also [26.10.10](#).

## 27 Input/output library [input.output]

### 27.1 General [input.output.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform input/output operations.
- <sup>2</sup> The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 129.

Table 129 — Input/output library summary

| Subclause                                        | Header(s)                                                                                    |
|--------------------------------------------------|----------------------------------------------------------------------------------------------|
| <a href="#">27.2</a> Requirements                |                                                                                              |
| <a href="#">27.3</a> Forward declarations        | <code>&lt;iosfwd&gt;</code>                                                                  |
| <a href="#">27.4</a> Standard iostream objects   | <code>&lt;iostream&gt;</code>                                                                |
| <a href="#">27.5</a> Iostreams base classes      | <code>&lt;ios&gt;</code>                                                                     |
| <a href="#">27.6</a> Stream buffers              | <code>&lt;streambuf&gt;</code>                                                               |
| <a href="#">27.7</a> Formatting and manipulators | <code>&lt;istream&gt;</code><br><code>&lt;ostream&gt;</code><br><code>&lt;iomanip&gt;</code> |
| <a href="#">27.8</a> String streams              | <code>&lt;sstream&gt;</code>                                                                 |
| <a href="#">27.9</a> File streams                | <code>&lt;fstream&gt;</code>                                                                 |
| <a href="#">27.10</a> File systems               | <code>&lt;filesystem&gt;</code>                                                              |
| <a href="#">27.11</a> C library files            | <code>&lt;cstdio&gt;</code><br><code>&lt;cinttypes&gt;</code>                                |

- <sup>3</sup> Figure 7 illustrates relationships among various types described in this clause. A line from **A** to **B** indicates that **A** is an alias (e.g. a typedef) for **B** or that **A** is defined in terms of **B**.

Figure 7 — Stream position, offset, and size types [non-normative]

## 27.2 Iostreams requirements

[iostreams.requirements]

### 27.2.1 Imbue limitations

[iostream.limits.imbue]

- <sup>1</sup> No function described in Clause 27 except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in Clause 27 or as an overriding virtual function of any class declared in Clause 27 calls `imbue`, the behavior is undefined.

### 27.2.2 Positioning type limitations

[iostreams.limits.pos]

- <sup>1</sup> The classes of Clause 27 with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.
- <sup>2</sup> In the classes of Clause 27, a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that satisfy the requirements for a character on which any of the iostream components can be instantiated.

### 27.2.3 Thread safety

[iostreams.threadsafety]

- <sup>1</sup> Concurrent access to a stream object (27.8, 27.9), stream buffer object (27.6), or C Library stream (27.11) by multiple threads may result in a data race (1.10) unless otherwise specified (27.4). [ *Note*: Data races result in undefined behavior (1.10). — *end note* ]
- <sup>2</sup> If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

## 27.3 Forward declarations

[iostream.forward]

### Header <iosfwd> synopsis

```
namespace std {
    template<class charT> class char_traits;
    template<> class char_traits<char>;
    template<> class char_traits<char16_t>;
    template<> class char_traits<char32_t>;
    template<> class char_traits<wchar_t>;

    template<class T> class allocator;

    template <class charT, class traits = char_traits<charT> >
        class basic_ios;
    template <class charT, class traits = char_traits<charT> >
        class basic_streambuf;
    template <class charT, class traits = char_traits<charT> >
        class basic_istream;
    template <class charT, class traits = char_traits<charT> >
        class basic_ostream;
    template <class charT, class traits = char_traits<charT> >
        class basic_iostream;

    template <class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT> >
        class basic_stringbuf;
    template <class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT> >
        class basic_istreamstream;
```

```

template <class charT, class traits = char_traits<charT>,
         class Allocator = allocator<charT> >
    class basic_ostringstream;
template <class charT, class traits = char_traits<charT>,
         class Allocator = allocator<charT> >
    class basic_stringstream;

template <class charT, class traits = char_traits<charT> >
    class basic_filebuf;
template <class charT, class traits = char_traits<charT> >
    class basic_ifstream;
template <class charT, class traits = char_traits<charT> >
    class basic_ofstream;
template <class charT, class traits = char_traits<charT> >
    class basic_fstream;

template <class charT, class traits = char_traits<charT> >
    class istreambuf_iterator;
template <class charT, class traits = char_traits<charT> >
    class ostreambuf_iterator;

typedef basic_ios<char>          ios;
typedef basic_ios<wchar_t>      wios;

typedef basic_streambuf<char>    streambuf;
typedef basic_istream<char>      istream;
typedef basic_ostream<char>      ostream;
typedef basic_iostream<char>     iostream;

typedef basic_stringbuf<char>     stringbuf;
typedef basic_istreamstream<char>  istringstream;
typedef basic_ostreamstream<char>  ostreamstream;
typedef basic_stringstream<char>   stringstream;

typedef basic_filebuf<char>       filebuf;
typedef basic_ifstream<char>      ifstream;
typedef basic_ofstream<char>      ofstream;
typedef basic_fstream<char>       fstream;

typedef basic_streambuf<wchar_t>  wstreambuf;
typedef basic_istream<wchar_t>    wistream;
typedef basic_ostream<wchar_t>    wostream;
typedef basic_iostream<wchar_t>   wiostream;

typedef basic_stringbuf<wchar_t>  wstringbuf;
typedef basic_istreamstream<wchar_t> wistringstream;
typedef basic_ostreamstream<wchar_t> wostringstream;
typedef basic_stringstream<wchar_t> wstringstream;

typedef basic_filebuf<wchar_t>    wfilebuf;
typedef basic_ifstream<wchar_t>    wifstream;
typedef basic_ofstream<wchar_t>    wofstream;
typedef basic_fstream<wchar_t>     wfstream;

template <class state> class fpos;

```

```

    typedef fpos<char_traits<char>::state_type>    streampos;
    typedef fpos<char_traits<wchar_t>::state_type> wstreampos;
}

```

- <sup>1</sup> Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.<sup>295</sup>
- <sup>2</sup> [ *Note:* The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.
- <sup>3</sup> The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf` and `basic_filebuf`.
- <sup>4</sup> The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istreamstream` and `basic_ifstream`.
- <sup>5</sup> The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostreamstream` and `basic_ofstream`.
- <sup>6</sup> The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.
- <sup>7</sup> Other typedefs define instances of class templates specialized for `char` or `wchar_t` types.
- <sup>8</sup> Specializations of the class template `fpos` are used for specifying file position information.
- <sup>9</sup> The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively.
- <sup>10</sup> This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. One way to do this might be

```

template<class stateT> class fpos { ... };           // depends on nothing
typedef ... _STATE;                               // implementation private declaration of stateT

typedef fpos<_STATE> streampos;

template<> struct char_traits<char> {
    typedef streampos
    pos_type;
}

```

— *end note*]

## 27.4 Standard iostream objects

[[iostream.objects](#)]

### 27.4.1 Overview

[[iostream.objects.overview](#)]

#### Header `<iostream>` synopsis

```

#include <ios>
#include <streambuf>
#include <istream>
#include <ostream>

namespace std {
    extern istream cin;

```

---

<sup>295</sup>) It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

```

extern ostream cout;
extern ostream cerr;
extern ostream clog;

extern wistream wcin;
extern wostream wcout;
extern wostream wcerr;
extern wostream wclog;
}

```

- <sup>1</sup> In this Clause, the type name `FILE` refers to the type `FILE` declared in `<stdio>` (27.11).
- <sup>2</sup> The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<stdio>` (27.11), and includes all the headers necessary to use these objects.
- <sup>3</sup> The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` begins execution.<sup>296</sup> The objects are not destroyed during program execution.<sup>297</sup> The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Similarly, the entire program shall behave as if there were at least one instance of `ios_base::Init` with static storage duration.
- <sup>4</sup> Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILE`s, as specified in Amendment 1 of the ISO C standard.
- <sup>5</sup> Concurrent access to a synchronized (27.5.3.4) standard `iostream` object's formatted and unformatted input (27.7.2.1) and output (27.7.3.1) functions or a standard C stream by multiple threads shall not result in a data race (1.10). [*Note: Users must still synchronize concurrent use of these objects and streams by multiple threads if they wish to avoid interleaved characters. — end note*]

## 27.4.2 Narrow stream objects

[`narrow.stream.objects`]

```
istream cin;
```

- <sup>1</sup> The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<stdio>`.
- <sup>2</sup> After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (27.5.5.2).

```
ostream cout;
```

- <sup>3</sup> The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<stdio>` (27.11).

```
ostream cerr;
```

- <sup>4</sup> The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<stdio>` (27.11).
- <sup>5</sup> After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (27.5.5.2).

```
ostream clog;
```

- <sup>6</sup> The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<stdio>` (27.11).

<sup>296</sup> If it is possible for them to do so, implementations are encouraged to initialize the objects earlier than required.

<sup>297</sup> Constructors and destructors for static objects can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

### 27.4.3 Wide stream objects

[wide.stream.objects]

```
wistream wcin;
```

1 The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>`.

2 After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (27.5.5.2).

```
wostream wcout;
```

3 The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (27.11).

```
wostream wcerr;
```

4 The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (27.11).

5 After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (27.5.5.2).

```
wostream wlog;
```

6 The object `wlog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (27.11).

## 27.5 Iostreams base classes

[iostreams.base]

### 27.5.1 Overview

[iostreams.base.overview]

#### Header `<ios>` synopsis

```
#include <iosfwd>

namespace std {
    typedef implementation-defined streamoff;
    typedef implementation-defined streamsize;
    template <class stateT> class fpos;

    class ios_base;
    template <class charT, class traits = char_traits<charT> >
        class basic_ios;

    // 27.5.6, manipulators:
    ios_base& boolalpha (ios_base& str);
    ios_base& noboolalpha(ios_base& str);

    ios_base& showbase (ios_base& str);
    ios_base& noshowbase (ios_base& str);

    ios_base& showpoint (ios_base& str);
    ios_base& noshowpoint(ios_base& str);

    ios_base& showpos (ios_base& str);
    ios_base& noshowpos (ios_base& str);

    ios_base& skipws (ios_base& str);
    ios_base& noskipws (ios_base& str);
}
```

```

ios_base& uppercase (ios_base& str);
ios_base& nouppercase(ios_base& str);

ios_base& unitbuf (ios_base& str);
ios_base& nunitbuf (ios_base& str);

// 27.5.6.2, adjustfield:
ios_base& internal (ios_base& str);
ios_base& left (ios_base& str);
ios_base& right (ios_base& str);

// 27.5.6.3, basefield:
ios_base& dec (ios_base& str);
ios_base& hex (ios_base& str);
ios_base& oct (ios_base& str);

// 27.5.6.4, floatfield:
ios_base& fixed (ios_base& str);
ios_base& scientific (ios_base& str);
ios_base& hexfloat (ios_base& str);
ios_base& defaultfloat(ios_base& str);

// 27.5.6.5, error reporting:
enum class io_errc {
    stream = 1
};

template <> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}

```

## 27.5.2 Types

[stream.types]

```
typedef implementation-defined streamoff;
```

- <sup>1</sup> The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.<sup>298</sup>

```
typedef implementation-defined streamsize;
```

- <sup>2</sup> The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.<sup>299</sup>

## 27.5.3 Class `ios_base`

[ios.base]

```

namespace std {
    class ios_base {
    public:
        class failure; // see below

```

---

<sup>298</sup>) Typically long long.

<sup>299</sup>) `streamsize` is used in most places where ISO C would use `size_t`. Most of the uses of `streamsize` could use `size_t`, except for the `strstreambuf` constructors, which require negative values. It should probably be the signed type corresponding to `size_t` (which is what Posix.2 calls `ssize_t`).

```

// 27.5.3.1.2, fmtflags:
typedef T1 fmtflags;
static constexpr fmtflags boolalpha = unspecified;
static constexpr fmtflags dec = unspecified;
static constexpr fmtflags fixed = unspecified;
static constexpr fmtflags hex = unspecified;
static constexpr fmtflags internal = unspecified;
static constexpr fmtflags left = unspecified;
static constexpr fmtflags oct = unspecified;
static constexpr fmtflags right = unspecified;
static constexpr fmtflags scientific = unspecified;
static constexpr fmtflags showbase = unspecified;
static constexpr fmtflags showpoint = unspecified;
static constexpr fmtflags showpos = unspecified;
static constexpr fmtflags skipws = unspecified;
static constexpr fmtflags unitbuf = unspecified;
static constexpr fmtflags uppercase = unspecified;
static constexpr fmtflags adjustfield = see below;
static constexpr fmtflags basefield = see below;
static constexpr fmtflags floatfield = see below;

// 27.5.3.1.3, iostate:
typedef T2 iostate;
static constexpr iostate badbit = unspecified;
static constexpr iostate eofbit = unspecified;
static constexpr iostate failbit = unspecified;
static constexpr iostate goodbit = see below;

// 27.5.3.1.4, openmode:
typedef T3 openmode;
static constexpr openmode app = unspecified;
static constexpr openmode ate = unspecified;
static constexpr openmode binary = unspecified;
static constexpr openmode in = unspecified;
static constexpr openmode out = unspecified;
static constexpr openmode trunc = unspecified;

// 27.5.3.1.5, seekdir:
typedef T4 seekdir;
static constexpr seekdir beg = unspecified;
static constexpr seekdir cur = unspecified;
static constexpr seekdir end = unspecified;

class Init;

// 27.5.3.2, fmtflags state:
fmtflags flags() const;
fmtflags flags(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);

```

```

    streamsize width() const;
    streamsize width(streamsize wide);

    // 27.5.3.3, locales:
    locale imbue(const locale& loc);
    locale getloc() const;

    // 27.5.3.5, storage:
    static int xalloc();
    long& iword(int index);
    void*& pword(int index);

    // destructor:
    virtual ~ios_base();

    // 27.5.3.6, callbacks:
    enum event { erase_event, imbue_event, copyfmt_event };
    typedef void (*event_callback)(event, ios_base&, int index);
    void register_callback(event_callback fn, int index);

    ios_base(const ios_base&) = delete;
    ios_base& operator=(const ios_base&) = delete;

    static bool sync_with_stdio(bool sync = true);

protected:
    ios_base();

private:
    static int index;    // exposition only
    long* iarray;        // exposition only
    void** parray;       // exposition only
};
}

```

<sup>1</sup> `ios_base` defines several member types:

- (1.1) — a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;
- (1.2) — a class `Init`;
- (1.3) — three bitmask types, `fmtflags`, `iostate`, and `openmode`;
- (1.4) — an enumerated type, `seekdir`.

<sup>2</sup> It maintains several kinds of data:

- (2.1) — state information that reflects the integrity of the stream buffer;
- (2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
- (2.3) — additional information that is stored by the program for its private use.

<sup>3</sup> [ *Note:* For the sake of exposition, the maintained data is presented here as:

- (3.1) — **static int index**, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;
- (3.2) — **long\* iarray**, points to the first element of an arbitrary-length **long** array maintained for the private use of the program;
- (3.3) — **void\*\* parray**, points to the first element of an arbitrary-length pointer array maintained for the private use of the program. — *end note*]

### 27.5.3.1 Types

[ios.types]

#### 27.5.3.1.1 Class **ios\_base::failure**

[ios::failure]

```
namespace std {
    class ios_base::failure : public system_error {
    public:
        explicit failure(const string& msg, const error_code& ec = io_errc::stream);
        explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    };
}
```

- <sup>1</sup> An implementation is permitted to define **ios\_base::failure** as a synonym for a class with equivalent functionality to class **ios\_base::failure** shown in this subclause. [ *Note:* When **ios\_base::failure** is a synonym for another type it shall provide a nested type **failure**, to emulate the injected class name. — *end note* ] The class **failure** defines the base class for the types of all objects thrown as exceptions, by functions in the **iostreams** library, to report errors detected during stream buffer operations.
- <sup>2</sup> When throwing **ios\_base::failure** exceptions, implementations should provide values of **ec** that identify the specific reason for the failure. [ *Note:* Errors arising from the operating system would typically be reported as **system\_category()** errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as **error\_code(io\_errc::stream, iostream\_category())**. — *end note* ]

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

- <sup>3</sup> *Effects:* Constructs an object of class **failure** by constructing the base class with **msg** and **ec**.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

- <sup>4</sup> *Effects:* Constructs an object of class **failure** by constructing the base class with **msg** and **ec**.

#### 27.5.3.1.2 Type **ios\_base::fmtflags**

[ios::fmtflags]

```
typedef T1 fmtflags;
```

- <sup>1</sup> The type **fmtflags** is a bitmask type (17.5.2.1.3). Setting its elements has the effects indicated in Table 130.
- <sup>2</sup> Type **fmtflags** also defines the constants indicated in Table 131.

#### 27.5.3.1.3 Type **ios\_base::iostate**

[ios::iostate]

```
typedef T2 iostate;
```

- <sup>1</sup> The type **iostate** is a bitmask type (17.5.2.1.3) that contains the elements indicated in Table 132.
- <sup>2</sup> Type **iostate** also defines the constant:
  - (2.1) — **goodbit**, the value zero.

Table 130 — `fmtflags` effects

| Element                 | Effect(s) if set                                                                                                                                   |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boolalpha</code>  | insert and extract <code>bool</code> type in alphabetic format                                                                                     |
| <code>dec</code>        | converts integer input or generates integer output in decimal base                                                                                 |
| <code>fixed</code>      | generate floating-point output in fixed-point notation                                                                                             |
| <code>hex</code>        | converts integer input or generates integer output in hexadecimal base                                                                             |
| <code>internal</code>   | adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated |
| <code>left</code>       | adds fill characters on the right (final positions) of certain generated output                                                                    |
| <code>oct</code>        | converts integer input or generates integer output in octal base                                                                                   |
| <code>right</code>      | adds fill characters on the left (initial positions) of certain generated output                                                                   |
| <code>scientific</code> | generates floating-point output in scientific notation                                                                                             |
| <code>showbase</code>   | generates a prefix indicating the numeric base of generated integer output                                                                         |
| <code>showpoint</code>  | generates a decimal-point character unconditionally in generated floating-point output                                                             |
| <code>showpos</code>    | generates a <code>+</code> sign in non-negative generated numeric output                                                                           |
| <code>skipws</code>     | skips leading whitespace before certain input operations                                                                                           |
| <code>unitbuf</code>    | flushes output after each output operation                                                                                                         |
| <code>uppercase</code>  | replaces certain lowercase letters with their uppercase equivalents in generated output                                                            |

Table 131 — `fmtflags` constants

| Constant                 | Allowable values                                               |
|--------------------------|----------------------------------------------------------------|
| <code>adjustfield</code> | <code>left</code>   <code>right</code>   <code>internal</code> |
| <code>basefield</code>   | <code>dec</code>   <code>oct</code>   <code>hex</code>         |
| <code>floatfield</code>  | <code>scientific</code>   <code>fixed</code>                   |

Table 132 — `iostate` effects

| Element              | Effect(s) if set                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>badbit</code>  | indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);                                  |
| <code>eofbit</code>  | indicates that an input operation reached the end of an input sequence;                                                                          |
| <code>failbit</code> | indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters. |

**27.5.3.1.4 Type `ios_base::openmode`****[`ios::openmode`]**

```
typedef T3 openmode;
```

- <sup>1</sup> The type `openmode` is a bitmask type (17.5.2.1.3). It contains the elements indicated in Table 133.

Table 133 — `openmode` effects

| Element             | Effect(s) if set                                                  |
|---------------------|-------------------------------------------------------------------|
| <code>app</code>    | seek to end before each write                                     |
| <code>ate</code>    | open and seek to end immediately after opening                    |
| <code>binary</code> | perform input and output in binary mode (as opposed to text mode) |
| <code>in</code>     | open for input                                                    |
| <code>out</code>    | open for output                                                   |
| <code>trunc</code>  | truncate an existing stream when opening                          |

**27.5.3.1.5 Type `ios_base::seekdir`****[`ios::seekdir`]**

```
typedef T4 seekdir;
```

- <sup>1</sup> The type `seekdir` is an enumerated type (17.5.2.1.2) that contains the elements indicated in Table 134.

Table 134 — `seekdir` effects

| Element          | Meaning                                                                                 |
|------------------|-----------------------------------------------------------------------------------------|
| <code>beg</code> | request a seek (for subsequent input or output) relative to the beginning of the stream |
| <code>cur</code> | request a seek relative to the current position within the sequence                     |
| <code>end</code> | request a seek relative to the current end of the sequence                              |

**27.5.3.1.6 Class `ios_base::Init`****[`ios::Init`]**

```
namespace std {
    class ios_base::Init {
    public:
        Init();
        ~Init();
    private:
        static int init_cnt; // exposition only
    };
}
```

- <sup>1</sup> The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (27.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (27.11).
- <sup>2</sup> For the sake of exposition, the maintained data is presented here as:
- (2.1) — `static int init_cnt`, counts the number of constructor and destructor calls for class `Init`, initialized to zero.

```
Init();
```

- <sup>3</sup> *Effects:* Constructs an object of class `Init`. Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

~Init();

- 4     *Effects:* Destroys an object of class `Init`. If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

### 27.5.3.2 ios\_base state functions

[fmtflags.state]

fmtflags flags() const;

- 1     *Returns:* The format control information for both input and output.

fmtflags flags(fmtflags fmtfl);

- 2     *Postcondition:* `fmtfl == flags()`.

- 3     *Returns:* The previous value of `flags()`.

fmtflags setf(fmtflags fmtfl);

- 4     *Effects:* Sets `fmtfl` in `flags()`.

- 5     *Returns:* The previous value of `flags()`.

fmtflags setf(fmtflags fmtfl, fmtflags mask);

- 6     *Effects:* Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

- 7     *Returns:* The previous value of `flags()`.

void unsetf(fmtflags mask);

- 8     *Effects:* Clears `mask` in `flags()`.

streamsize precision() const;

- 9     *Returns:* The precision to generate on certain output conversions.

streamsize precision(streamsize prec);

- 10    *Postcondition:* `prec == precision()`.

- 11    *Returns:* The previous value of `precision()`.

streamsize width() const;

- 12    *Returns:* The minimum field width (number of characters) to generate on certain output conversions.

streamsize width(streamsize wide);

- 13    *Postcondition:* `wide == width()`.

- 14    *Returns:* The previous value of `width()`.

### 27.5.3.3 ios\_base functions

[ios.base.locales]

locale imbue(const locale& loc);

- 1     *Effects:* Calls each registered callback pair `(fn, index)` (27.5.3.6) as `(*fn)(imbue_event, *this, index)` at such a time that a call to `ios_base::getloc()` from within `fn` returns the new locale value `loc`.

- 2     *Returns:* The previous value of `getloc()`.

- 3     *Postcondition:* `loc == getloc()`.

locale getloc() const;

- 4     *Returns:* If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

27.5.3.4 `ios_base` static members

[ios.members.static]

```
bool sync_with_stdio(bool sync = true);
```

- 1 *Returns:* **true** if the previous state of the standard iostream objects (27.4) was synchronized and otherwise returns **false**. The first time it is called, the function returns **true**.
- 2 *Effects:* If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a false argument, it allows the standard streams to operate independently of the standard C streams.
- 3 When a standard iostream object `str` is *synchronized* with a standard stdio stream `f`, the effect of inserting a character `c` by
- ```
fputc(f, c);
```
- is the same as the effect of
- ```
str.rdbuf()->sputc(c);
```
- for any sequences of characters; the effect of extracting a character `c` by
- ```
c = fgetc(f);
```
- is the same as the effect of
- ```
c = str.rdbuf()->sbumpc();
```
- for any sequences of characters; and the effect of pushing back a character `c` by
- ```
ungetc(c, f);
```
- is the same as the effect of
- ```
str.rdbuf()->sputbackc(c);
```
- for any sequence of characters.<sup>300</sup>

27.5.3.5 `ios_base` storage functions

[ios.base.storage]

```
static int xalloc();
```

- 1 *Returns:* `index++`.
- 2 *Remarks:* Concurrent access to this function by multiple threads shall not result in a data race (1.10).
- ```
long& iword(int idx);
```
- 3 *Effects:* If `iarray` is a null pointer, allocates an array of `long` of unspecified size and stores a pointer to its first element in `iarray`. The function then extends the array pointed at by `iarray` as necessary to include the element `iarray[idx]`. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operations on the object.<sup>301</sup> However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `iword` with the same index yields another reference to the same value. If the function fails<sup>302</sup> and `*this` is a base subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).
- 4 *Returns:* On success `iarray[idx]`. On failure, a valid `long&` initialized to 0.

300) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

301) An implementation is free to implement both the integer array pointed at by `iarray` and the pointer array pointed at by `parray` as sparse data structures, possibly with a one-element cache for each.

302) for example, because it cannot allocate space.

```
void*& pword(int idx);
```

- 5 *Effects:* If `parray` is a null pointer, allocates an array of pointers to `void` of unspecified size and stores a pointer to its first element in `parray`. The function then extends the array pointed at by `parray` as necessary to include the element `parray[idx]`. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `pword` with the same index yields another reference to the same value. If the function fails<sup>303</sup> and `*this` is a base subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).
- 6 *Returns:* On success `parray[idx]`. On failure a valid `void*&` initialized to 0.
- 7 *Remarks:* After a subsequent call to `pword(int)` for the same object, the earlier return value may no longer be valid.

### 27.5.3.6 ios\_base callbacks

[ios.base.callback]

```
void register_callback(event_callback fn, int index);
```

- 1 *Effects:* Registers the pair `(fn, index)` such that during calls to `imbue()` (27.5.3.3), `copyfmt()`, or `~ios_base()` (27.5.3.7), the function `fn` is called with argument `index`. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.
- 2 *Requires:* The function `fn` shall not throw exceptions.
- Remarks:* Identical pairs are not merged. A function registered twice will be called twice.

### 27.5.3.7 ios\_base constructors/destructor

[ios.base.cons]

```
ios_base();
```

- 1 *Effects:* Each `ios_base` member has an indeterminate value after construction. The object's members shall be initialized by calling `basic_ios::init` before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~ios_base();
```

- 2 *Effects:* Destroys an object of class `ios_base`. Calls each registered callback pair `(fn, index)` (27.5.3.6) as `(*fn)(erase_event, *this, index)` at such time that any `ios_base` member function called from within `fn` has well defined results.

## 27.5.4 Class template fpos

[fpos]

```
namespace std {
    template <class stateT> class fpos {
    public:
        // 27.5.4.1, members:
        stateT state() const;
        void state(stateT);
    private:
        stateT st; // exposition only
    };
}
```

### 27.5.4.1 fpos members

[fpos.members]

---

303) for example, because it cannot allocate space.

```
void state(stateT s);
```

<sup>1</sup> *Effects:* Assigns **s** to **st**.

```
stateT state() const;
```

<sup>2</sup> *Returns:* Current value of **st**.

#### 27.5.4.2 fpos requirements

[fpos.operations]

<sup>1</sup> Operations specified in Table 135 are permitted. In that table,

- (1.1) — **P** refers to an instance of **fpos**,
- (1.2) — **p** and **q** refer to values of type **P**,
- (1.3) — **0** refers to type **streamoff**,
- (1.4) — **o** refers to a value of type **streamoff**,
- (1.5) — **sz** refers to a value of type **streamsize** and
- (1.6) — **i** refers to a value of type **int**.

Table 135 — Position type requirements

| Expression                        | Return type                | Operational semantics | Assertion/note pre-/post-condition                 |
|-----------------------------------|----------------------------|-----------------------|----------------------------------------------------|
| <b>P(i)</b>                       |                            |                       | <b>p == P(i)</b><br>note: a destructor is assumed. |
| <b>P p(i);</b><br><b>P p = i;</b> |                            |                       | post: <b>p == P(i)</b> .                           |
| <b>P(o)</b>                       | <b>fpos</b>                | converts from offset  |                                                    |
| <b>0(p)</b>                       | <b>streamoff</b>           | converts to offset    | <b>P(0(p)) == p</b>                                |
| <b>p == q</b>                     | convertible to <b>bool</b> |                       | <b>==</b> is an equivalence relation               |
| <b>p != q</b>                     | convertible to <b>bool</b> | <b>!(p == q)</b>      |                                                    |
| <b>q = p + o</b><br><b>p += o</b> | <b>fpos</b>                | <b>+ offset</b>       | <b>q - o == p</b>                                  |
| <b>q = p - o</b><br><b>p -= o</b> | <b>fpos</b>                | <b>- offset</b>       | <b>q + o == p</b>                                  |
| <b>o = p - q</b>                  | <b>streamoff</b>           | distance              | <b>q + o == p</b>                                  |
| <b>streamsize(o)</b>              | <b>streamsize</b>          | converts              | <b>streamsize(0(sz)) == sz</b>                     |
| <b>0(sz)</b>                      | <b>streamoff</b>           | converts              | <b>streamsize(0(sz)) == sz</b>                     |

<sup>2</sup> [Note: Every implementation is required to supply overloaded operators on **fpos** objects to satisfy the requirements of 27.5.4.2. It is unspecified whether these operators are members of **fpos**, global operators, or provided in some other way. — end note]

<sup>3</sup> Stream operations that return a value of type **traits::pos\_type** return **P(0(-1))** as an invalid value to signal an error. If this value is used as an argument to any **istream**, **ostream**, or **streambuf** member that accepts a value of type **traits::pos\_type** then the behavior of that function is undefined.

### 27.5.5 Class template **basic\_ios**

[ios]

#### 27.5.5.1 Overview

[ios.overview]

##### § 27.5.5.1

```

namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_ios : public ios_base {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;

        // 27.5.5.4, flags functions:
        explicit operator bool() const;
        bool operator!() const;
        iostate rdstate() const;
        void clear(iostate state = goodbit);
        void setstate(iostate state);
        bool good() const;
        bool eof() const;
        bool fail() const;
        bool bad() const;

        iostate exceptions() const;
        void exceptions(iostate except);

        // 27.5.5.2, constructor/destructor:
        explicit basic_ios(basic_streambuf<charT, traits>* sb);
        virtual ~basic_ios();

        // 27.5.5.3, members:
        basic_ostream<charT, traits>* tie() const;
        basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

        basic_streambuf<charT, traits>* rdbuf() const;
        basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

        basic_ios& copyfmt(const basic_ios& rhs);

        char_type fill() const;
        char_type fill(char_type ch);

        locale imbue(const locale& loc);

        char narrow(char_type c, char dfault) const;
        char_type widen(char c) const;

        basic_ios(const basic_ios&) = delete;
        basic_ios& operator=(const basic_ios&) = delete;

    protected:
        basic_ios();
        void init(basic_streambuf<charT, traits>* sb);
        void move(basic_ios& rhs);
        void move(basic_ios&& rhs);
        void swap(basic_ios& rhs) noexcept;
        void set_rdbuf(basic_streambuf<charT, traits>* sb);

```

```
};
}
```

### 27.5.5.2 basic\_ios constructors

[basic.ios.cons]

```
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_ios`, assigning initial values to its member objects by calling `init(sb)`.

```
basic_ios();
```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_ios` (27.5.3.7) leaving its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

- <sup>3</sup> *Remarks:* The destructor does not destroy `rdbuf()`.

```
void init(basic_streambuf<charT, traits>* sb);
```

*Postconditions:* The postconditions of this function are indicated in Table 136.

Table 136 — `basic_ios::init()` effects

| Element                   | Value                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------|
| <code>rdbuf()</code>      | <code>sb</code>                                                                                |
| <code>tie()</code>        | <code>0</code>                                                                                 |
| <code>rdstate()</code>    | <code>goodbit</code> if <code>sb</code> is not a null pointer, otherwise <code>badbit</code> . |
| <code>exceptions()</code> | <code>goodbit</code>                                                                           |
| <code>flags()</code>      | <code>skipws   dec</code>                                                                      |
| <code>width()</code>      | <code>0</code>                                                                                 |
| <code>precision()</code>  | <code>6</code>                                                                                 |
| <code>fill()</code>       | <code>widen(' ');</code>                                                                       |
| <code>getloc()</code>     | a copy of the value returned by <code>locale()</code>                                          |
| <i>iarray</i>             | a null pointer                                                                                 |
| <i>parray</i>             | a null pointer                                                                                 |

### 27.5.5.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

- <sup>1</sup> *Returns:* An output sequence that is *tied* to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

- <sup>2</sup> *Requires:* If `tiestr` is not null, `tiestr` must not be reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

- <sup>3</sup> *Postcondition:* `tiestr == tie()`.

- <sup>4</sup> *Returns:* The previous value of `tie()`.

```
basic_streambuf<charT, traits>* rdbuf() const;
```

5 *Returns:* A pointer to the `streambuf` associated with the stream.

```
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
```

6 *Postcondition:* `sb == rdbuf()`.

7 *Effects:* Calls `clear()`.

8 *Returns:* The previous value of `rdbuf()`.

```
locale imbue(const locale& loc);
```

9 *Effects:* Calls `ios_base::imbue(loc)` (27.5.3.3) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` (27.6.3.2.1).

10 *Returns:* The prior value of `ios_base::imbue()`.

```
char narrow(char_type c, char dfault) const;
```

11 *Returns:* `use_facet< ctype<char_type> >(getloc()).narrow(c, dfault)`

```
char_type widen(char c) const;
```

12 *Returns:* `use_facet< ctype<char_type> >(getloc()).widen(c)`

```
char_type fill() const;
```

13 *Returns:* The character used to pad (fill) an output conversion to the specified field width.

```
char_type fill(char_type fillch);
```

14 *Postcondition:* `traits::eq(fillch, fill())`

15 *Returns:* The previous value of `fill()`.

```
basic_ios& copyfmt(const basic_ios& rhs);
```

16 *Effects:* If `(this == &rhs)` does nothing. Otherwise assigns to the member objects of `*this` the corresponding member objects of `rhs` as follows:

1. calls each registered callback pair `(fn, index)` as `(*fn)(erase_event, *this, index)`;
2. assigns to the member objects of `*this` the corresponding member objects of `rhs`, except that

(16.1) — `rdstate()`, `rdbuf()`, and `exceptions()` are left unchanged;

(16.2) — the contents of arrays pointed at by `pword` and `iword` are copied, not the pointers themselves;<sup>304</sup> and

(16.3) — if any newly stored pointer values in `*this` point at objects stored outside the object `rhs` and those objects are destroyed when `rhs` is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;

3. calls each callback pair that was copied from `rhs` as `(*fn)(copyfmt_event, *this, index)`;
4. calls `exceptions(rhs.exceptions())`.

17 *Note:* The second pass through the callback pairs permits a copied `pword` value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken.

18 *Postconditions:* The postconditions of this function are indicated in Table 137.

19 *Returns:* `*this`.

---

304) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is non-zero.

Table 137 — `basic_ios::copyfmt()` effects

| Element                   | Value                         |
|---------------------------|-------------------------------|
| <code>rdbuf()</code>      | <i>unchanged</i>              |
| <code>tie()</code>        | <code>rhs.tie()</code>        |
| <code>rdstate()</code>    | <i>unchanged</i>              |
| <code>exceptions()</code> | <code>rhs.exceptions()</code> |
| <code>flags()</code>      | <code>rhs.flags()</code>      |
| <code>width()</code>      | <code>rhs.width()</code>      |
| <code>precision()</code>  | <code>rhs.precision()</code>  |
| <code>fill()</code>       | <code>rhs.fill()</code>       |
| <code>getloc()</code>     | <code>rhs.getloc()</code>     |

```
void move(basic_ios& rhs);
void move(basic_ios&& rhs);
```

20 *Postconditions:* `*this` shall have the state that `rhs` had before the function call, except that `rdbuf()` shall return 0. `rhs` shall be in a valid but unspecified state, except that `rhs.rdbuf()` shall return the same value as it returned before the function call, and `rhs.tie()` shall return 0.

```
void swap(basic_ios& rhs) noexcept;
```

21 *Effects:* The states of `*this` and `rhs` shall be exchanged, except that `rdbuf()` shall return the same value as it returned before the function call, and `rhs.rdbuf()` shall return the same value as it returned before the function call.

```
void set_rdbuf(basic_streambuf<charT, traits>* sb);
```

22 *Requires:* `sb != nullptr`.

23 *Effects:* Associates the `basic_streambuf` object pointed to by `sb` with this stream without calling `clear()`.

24 *Postconditions:* `rdbuf() == sb`.

25 *Throws:* Nothing.

#### 27.5.5.4 `basic_ios` flags functions [`iosstate.flags`]

```
explicit operator bool() const;
```

1 *Returns:* `!fail()`.

```
bool operator!() const;
```

2 *Returns:* `fail()`.

```
iosstate rdstate() const;
```

3 *Returns:* The error state of the stream buffer.

```
void clear(iosstate state = goodbit);
```

4 *Postcondition:* If `rdbuf() != 0` then `state == rdstate()`; otherwise `rdstate() == (state | ios_base::badbit)`.

5 *Effects:* If `((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0`, returns. Otherwise, the function throws an object `fail` of class `basic_ios::failure` (27.5.3.1.1), constructed with implementation-defined argument values.

```

void setstate(iostate state);
6      Effects: Calls clear(rdstate() | state) (which may throw basic_ios::failure (27.5.3.1.1)).

bool good() const;
7      Returns: rdstate() == 0

bool eof() const;
8      Returns: true if eofbit is set in rdstate().

bool fail() const;
9      Returns: true if failbit or badbit is set in rdstate().305

bool bad() const;
10     Returns: true if badbit is set in rdstate().

iostate exceptions() const;
11     Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

void exceptions(iostate except);
12     Postcondition: except == exceptions().
13     Effects: Calls clear(rdstate()).

```

## 27.5.6 ios\_base manipulators

[std.ios.manip]

### 27.5.6.1 fmtflags manipulators

[fmtflags.manip]

```

ios_base& boolalpha(ios_base& str);
1      Effects: Calls str.setf(ios_base::boolalpha).
2      Returns: str.

ios_base& noboolalpha(ios_base& str);
3      Effects: Calls str.unsetf(ios_base::boolalpha).
4      Returns: str.

ios_base& showbase(ios_base& str);
5      Effects: Calls str.setf(ios_base::showbase).
6      Returns: str.

ios_base& noshowbase(ios_base& str);
7      Effects: Calls str.unsetf(ios_base::showbase).
8      Returns: str.

ios_base& showpoint(ios_base& str);
9      Effects: Calls str.setf(ios_base::showpoint).
10     Returns: str.

```

---

305) Checking `badbit` also for `fail()` is historical practice.

```

ios_base& noshowpoint(ios_base& str);
11     Effects: Calls str.unsetf(ios_base::showpoint).
12     Returns: str.

ios_base& showpos(ios_base& str);
13     Effects: Calls str.setf(ios_base::showpos).
14     Returns: str.

ios_base& noshowpos(ios_base& str);
15     Effects: Calls str.unsetf(ios_base::showpos).
16     Returns: str.

ios_base& skipws(ios_base& str);
17     Effects: Calls str.setf(ios_base::skipws).
18     Returns: str.

ios_base& noskipws(ios_base& str);
19     Effects: Calls str.unsetf(ios_base::skipws).
20     Returns: str.

ios_base& uppercase(ios_base& str);
21     Effects: Calls str.setf(ios_base::uppercase).
22     Returns: str.

ios_base& nouppercase(ios_base& str);
23     Effects: Calls str.unsetf(ios_base::uppercase).
24     Returns: str.

ios_base& unitbuf(ios_base& str);
25     Effects: Calls str.setf(ios_base::unitbuf).
26     Returns: str.

ios_base& nouunitbuf(ios_base& str);
27     Effects: Calls str.unsetf(ios_base::unitbuf).
28     Returns: str.

```

### 27.5.6.2 adjustfield manipulators

[adjustfield.manip]

```

ios_base& internal(ios_base& str);
1     Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
2     Returns: str.

ios_base& left(ios_base& str);
3     Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
4     Returns: str.

ios_base& right(ios_base& str);
5     Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
6     Returns: str.

```

**27.5.6.3 basefield manipulators****[basefield.manip]**

```
ios_base& dec(ios_base& str);
```

1     *Effects:* Calls `str.setf(ios_base::dec, ios_base::basefield)`.

2     *Returns:* `str`<sup>306</sup>.

```
ios_base& hex(ios_base& str);
```

3     *Effects:* Calls `str.setf(ios_base::hex, ios_base::basefield)`.

4     *Returns:* `str`.

```
ios_base& oct(ios_base& str);
```

5     *Effects:* Calls `str.setf(ios_base::oct, ios_base::basefield)`.

6     *Returns:* `str`.

**27.5.6.4 floatfield manipulators****[floatfield.manip]**

```
ios_base& fixed(ios_base& str);
```

1     *Effects:* Calls `str.setf(ios_base::fixed, ios_base::floatfield)`.

2     *Returns:* `str`.

```
ios_base& scientific(ios_base& str);
```

3     *Effects:* Calls `str.setf(ios_base::scientific, ios_base::floatfield)`.

4     *Returns:* `str`.

```
ios_base& hexfloat(ios_base& str);
```

5     *Effects:* Calls `str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield)`.

6     *Returns:* `str`.

7     [ *Note:* The more obvious use of `ios_base::hex` to specify hexadecimal floating-point format would change the meaning of existing well defined programs. C++ 2003 gives no meaning to the combination of `fixed` and `scientific`. — *end note* ]

```
ios_base& defaultfloat(ios_base& str);
```

8     *Effects:* Calls `str.unsetf(ios_base::floatfield)`.

9     *Returns:* `str`.

**27.5.6.5 Error reporting****[error.reporting]**

```
error_code make_error_code(io_errc e) noexcept;
```

1     *Returns:* `error_code(static_cast<int>(e), iostream_category())`.

```
error_condition make_error_condition(io_errc e) noexcept;
```

2     *Returns:* `error_condition(static_cast<int>(e), iostream_category())`.

```
const error_category& iostream_category() noexcept;
```

3     *Returns:* A reference to an object of a type derived from class `error_category`.

4     The object's `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function shall return a pointer to the string `"iostream"`.

---

306) The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout <<dec` to change the format flags stored in `cout`.

## 27.6 Stream buffers

[stream.buffers]

### 27.6.1 Overview

[stream.buffers.overview]

#### Header <streambuf> synopsis

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
        class basic_streambuf;
    typedef basic_streambuf<char>          streambuf;
    typedef basic_streambuf<wchar_t> wstreambuf;
}
```

- <sup>1</sup> The header <streambuf> defines types that control input from and output to *character* sequences.

### 27.6.2 Stream buffer requirements

[streambuf.reqts]

- <sup>1</sup> Stream buffers can impose various constraints on the sequences they control. Some constraints are:

- (1.1) — The controlled input sequence can be not readable.
- (1.2) — The controlled output sequence can be not writable.
- (1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
- (1.4) — The controlled sequences can support operations *directly* to or from associated sequences.
- (1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

- <sup>2</sup> Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

- (2.1) — the *beginning pointer*, or lowest element address in the array (called `xbeg` here);
- (2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);
- (2.3) — the *end pointer*, or first element address beyond the end of the array (called `xend` here).

- <sup>3</sup> The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

- (3.1) — If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.
- (3.2) — If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
- (3.3) — If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.

- (3.4) — If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 27.6.3 Class template `basic_streambuf`

[streambuf]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_streambuf {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;

        virtual ~basic_streambuf();

        // 27.6.3.2.1, locales:
        locale pubimbue(const locale& loc);
        locale getloc() const;

        // 27.6.3.2.2, buffer and positioning:
        basic_streambuf* pubsetbuf(char_type* s, streamsize n);
        pos_type pubseekoff(off_type off, ios_base::seekdir way,
                           ios_base::openmode which
                           = ios_base::in | ios_base::out);
        pos_type pubseekpos(pos_type sp,
                           ios_base::openmode which
                           = ios_base::in | ios_base::out);
        int pubsync();

        // Get and put areas

virtual streamsize xspn(const char_type* s, streamsize n);
virtual int_type   overflow(int_type c = traits::eof());
};
}

```

- <sup>1</sup> The class template `basic_streambuf` serves as an abstract base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- (1.1) — a character *input sequence*;
- (1.2) — a character *output sequence*.

### 27.6.3.1 `basic_streambuf` constructors

[streambuf.cons]

```
basic_streambuf();
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_streambuf<charT, traits>` and initializes:<sup>307</sup>

307) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class may be constructed.

- (1.1) — all its pointer member objects to null pointers,
- (1.2) — the `getloc()` member to a copy the global locale, `locale()`, at the time of construction.

2 *Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

`basic_streambuf(const basic_streambuf& rhs);`

3 *Effects:* Constructs a copy of `rhs`.

4 *Postconditions:*

- (4.1) — `eback() == rhs.eback()`
- (4.2) — `gptr() == rhs.gptr()`
- (4.3) — `egptr() == rhs.egptr()`
- (4.4) — `pbase() == rhs.pbase()`
- (4.5) — `pptr() == rhs.pptr()`
- (4.6) — `epptr() == rhs.epptr()`
- (4.7) — `getloc() == rhs.getloc()`

`~basic_streambuf();`

5 *Effects:* None.

### 27.6.3.2 `basic_streambuf` public member functions

[streambuf.members]

#### 27.6.3.2.1 Locales

[streambuf.locales]

`locale pubimbue(const locale& loc);`

1 *Postcondition:* `loc == getloc()`.

2 *Effects:* Calls `imbue(loc)`.

3 *Returns:* Previous value of `getloc()`.

`locale getloc() const;`

4 *Returns:* If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

#### 27.6.3.2.2 Buffer management and positioning

[streambuf.buffer]

`basic_streambuf* pubsetbuf(char_type* s, streamsize n);`

1 *Returns:* `setbuf(s, n)`.

`pos_type pubseekoff(off_type off, ios_base::seekdir way,  
ios_base::openmode which  
= ios_base::in | ios_base::out);`

2 *Returns:* `seekoff(off, way, which)`.

`pos_type pubseekpos(pos_type sp,  
ios_base::openmode which  
= ios_base::in | ios_base::out);`

3 *Returns:* `seekpos(sp, which)`.

`int pubsync();`

4 *Returns:* `sync()`.

**27.6.3.2.3 Get area****[streambuf.pub.get]**

streamsize in\_avail();

- 1 *Returns:* If a read position is available, returns `egptr() - gptr()`. Otherwise returns `showmanyc()` (27.6.3.4.3).

int\_type snextc();

- 2 *Effects:* Calls `sbumpc()`.

- 3 *Returns:* If that function returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns `sgetc()`.

int\_type sbumpc();

- 4 *Returns:* If the input sequence read position is not available, returns `uflow()`. Otherwise, returns `traits::to_int_type(*gptr())` and increments the next pointer for the input sequence.

int\_type sgetc();

- 5 *Returns:* If the input sequence read position is not available, returns `underflow()`. Otherwise, returns `traits::to_int_type(*gptr())`.

streamsize sgetn(char\_type\* s, streamsize n);

- 6 *Returns:* `xsgetn(s, n)`.

**27.6.3.2.4 Putback****[streambuf.pub.putback]**

int\_type sputbackc(char\_type c);

- 1 *Returns:* If the input sequence putback position is not available, or if `traits::eq(c, gptr()[-1])` is false, returns `pbackfail(traits::to_int_type(c))`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

int\_type sungetc();

- 2 *Returns:* If the input sequence putback position is not available, returns `pbackfail()`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

**27.6.3.2.5 Put area****[streambuf.pub.put]**

int\_type sputc(char\_type c);

- 1 *Returns:* If the output sequence write position is not available, returns `overflow(traits::to_int_type(c))`. Otherwise, stores `c` at the next pointer for the output sequence, increments the pointer, and returns `traits::to_int_type(c)`.

streamsize sputn(const char\_type\* s, streamsize n);

- 2 *Returns:* `xspn(s, n)`.

**27.6.3.3 basic\_streambuf protected member functions****[streambuf.protected]****27.6.3.3.1 Assignment****[streambuf.assign]**

basic\_streambuf&amp; operator=(const basic\_streambuf&amp; rhs);

- 1 *Effects:* Assigns the data members of `rhs` to `*this`.

- 2 *Postconditions:*

- (2.1) — `eback() == rhs.eback()`

(2.2) — `gptr() == rhs.gptr()`  
 (2.3) — `egptr() == rhs.egptr()`  
 (2.4) — `pbase() == rhs.pbase()`  
 (2.5) — `pptr() == rhs.pptr()`  
 (2.6) — `epptr() == rhs.epptr()`  
 (2.7) — `getloc() == rhs.getloc()`  
 3 *Returns: \*this.*

`void swap(basic_streambuf& rhs);`

4 *Effects:* Swaps the data members of `rhs` and `*this`.

#### 27.6.3.3.2 Get area access

[`streambuf.get.area`]

`char_type* eback() const;`

1 *Returns:* The beginning pointer for the input sequence.

`char_type* gptr() const;`

2 *Returns:* The next pointer for the input sequence.

`char_type* egptr() const;`

3 *Returns:* The end pointer for the input sequence.

`void gbump(int n);`

4 *Effects:* Adds `n` to the next pointer for the input sequence.

`void setg(char_type* gbeg, char_type* gnext, char_type* gend);`

5 *Postconditions:* `gbeg == eback()`, `gnext == gptr()`, and `gend == egptr()`.

#### 27.6.3.3.3 Put area access

[`streambuf.put.area`]

`char_type* pbase() const;`

1 *Returns:* The beginning pointer for the output sequence.

`char_type* pptr() const;`

2 *Returns:* The next pointer for the output sequence.

`char_type* ep_ptr() const;`

3 *Returns:* The end pointer for the output sequence.

`void pbump(int n);`

4 *Effects:* Adds `n` to the next pointer for the output sequence.

`void setp(char_type* pbeg, char_type* pend);`

5 *Postconditions:* `pbeg == pbase()`, `pbeg == pptr()`, and `pend == ep_ptr()`.

**27.6.3.4 basic\_streambuf virtual functions****[streambuf.virtuals]****27.6.3.4.1 Locales****[streambuf.virt.locales]**

```
void imbue(const locale&);
```

1 *Effects:* Change any translations based on locale.

2 *Remarks:* Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from `streambuf` can safely cache results of calls to locale functions and to members of facets so obtained.

3 *Default behavior:* Does nothing.

**27.6.3.4.2 Buffer management and positioning****[streambuf.virt.buffer]**

```
basic_streambuf* setbuf(char_type* s, streamsize n);
```

1 *Effects:* Influences stream buffering in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (27.8.2.4, 27.9.2.4).

2 *Default behavior:* Does nothing. Returns `this`.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

3 *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (27.8.2.4, 27.9.2.4).

4 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

5 *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (27.8.2, 27.9.2).

6 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
int sync();
```

7 *Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8 *Returns:* -1 on failure. What constitutes failure is determined by each derived class (27.9.2.4).

9 *Default behavior:* Returns zero.

**27.6.3.4.3 Get area****[streambuf.virt.get]**

```
streamsize showmanyc();308
```

1 *Returns:* An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.<sup>309</sup>

308) The morphemes of `showmanyc` are “es-how-many-see”, not “show-manic”.

309) `underflow` or `uflow` might fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately.”

2 *Default behavior:* Returns zero.

3 *Remarks:* Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

4 *Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

5 *Returns:* The number of characters assigned.<sup>310</sup>

6 *Remarks:* Uses `traits::eof()`.

```
int_type underflow();
```

7 *Remarks:* The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`

8 *Returns:* `traits::to_int_type(c)`, where `c` is the first *character* of the *pending sequence*, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

9 The *pending sequence* of characters is defined as the concatenation of:

- a) If `gptr()` is non-null, then the `egptr() - gptr()` characters starting at `gptr()`, otherwise the empty sequence.
- b) Some sequence (possibly empty) of characters read from the input sequence.

10 The *result character* is

- a) If the pending sequence is non-empty, the first character of the sequence.
- b) If the pending sequence is empty then the next character that would be read from the input sequence.

11 The *backup sequence* is defined as the concatenation of:

- a) If `eback()` is null then empty,
- b) Otherwise the `gptr() - eback()` characters beginning at `eback()`.

12 *Effects:* The function sets up the `gptr()` and `egptr()` satisfying one of:

- a) If the pending sequence is non-empty, `egptr()` is non-null and `egptr() - gptr()` characters starting at `gptr()` are the characters in the pending sequence
- b) If the pending sequence is empty, either `gptr()` is null or `gptr()` and `egptr()` are set to the same non-null pointer value.

13 If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either:

- a) If the backup sequence contains at least `gptr() - eback()` characters, then the `gptr() - eback()` characters starting at `eback()` agree with the last `gptr() - eback()` characters of the backup sequence.

---

310) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xsputn()` by overriding these definitions from the base class.

- b) Or the `n` characters starting at `gptr() - n` agree with the backup sequence (where `n` is the length of the backup sequence)

14 *Default behavior:* Returns `traits::eof()`.

`int_type uflow();`

15 *Requires:* The constraints are the same as for `underflow()`, except that the result character shall be transferred from the pending sequence to the backup sequence, and the pending sequence shall not be empty before the transfer.

16 *Default behavior:* Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increment the value of the next pointer for the input sequence.

17 *Returns:* `traits::eof()` to indicate failure.

#### 27.6.3.4.4 Putback

[`streambuf.virt.pback`]

`int_type pbackfail(int_type c = traits::eof());`

1 *Remarks:* The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

The *pending sequence* is defined as for `underflow()`, with the modifications that

- (1.1) — If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.
- (1.2) — If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

2 *Postcondition:* On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

3 *Returns:* `traits::eof()` to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers could not be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

4 Returns some value other than `traits::eof()` to indicate success.

5 *Default behavior:* Returns `traits::eof()`.

#### 27.6.3.4.5 Put area

[`streambuf.virt.put`]

`streamsize xsputn(const char_type* s, streamsize n);`

1 *Effects:* Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes true or whether it achieves the same effects by other means.

2 *Returns:* The number of characters written.

`int_type overflow(int_type c = traits::eof());`

3 *Effects:* Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

- a) if `pbase()` is null then the empty sequence otherwise, `pptr() - pbase()` characters beginning at `pbase()`.
- b) if `traits::eq_int_type(c, traits::eof())` returns `true`, then the empty sequence otherwise, the sequence consisting of `c`.

4 *Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

5 *Requires:* Every overriding definition of this virtual function shall obey the following constraints:

- 1) The effect of consuming a character on the associated output sequence is specified<sup>311</sup>
- 2) Let `r` be the number of characters in the pending sequence not consumed. If `r` is non-zero then `pbase()` and `pptr()` shall be set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.
- 3) The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.

6 *Returns:* `traits::eof()` or throws an exception if the function fails.

Otherwise, returns some value other than `traits::eof()` to indicate success.<sup>312</sup>

7 *Default behavior:* Returns `traits::eof()`.

## 27.7 Formatting and manipulators

[iostream.format]

### 27.7.1 Overview

[iostream.format.overview]

#### Header <iostream> synopsis

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
        class basic_istream;
    typedef basic_istream<char>      istream;
    typedef basic_istream<wchar_t> wistream;

    template <class charT, class traits = char_traits<charT> >
        class basic_iostream;
    typedef basic_iostream<char>      iostream;
    typedef basic_iostream<wchar_t> wiostream;

    template <class charT, class traits>
        basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template <class charT, class traits, class T>
        basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>&& is, T& x);
}
```

#### Header <ostream> synopsis

311) That is, for each class derived from an instance of `basic_streambuf` in this Clause (27.8.2, 27.9.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.

312) Typically, `overflow` returns `c` to indicate success, except when `traits::eq_int_type(c, traits::eof())` returns `true`, in which case it returns `traits::not_eof(c)`.

```

namespace std {
    template <class charT, class traits = char_traits<charT> >
        class basic_ostream;
    typedef basic_ostream<char>          ostream;
    typedef basic_ostream<wchar_t> wostream;

    template <class charT, class traits>
        basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
    template <class charT, class traits>
        basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
    template <class charT, class traits>
        basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

    template <class charT, class traits, class T>
        basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>&& os, const T& x);
}

```

## Header <iomanip> synopsis

```

namespace std {
    // types T1, T2, ... are unspecified implementation types
    T1 resetiosflags(ios_base::fmtflags mask);
    T2 setiosflags (ios_base::fmtflags mask);
    T3 setbase(int base);
    template<charT> T4 setfill(charT c);
    T5 setprecision(int n);
    T6 setw(int n);
    template <class moneyT> T7 get_money(moneyT& mon, bool intl = false);
    template <class moneyT> T8 put_money(const moneyT& mon, bool intl = false);
    template <class charT> T9 get_time(struct tm* tmb, const charT* fmt);
    template <class charT> T10 put_time(const struct tm* tmb, const charT* fmt);

    template <class charT>
        T11 quoted(const charT* s, charT delim = charT(''), charT escape = charT('\\'));

    template <class charT, class traits, class Allocator>
        T12 quoted(const basic_string<charT, traits, Allocator>& s,
            charT delim = charT(''), charT escape = charT('\\'));

    template <class charT, class traits, class Allocator>
        T13 quoted(basic_string<charT, traits, Allocator>& s,
            charT delim = charT(''), charT escape = charT('\\'));
}

```

## 27.7.2 Input streams

[input.streams]

- <sup>1</sup> The header <istream> defines two types and a function signature that control input from a stream buffer along with a function template that extracts from stream rvalues.

### 27.7.2.1 Class template basic\_istream

[istream]

```

namespace std {
    template <class charT, class traits = char_traits<charT> >
        class basic_istream
        : virtual public basic_ios<charT, traits> {

```

```

public:
    // types (inherited from basic_ios (27.5.5)):
    typedef charT          char_type;
    typedef typename traits::int_type int_type;
    typedef typename traits::pos_type pos_type;
    typedef typename traits::off_type off_type;
    typedef traits          traits_type;

    // 27.7.2.1.1, constructor/destructor:
    explicit basic_istream(basic_streambuf<charT, traits>* sb);
    virtual ~basic_istream();

    // 27.7.2.1.3, prefix/suffix:
    class sentry;

    // 27.7.2.2, formatted input:
    basic_istream<charT, traits>& operator>>(
        basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&));
    basic_istream<charT, traits>& operator>>(
        basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
    basic_istream<charT, traits>& operator>>(
        ios_base& (*pf)(ios_base&));

    basic_istream<charT, traits>& operator>>(bool& n);
    basic_istream<charT, traits>& operator>>(short& n);
    basic_istream<charT, traits>& operator>>(unsigned short& n);
    basic_istream<charT, traits>& operator>>(int& n);
    basic_istream<charT, traits>& operator>>(unsigned int& n);
    basic_istream<charT, traits>& operator>>(long& n);
    basic_istream<charT, traits>& operator>>(unsigned long& n);
    basic_istream<charT, traits>& operator>>(long long& n);
    basic_istream<charT, traits>& operator>>(unsigned long long& n);
    basic_istream<charT, traits>& operator>>(float& f);
    basic_istream<charT, traits>& operator>>(double& f);
    basic_istream<charT, traits>& operator>>(long double& f);

    basic_istream<charT, traits>& operator>>(void*& p);
    basic_istream<charT, traits>& operator>>(
        basic_streambuf<char_type, traits>* sb);

    // 27.7.2.3, unformatted input:
    streamsize gcount() const;
    int_type get();
    basic_istream<charT, traits>& get(char_type& c);
    basic_istream<charT, traits>& get(char_type* s, streamsize n);
    basic_istream<charT, traits>& get(char_type* s, streamsize n,
        char_type delim);
    basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);
    basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb,
        char_type delim);

    basic_istream<charT, traits>& getline(char_type* s, streamsize n);
    basic_istream<charT, traits>& getline(char_type* s, streamsize n,
        char_type delim);

```

```

    basic_istream<charT, traits>& ignore(
        streamsize n = 1, int_type delim = traits::eof());
    int_type peek();
    basic_istream<charT, traits>& read (char_type* s, streamsize n);
    streamsize readsome(char_type* s, streamsize n);

    basic_istream<charT, traits>& putback(char_type c);
    basic_istream<charT, traits>& unget();
    int sync();

    pos_type tellg();
    basic_istream<charT, traits>& seekg(pos_type);
    basic_istream<charT, traits>& seekg(off_type, ios_base::seekdir);

protected:
    basic_istream(const basic_istream& rhs) = delete;
    basic_istream(basic_istream&& rhs);

    // 27.7.2.1.2, assign and swap:
    basic_istream& operator=(const basic_istream& rhs) = delete;
    basic_istream& operator=(basic_istream&& rhs);
    void swap(basic_istream& rhs);
};

// 27.7.2.2.3, character extraction templates:
template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&,
                                            charT&);

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&,
                                            unsigned char&);

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&,
                                            signed char&);

template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&,
                                            charT*);

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&,
                                            unsigned char*);

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&,
                                            signed char*);
}

```

- <sup>1</sup> The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
- <sup>2</sup> Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rdbuf()->sbumpc()` or `rdbuf()->sgetc()`. They may use other public members of `istream`.
- <sup>3</sup> If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then the input function, except as explicitly noted otherwise, completes its actions and does `setstate(eofbit)`, which may throw `ios_`-

`base::failure` (27.5.5.4), before returning.

- 4 If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

#### 27.7.2.1.1 `basic_istream` constructors

[istream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

- 1 *Effects:* Constructs an object of class `basic_istream`, assigning initial values to the base class by calling `basic_ios::init(sb)` (27.5.5.2).

- 2 *Postcondition:* `gcount() == 0`

```
basic_istream(basic_istream&& rhs);
```

- 3 *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class, copying the `gcount()` from `rhs`, calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and setting the `gcount()` for `rhs` to 0.

```
virtual ~basic_istream();
```

- 4 *Effects:* Destroys an object of class `basic_istream`.

- 5 *Remarks:* Does not perform any operations of `rdbuf()`.

#### 27.7.2.1.2 Class `basic_istream` assign and swap

[istream.assign]

```
basic_istream& operator=(basic_istream&& rhs);
```

- 1 *Effects:* As if by `swap(rhs)`.

- 2 *Returns:* `*this`.

```
void swap(basic_istream& rhs);
```

- 3 *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

#### 27.7.2.1.3 Class `basic_istream::sentry`

[istream::sentry]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_istream<charT, traits>::sentry {
        typedef traits traits_type;
        bool ok_; // exposition only
    public:
        explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

- 1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
```

<sup>2</sup> *Effects:* If `is.good()` is `false`, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.<sup>313</sup> If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

<sup>3</sup> *Remarks:* The constructor `explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false)` uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

<sup>4</sup> To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>> >(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.
```

<sup>5</sup> If, after any preparation is completed, `is.good()` is `true`, `ok_ != false` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (27.5.5.4))<sup>314</sup>

`~sentry();`

<sup>6</sup> *Effects:* None.

`explicit operator bool() const;`

<sup>7</sup> *Effects:* Returns `ok_`.

### 27.7.2.2 Formatted input functions [istream.formatted]

#### 27.7.2.2.1 Common requirements [istream.formatted.reqmts]

<sup>1</sup> Each formatted input function begins execution by constructing an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. If an exception is thrown during input then `ios::badbit` is turned on<sup>315</sup> in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

#### 27.7.2.2.2 Arithmetic extractors [istream.formatted.arithmetic]

```
operator>>(unsigned short& val);
operator>>(unsigned int& val);
operator>>(long& val);
operator>>(unsigned long& val);
operator>>(long long& val);
operator>>(unsigned long long& val);
```

313) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

314) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

315) This is done without causing an `ios::failure` to be thrown.

```

operator>>(float& val);
operator>>(double& val);
operator>>(long double& val);
operator>>(bool& val);
operator>>(void*& val);

```

- <sup>1</sup> As in the case of the inserters, these extractors depend on the locale's `num_get<>` (22.4.2.1) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 27.7.2.1). After a sentry object is constructed, the conversion occurs as if performed by the following code fragment:

```

typedef num_get< charT, istreambuf_iterator<charT, traits> > numget;
iostate err = iostate::goodbit;
use_facet< numget >(loc).get(*this, 0, *this, err, val);
setstate(err);

```

In the above fragment, `loc` stands for the private member of the `basic_ios` class. [*Note:* The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — *end note*] Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```

operator>>(short& val);

```

- <sup>2</sup> The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

typedef num_get<charT, istreambuf_iterator<charT, traits> > numget;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::max();
} else
    val = static_cast<short>(lval);
setstate(err);

```

```

operator>>(int& val);

```

- <sup>3</sup> The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

typedef num_get<charT, istreambuf_iterator<charT, traits> > numget;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
setstate(err);

```

### 27.7.2.2.3 `basic_istream::operator>>` [istream::extractors]

```
basic_istream<charT, traits>& operator>>
    (basic_istream<charT, traits>& (*pf)(basic_istream<charT, traits>&));
```

1     *Effects:* None. This extractor does not behave as a formatted input function (as described in 27.7.2.2.1.)

2     *Returns:* `pf(*this)`.<sup>316</sup>

```
basic_istream<charT, traits>& operator>>
    (basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3     *Effects:* Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in 27.7.2.2.1).

4     *Returns:* `*this`.

```
basic_istream<charT, traits>& operator>>
    (ios_base& (*pf)(ios_base&));
```

5     *Effects:* Calls `pf(*this)`.<sup>317</sup> This extractor does not behave as a formatted input function (as described in 27.7.2.2.1).

6     *Returns:* `*this`.

```
template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in,
                                           charT* s);
```

```
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in,
                                           unsigned char* s);
```

```
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in,
                                           signed char* s);
```

7     *Effects:* Behaves like a formatted input member (as described in 27.7.2.2.1) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into successive locations of an array whose first element is designated by `s`. If `width()` is greater than zero, `n` is `width()`. Otherwise `n` is the number of elements of the largest array of `char_type` that can store a terminating `charT()`. `n` is the maximum number of characters stored.

8     Characters are extracted and stored until any of the following occurs:

- (8.1)     — `n-1` characters are stored;
- (8.2)     — end of file occurs on the input sequence;
- (8.3)     — `ct.is(ct.space, c)` is `true` for the next available input character `c`, where `ct` is `use_facet<ctype<charT>>(in.getloc())`.

9     `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

10     If the function extracted no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (27.5.5.4).

11     *Returns:* `in`.

316) See, for example, the function signature `ws(basic_istream&)` (27.7.2.4).

317) See, for example, the function signature `dec(ios_base&)` (27.5.6.3).

```

template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in,
                                           charT& c);

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in,
                                           unsigned char& c);

template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in,
                                           signed char& c);

```

12 *Effects:* Behaves like a formatted input member (as described in 27.7.2.2.1) of `in`. After a `sentry` object is constructed a character is extracted from `in`, if one is available, and stored in `c`. Otherwise, the function calls `in.setstate(failbit)`.

13 *Returns:* `in`.

```

basic_istream<charT, traits>& operator>>
    (basic_streambuf<charT, traits>* sb);

```

14 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). If `sb` is null, calls `setstate(failbit)`, which may throw `ios_base::failure` (27.5.5.4). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

- (14.1) — end-of-file occurs on the input sequence;
- (14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (14.3) — an exception occurs (in which case the exception is caught).

15 If the function inserts no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (27.5.5.4). If it inserted no characters because it caught an exception thrown while extracting characters from `*this` and `failbit` is on in `exceptions()` (27.5.5.4), then the caught exception is rethrown.

16 *Returns:* `*this`.

### 27.7.2.3 Unformatted input functions

[istream.unformatted]

1 Each unformatted input function begins execution by constructing an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object returns `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of non-zero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If an exception is thrown during input then `ios::badbit` is turned on<sup>318</sup> in `*this`'s error state. (Exceptions thrown from `basic_ios<>::clear()` are not caught or rethrown.) If `(exceptions() & badbit) != 0` then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the `sentry` object is destroyed before leaving the unformatted input function.

```

streamsize gcount() const;

```

2 *Effects:* None. This member function does not behave as an unformatted input function (as described in 27.7.2.3, paragraph 1).

318) This is done without causing an `ios::failure` to be thrown.

3 *Returns:* The number of characters extracted by the last unformatted input member function called for the object.

```
int_type get();
```

4 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, extracts a character *c*, if one is available. Otherwise, the function calls `setstate(failbit)`, which may throw `ios_base::failure` (27.5.5.4),

5 *Returns:* *c* if available, otherwise `traits::eof()`.

```
basic_istream<charT, traits>& get(char_type& c);
```

6 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, extracts a character, if one is available, and assigns it to *c*.<sup>319</sup> Otherwise, the function calls `setstate(failbit)` (which may throw `ios_base::failure` (27.5.5.4)).

7 *Returns:* *\*this*.

```
basic_istream<charT, traits>& get(char_type* s, streamsize n,
                                char_type delim);
```

8 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by *s*.<sup>320</sup> Characters are extracted and stored until any of the following occurs:

- (8.1) — *n* is less than one or *n* - 1 characters are stored;
- (8.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate eofbit`);
- (8.3) — `traits::eq(c, delim)` for the next available input character *c* (in which case *c* is not extracted).

9 If the function stores no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (27.5.5.4)). In any case, if *n* is greater than zero it then stores a null character into the next successive location of the array.

10 *Returns:* *\*this*.

```
basic_istream<charT, traits>& get(char_type* s, streamsize n);
```

11 *Effects:* Calls `get(s, n, widen('\n'))`.

12 *Returns:* Value returned by the call.

```
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb,
                                char_type delim);
```

13 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, extracts characters and inserts them in the output sequence controlled by *sb*. Characters are extracted and inserted until any of the following occurs:

- (13.1) — end-of-file occurs on the input sequence;
- (13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (13.3) — `traits::eq(c, delim)` for the next available input character *c* (in which case *c* is not extracted);
- (13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

319) Note that this function is not overloaded on types `signed char` and `unsigned char`.

320) Note that this function is not overloaded on types `signed char` and `unsigned char`.

14 If the function inserts no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (27.5.5.4).

15 *Returns:* `*this`.

```
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);
```

16 *Effects:* Calls `get(sb, widen('\n'))`.

17 *Returns:* Value returned by the call.

```
basic_istream<charT, traits>& getline(char_type* s, streamsize n,
                                     char_type delim);
```

18 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.<sup>321</sup> Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls `setstate eofbit`);
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);<sup>322</sup>
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

19 These conditions are tested in the order shown.<sup>323</sup>

20 If the function extracts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (27.5.5.4)).<sup>324</sup>

21 In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

22 *Returns:* `*this`.

23 [ *Example:*

```
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";    // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
```

321) Note that this function is not overloaded on types `signed char` and `unsigned char`.

322) Since the final input character is “extracted,” it is counted in the `gcount()`, even though it is not stored.

323) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

324) This implies an empty input line will not cause `failbit` to be set.

```

        count--; // Don't include newline in count
        cout << "Line " << ++line_number;
    }
    cout << " (" << count << " chars): " << buffer << endl;
}
}

```

— end example]

```
basic_istream<charT, traits>& getline(char_type* s, streamsize n);
```

24 *Returns:* `getline(s, n, widen('\n'))`

```
basic_istream<charT, traits>&
ignore(streamsize n = 1, int_type delim = traits::eof());
```

25 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:

- (25.1) — `n != numeric_limits<streamsize>::max()` (18.3.2) and `n` characters have been extracted so far
- (25.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`, which may throw `ios_base::failure` (27.5.5.4));
- (25.3) — `traits::eq_int_type(traits::to_int_type(c), delim)` for the next available input character `c` (in which case `c` is extracted).

26 *Remarks:* The last condition will never occur if `traits::eq_int_type(delim, traits::eof())`.

27 *Returns:* `*this`.

```
int_type peek();
```

28 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, reads but does not extract the current input character.

29 *Returns:* `traits::eof()` if `good()` is `false`. Otherwise, returns `rdbuf()->sgetc()`.

```
basic_istream<charT, traits>& read(char_type* s, streamsize n);
```

30 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`.<sup>325</sup> Characters are extracted and stored until either of the following occurs:

- (30.1) — `n` characters are stored;
- (30.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate(failbit | eofbit)`, which may throw `ios_base::failure` (27.5.5.4)).

31 *Returns:* `*this`.

```
streamsize readsome(char_type* s, streamsize n);
```

---

325) Note that this function is not overloaded on types `signed char` and `unsigned char`.

32 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1). After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`. If `rdbuf()->in_avail() == -1`, calls `setstate eofbit` (which may throw `ios_base::failure` (27.5.5.4)), and extracts no characters;

(32.1) — If `rdbuf()->in_avail() == 0`, extracts no characters

(32.2) — If `rdbuf()->in_avail() > 0`, extracts `min(rdbuf()->in_avail(), n)`.

33 *Returns:* The number of characters extracted.

```
basic_istream<charT, traits>& putback(char_type c);
```

34 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that the function first clears `eofbit`. After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sputbackc()`. If `rdbuf()` is null, or if `sputbackc()` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (27.5.5.4)). [ *Note:* This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — *end note* ]

35 *Returns:* `*this`.

```
basic_istream<charT, traits>& unget();
```

36 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that the function first clears `eofbit`. After constructing a sentry object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sungetc()`. If `rdbuf()` is null, or if `sungetc()` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (27.5.5.4)). [ *Note:* This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — *end note* ]

37 *Returns:* `*this`.

```
int sync();
```

38 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `rdbuf()` is a null pointer, returns `-1`. Otherwise, calls `rdbuf()->pubsync()` and, if that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (27.5.5.4), and returns `-1`. Otherwise, returns zero.

```
pos_type tellg();
```

39 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

40 *Returns:* After constructing a sentry object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, in)`.

```
basic_istream<charT, traits>& seekg(pos_type pos);
```

41 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

42 *Returns:* `*this`.

```
basic_istream<charT, traits>& seekg(off_type off, ios_base::seekdir dir);
```

43 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a sentry object, if `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

44 *Returns:* `*this`.

#### 27.7.2.4 Standard `basic_istream` manipulators

[istream.manip]

```
template <class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

1 *Effects:* Behaves as an unformatted input function (as described in 27.7.2.3, paragraph 1), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a sentry object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (27.7.2.1.3). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

2 *Returns:* `is`.

#### 27.7.2.5 Class template `basic_iostream`

[iostreamclass]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_iostream
    : public basic_istream<charT, traits>,
      public basic_ostream<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;

        // 27.7.2.5.1, constructor:
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 27.7.2.5.2, destructor:
        virtual ~basic_iostream();

    protected:
        // 27.7.2.5.1, constructor:
        basic_iostream(const basic_iostream& rhs) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 27.7.2.5.3, assign and swap:
        basic_iostream& operator=(const basic_iostream& rhs) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    };
}
```

- <sup>1</sup> The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

#### 27.7.2.5.1 `basic_iostream` constructors [iostream.cons]

```
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_iostream`, assigning initial values to the base classes by calling `basic_istream<charT, traits>(sb)` (27.7.2.1) and `basic_ostream<charT, traits>(sb)` (27.7.3.1).
- <sup>2</sup> *Postcondition:* `rdbuf()` == `sb` and `gcount()` == 0.

```
basic_iostream(basic_iostream&& rhs);
```

- <sup>3</sup> *Effects:* Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `move(rhs)`.

#### 27.7.2.5.2 `basic_iostream` destructor [iostream.dest]

```
virtual ~basic_iostream();
```

- <sup>1</sup> *Effects:* Destroys an object of class `basic_iostream`.
- <sup>2</sup> *Remarks:* Does not perform any operations on `rdbuf()`.

#### 27.7.2.5.3 `basic_iostream` assign and swap [iostream.assign]

```
basic_iostream& operator=(basic_iostream&& rhs);
```

- <sup>1</sup> *Effects:* As if by `swap(rhs)`.

```
void swap(basic_iostream& rhs);
```

- <sup>2</sup> *Effects:* Calls `basic_istream<charT, traits>::swap(rhs)`.

#### 27.7.2.6 Rvalue stream extraction [istream.rvalue]

```
template <class charT, class traits, class T>
    basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>&& is, T& x);
```

- <sup>1</sup> *Effects:* As if by: `is >>x;`
- <sup>2</sup> *Returns:* `is`

### 27.7.3 Output streams [output.streams]

- <sup>1</sup> The header `<ostream>` defines a type and several function signatures that control output to a stream buffer along with a function template that inserts into stream rvalues.

#### 27.7.3.1 Class template `basic_ostream` [ostream]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_ostream
    : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (27.5.5)):
        typedef charT                char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits                traits_type;
```

```

// 27.7.3.2, constructor/destructor:
explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
virtual ~basic_ostream();

// 27.7.3.4, prefix/suffix:
class sentry;

// 27.7.3.6, formatted output:
basic_ostream<charT, traits>& operator<<(
    basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&));
basic_ostream<charT, traits>& operator<<(
    basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
basic_ostream<charT, traits>& operator<<(
    ios_base& (*pf)(ios_base&));

basic_ostream<charT, traits>& operator<<(bool n);
basic_ostream<charT, traits>& operator<<(short n);
basic_ostream<charT, traits>& operator<<(unsigned short n);
basic_ostream<charT, traits>& operator<<(int n);
basic_ostream<charT, traits>& operator<<(unsigned int n);
basic_ostream<charT, traits>& operator<<(long n);
basic_ostream<charT, traits>& operator<<(unsigned long n);
basic_ostream<charT, traits>& operator<<(long long n);
basic_ostream<charT, traits>& operator<<(unsigned long long n);
basic_ostream<charT, traits>& operator<<(float f);
basic_ostream<charT, traits>& operator<<(double f);
basic_ostream<charT, traits>& operator<<(long double f);

basic_ostream<charT, traits>& operator<<(const void* p);
basic_ostream<charT, traits>& operator<<(
    basic_streambuf<char_type, traits>* sb);

// 27.7.3.7, unformatted output:
basic_ostream<charT, traits>& put(char_type c);
basic_ostream<charT, traits>& write(const char_type* s, streamsize n);

basic_ostream<charT, traits>& flush();

// 27.7.3.5, seeks:
pos_type tellp();
basic_ostream<charT, traits>& seekp(pos_type);
basic_ostream<charT, traits>& seekp(off_type, ios_base::seekdir);
protected:
    basic_ostream(const basic_ostream& rhs) = delete;
    basic_ostream(basic_ostream&& rhs);

// 27.7.3.3, assign and swap:
basic_ostream& operator=(const basic_ostream& rhs) = delete;
basic_ostream& operator=(basic_ostream&& rhs);
void swap(basic_ostream& rhs);
};

// 27.7.3.6.4, character inserters:
template<class charT, class traits>

```

```

        basic_ostream<charT, traits>& operator<<((basic_ostream<charT, traits>&,
                                                    charT);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<((basic_ostream<charT, traits>&,
                                                    char);
template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>&,
                                                    char);

template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>&,
                                                    signed char);
template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>&,
                                                    unsigned char);

template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<((basic_ostream<charT, traits>&,
                                                    const charT*);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<((basic_ostream<charT, traits>&,
                                                    const char*);
template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>&,
                                                    const char*);

template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>&,
                                                    const signed char*);
template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>&,
                                                    const unsigned char*);
}

```

- <sup>1</sup> The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
- <sup>2</sup> Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rdbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xspn()`, and `sync()`.
- <sup>3</sup> If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and treat as an error.

### 27.7.3.2 `basic_ostream` constructors

[ostream.cons]

```
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_ostream`, assigning initial values to the base class by calling `basic_ios<charT, traits>::init(sb)` (27.5.5.2).
- <sup>2</sup> *Postcondition:* `rdbuf() == sb`.  

```
virtual ~basic_ostream();
```

3 *Effects:* Destroys an object of class `basic_ostream`.

4 *Remarks:* Does not perform any operations on `rdbuf()`.

```
basic_ostream(basic_ostream&& rhs);
```

5 *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

### 27.7.3.3 Class `basic_ostream` assign and swap [ostream.assign]

```
basic_ostream& operator=(basic_ostream&& rhs);
```

1 *Effects:* As if by `swap(rhs)`.

2 *Returns:* `*this`.

```
void swap(basic_ostream& rhs);
```

3 *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`.

### 27.7.3.4 Class `basic_ostream::sentry` [ostream::sentry]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_ostream<charT, traits>::sentry {
        bool ok_; // exposition only
    public:
        explicit sentry(basic_ostream<charT, traits>& os);
        ~sentry();
        explicit operator bool() const { return ok_; }

        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream<charT, traits>& os);
```

2 If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.<sup>326</sup>

3 If, after any preparation is completed, `os.good()` is `true`, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (27.5.5.4))<sup>327</sup>

```
~sentry();
```

4 If `(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good()` is `true`, calls `os.rdbuf()->pubsync()`. If that function returns -1, sets `badbit` in `os.rdstate()` without propagating an exception.

```
explicit operator bool() const;
```

5 *Effects:* Returns `ok_`.

<sup>326</sup>) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

<sup>327</sup>) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

### 27.7.3.5 `basic_ostream` seek members [ostream.seek]

- <sup>1</sup> Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```
pos_type tellp();
```

- <sup>2</sup> *Returns:* If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```
basic_ostream<charT, traits>& seekp(pos_type pos);
```

- <sup>3</sup> *Effects:* If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- <sup>4</sup> *Returns:* `*this`.

```
basic_ostream<charT, traits>& seekp(off_type off, ios_base::seekdir dir);
```

- <sup>5</sup> *Effects:* If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- <sup>6</sup> *Returns:* `*this`.

### 27.7.3.6 Formatted output functions [ostream.formatted]

#### 27.7.3.6.1 Common requirements [ostream.formatted.reqmts]

- <sup>1</sup> Each formatted output function begins execution by constructing an object of class `sentry`. If this object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which might throw an exception. If an exception is thrown during output, then `ios::badbit` is turned on<sup>328</sup> in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.
- <sup>2</sup> The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.
- <sup>3</sup> If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

#### 27.7.3.6.2 Arithmetic inserters [ostream.inserters.arithmetic]

```
operator<<(bool val);
operator<<(short val);
operator<<(unsigned short val);
operator<<(int val);
operator<<(unsigned int val);
operator<<(long val);
operator<<(unsigned long val);
operator<<(long long val);
operator<<(unsigned long long val);
operator<<(float val);
operator<<(double val);
```

---

<sup>328</sup>) without causing an `ios::failure` to be thrown.

```
operator<<(long double val);
operator<<(const void* val);
```

- 1 *Effects:* The classes `num_get<>` and `num_put<>` handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits> >
    >(getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits> >
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned short>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits> >
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned int>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits> >
    >(getloc()).put(*this, *this, fill(),
        static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits> >
    >(getloc()).put(*this, *this, fill(),
        static_cast<double>(val)).failed();
```

- 2 The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `iostreams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.
- 3 *Returns:* `*this`.

### 27.7.3.6.3 `basic_ostream::operator<<` [ostream.inserters]

```
basic_ostream<charT, traits>& operator<<
    (basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&));
```

1     *Effects:* None. Does not behave as a formatted output function (as described in 27.7.3.6.1).

2     *Returns:* `pf(*this)`.<sup>329</sup>

```
basic_ostream<charT, traits>& operator<<
    (basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3     *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 27.7.3.6.1).

4     *Returns:* `*this`.<sup>330</sup>

```
basic_ostream<charT, traits>& operator<<
    (ios_base& (*pf)(ios_base&));
```

5     *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 27.7.3.6.1).

6     *Returns:* `*this`.

```
basic_ostream<charT, traits>& operator<<
    (basic_streambuf<charT, traits>* sb);
```

7     *Effects:* Behaves as an unformatted output function (as described in 27.7.3.7, paragraph 1). After the sentry object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8     Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

- (8.1)     — end-of-file occurs on the input sequence;
- (8.2)     — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (8.3)     — an exception occurs while getting a character from `sb`.

9     If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (27.5.5.4)). If an exception was thrown while extracting a character, the function sets `failbit` in error state, and if `failbit` is on in `exceptions()` the caught exception is rethrown.

10     *Returns:* `*this`.

### 27.7.3.6.4 Character inserter function templates [ostream.inserters.character]

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<((basic_ostream<charT, traits>& out,
                                           charT c);
```

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<((basic_ostream<charT, traits>& out,
                                           char c);
```

*// specialization*

```
template<class traits>
    basic_ostream<char, traits>& operator<<((basic_ostream<char, traits>& out,
                                           char c);
```

*// signed and unsigned*

329) See, for example, the function signature `endl(basic_ostream&)` (27.7.3.8).

330) See, for example, the function signature `dec(ios_base&)` (27.5.6.3).

```
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                           signed char c);
```

```
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                           unsigned char c);
```

- 1 *Effects:* Behaves as a formatted output function ( 27.7.3.6.1) of out. Constructs a character sequence seq. If c has type char and the character type of the stream is not char, then seq consists of out.widen(c); otherwise seq consists of c. Determines padding for seq as described in 27.7.3.6.1. Inserts seq into out. Calls os.width(0).

- 2 *Returns:* out.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out,
                                           const charT* s);
```

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out,
                                           const char* s);
```

```
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                           const char* s);
```

```
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                           const signed char* s);
```

```
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                           const unsigned char* s);
```

- 3 *Requires:* s shall not be a null pointer.

- 4 *Effects:* Behaves like a formatted inserter (as described in 27.7.3.6.1) of out. Creates a character sequence seq of n characters starting at s, each widened using out.widen() (27.5.5.3), where n is the number that would be computed as if by:

- (4.1) — traits::length(s) for the overload where the first argument is of type basic\_ostream<charT, traits>& and the second is of type const charT\*, and also for the overload where the first argument is of type basic\_ostream<char, traits>& and the second is of type const char\*,
- (4.2) — std::char\_traits<char>::length(s) for the overload where the first argument is of type basic\_ostream<charT, traits>& and the second is of type const char\*,
- (4.3) — traits::length(reinterpret\_cast<const char\*>(s)) for the other two overloads.

Determines padding for seq as described in 27.7.3.6.1. Inserts seq into out. Calls width(0).

- 5 *Returns:* out.

### 27.7.3.7 Unformatted output functions

[ostream.unformatted]

- 1 Each unformatted output function begins execution by constructing an object of class sentry. If this object returns true, while converting to a value of type bool, the function endeavors to generate the requested output. If an exception is thrown during output, then ios::badbit is turned on<sup>331</sup> in \*this's error state. If (exceptions() & badbit) != 0 then the exception is rethrown. In any case, the unformatted output function ends by destroying the sentry object, then, if no exception was thrown, returning the value specified for the unformatted output function.

<sup>331</sup>) without causing an ios::failure to be thrown.

```
basic_ostream<charT, traits>& put(char_type c);
```

2     *Effects:* Behaves as an unformatted output function (as described in 27.7.3.7, paragraph 1). After constructing a sentry object, inserts the character `c`, if possible.<sup>332</sup>

3     Otherwise, calls `setstate(badbit)` (which may throw `ios_base::failure` (27.5.5.4)).

4     *Returns:* `*this`.

```
basic_ostream& write(const char_type* s, streamsize n);
```

5     *Effects:* Behaves as an unformatted output function (as described in 27.7.3.7, paragraph 1). After constructing a sentry object, obtains characters to insert from successive locations of an array whose first element is designated by `s`.<sup>333</sup> Characters are inserted until either of the following occurs:

(5.1)     — `n` characters are inserted;

(5.2)     — inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (27.5.5.4)).

6     *Returns:* `*this`.

```
basic_ostream& flush();
```

7     *Effects:* Behaves as an unformatted output function (as described in 27.7.3.7, paragraph 1). If `rdbuf()` is not a null pointer, constructs a sentry object. If this object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (27.5.5.4)). Otherwise, if the sentry object returns `false`, does nothing.

8     *Returns:* `*this`.

### 27.7.3.8 Standard `basic_ostream` manipulators

[ostream.manip]

```
template <class charT, class traits>
```

```
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

1     *Effects:* Calls `os.put(os.widen('\n'))`, then `os.flush()`.

2     *Returns:* `os`.

```
template <class charT, class traits>
```

```
    basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

3     *Effects:* Inserts a null character into the output sequence: calls `os.put(charT())`.

4     *Returns:* `os`.

```
template <class charT, class traits>
```

```
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

5     *Effects:* Calls `os.flush()`.

6     *Returns:* `os`.

### 27.7.3.9 Rvalue stream insertion

[ostream.rvalue]

```
template <class charT, class traits, class T>
```

```
    basic_ostream<charT, traits>&
```

```
    operator<<(basic_ostream<charT, traits>&& os, const T& x);
```

1     *Effects:* As if by: `os << x;`

2     *Returns:* `os`

332) Note that this function is not overloaded on types `signed char` and `unsigned char`.

333) Note that this function is not overloaded on types `signed char` and `unsigned char`.

## 27.7.4 Standard manipulators [std.manip]

- <sup>1</sup> The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

*unspecified* `resetiosflags(ios_base::fmtflags mask);`

- <sup>2</sup> *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:<sup>334</sup>

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` shall have type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setiosflags(ios_base::fmtflags mask);`

- <sup>3</sup> *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression `out << setiosflags(mask)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` shall have type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setbase(int base);`

- <sup>4</sup> *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
            base == 10 ? ios_base::dec :
            base == 16 ? ios_base::hex :
            ios_base::fmtflags(0), ios_base::basefield);
}
```

---

<sup>334</sup> The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

The expression `out << setbase(base)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` shall have type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setfill(char_type c);`

- 5 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}
```

The expression `out << setfill(c)` shall have type `basic_ostream<charT, traits>&` and value `out`.

*unspecified* `setprecision(int n);`

- 6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}
```

The expression `out << setprecision(n)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setprecision(n)` shall have type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setw(int n);`

- 7 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set width
    str.width(n);
}
```

The expression `out << setw(n)` shall have type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setw(n)` shall have type `basic_istream<charT, traits>&` and value `in`.

### 27.7.5 Extended manipulators

[ext.manip]

- 1 The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

```
template <class moneyT> unspecified get_money(moneyT& mon, bool intl = false);
```

2 *Requires:* The type `moneyT` shall be either long double or a specialization of the `basic_string` template (Clause 21).

3 *Effects:* The expression in `>>get_money(mon, intl)` described below behaves as a formatted input function (27.7.2.2.1).

4 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression in `>> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```
template <class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    typedef istreambuf_iterator<charT, traits> Iter;
    typedef money_get<charT, Iter> MoneyGet;

    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet &mg = use_facet<MoneyGet>(str.getloc());

    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

    if (ios_base::goodbit != err)
        str.setstate(err);
}
```

The expression in `>> get_money(mon, intl)` shall have type `basic_istream<charT, traits>&` and value `in`.

```
template <class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
```

5 *Requires:* The type `moneyT` shall be either long double or a specialization of the `basic_string` template (Clause 21).

6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function (27.7.3.6.1) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```
template <class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
    typedef ostreambuf_iterator<charT, traits> Iter;
    typedef money_put<charT, Iter> MoneyPut;

    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

    if (end.failed())
        str.setstate(ios::badbit);
}
```

The expression `out << put_money(mon, intl)` shall have type `basic_ostream<charT, traits>&` and value `out`.

```
template <class charT> unspecified get_time(struct tm* tmb, const charT* fmt);
```

7 *Requires:* The argument `tmb` shall be a valid pointer to an object of type `struct tm`, and the argument `fmt` shall be a valid pointer to an array of objects of type `charT` with `char_traits<charT>::length(fmt)` elements.

8 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression in `>> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```

template <class charT, class traits>
void f(basic_ios<charT, traits>& str, struct tm* tmb, const charT* fmt) {
    typedef istreambuf_iterator<charT, traits> Iter;
    typedef time_get<charT, Iter> TimeGet;

    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());

    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
        fmt, fmt + traits::length(fmt));

    if (err != ios_base::goodbit)
        str.setstate(err);
}

```

The expression in `>> get_time(tmb, fmt)` shall have type `basic_istream<charT, traits>&` and value `in`.

```

template <class charT> unspecified put_time(const struct tm* tmb, const charT* fmt);

```

<sup>9</sup> *Requires:* The argument `tmb` shall be a valid pointer to an object of type `struct tm`, and the argument `fmt` shall be a valid pointer to an array of objects of type `charT` with `char_traits<charT>::length(fmt)` elements.

<sup>10</sup> *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```

template <class charT, class traits>
void f(basic_ios<charT, traits>& str, const struct tm* tmb, const charT* fmt) {
    typedef ostreambuf_iterator<charT, traits> Iter;
    typedef time_put<charT, Iter> TimePut;

    const TimePut& tp = use_facet<TimePut>(str.getloc());
    const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
        fmt, fmt + traits::length(fmt));

    if (end.failed())
        str.setstate(ios_base::badbit);
}

```

The expression `out << put_time(tmb, fmt)` shall have type `basic_ostream<charT, traits>&` and value `out`.

### 27.7.6 Quoted manipulators

[quoted.manip]

<sup>1</sup> [Note: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — end note]

```

template <class charT>
unspecified quoted(const charT* s, charT delim = charT('\"'), charT escape = charT('\\'));
template <class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
    charT delim = charT('\"'), charT escape = charT('\\'));

```

2 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second form is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (27.7.3.6.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- (2.1) — `delim`.
- (2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- (2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 27.7.3.6.1, `seq` is inserted as if by calling `out.rdbuf()->sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` shall have type `basic_ostream<charT, traits>&` and value `out`.

```
template <class charT, class traits, class Allocator>
    unspecified quoted(basic_string<charT, traits, Allocator>& s,
                      charT delim = charT(' '), charT escape = charT('\\'));

```

3 *Returns:* An object of unspecified type such that:

- (3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `basic_istream::operator>>` (27.7.2.2.3) which may throw `ios_base::failure` (27.5.3.1.1):
  - (3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
    - (3.1.1.1) — Turn off the `skipws` flag.
    - (3.1.1.2) — `s.clear()`
    - (3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
    - (3.1.1.4) — Discard the final `delim` character.
    - (3.1.1.5) — Restore the `skipws` flag to its original value.
  - (3.1.2) — Otherwise, `in >> s`.
- (3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.

The expression `in >> quoted(s, delim, escape)` shall have type `basic_istream<charT, traits>&` and value `in`. The expression `out << quoted(s, delim, escape)` shall have type `basic_ostream<charT, traits>&` and value `out`.

## 27.8 String-based streams

[string.streams]

### 27.8.1 Overview

[string.streams.overview]

1 The header `<sstream>` defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 21.3.

#### Header `<sstream>` synopsis

```

namespace std {
    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
        class basic_stringbuf;

    typedef basic_stringbuf<char>          stringbuf;
    typedef basic_stringbuf<wchar_t> wstringbuf;

    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
        class basic_istreamstream;

    typedef basic_istreamstream<char>      istreamstream;
    typedef basic_istreamstream<wchar_t> wistreamstream;

    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
        class basic_ostringstream;
    typedef basic_ostringstream<char>      ostreamstream;
    typedef basic_ostringstream<wchar_t> wostreamstream;

    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
        class basic_stringstream;
    typedef basic_stringstream<char>        stringstream;
    typedef basic_stringstream<wchar_t> wstringstream;
}

```

## 27.8.2 Class template basic\_stringbuf

[stringbuf]

```

namespace std {
    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
        class basic_stringbuf
        : public basic_streambuf<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;
        typedef Allocator        allocator_type;

        // 27.8.2.1, constructors:
        explicit basic_stringbuf(
            ios_base::openmode which = ios_base::in | ios_base::out);
        explicit basic_stringbuf(
            const basic_string<charT, traits, Allocator>& str,
            ios_base::openmode which = ios_base::in | ios_base::out);
        basic_stringbuf(const basic_stringbuf& rhs) = delete;
        basic_stringbuf(basic_stringbuf&& rhs);

        // 27.8.2.2, assign and swap:
        basic_stringbuf& operator=(const basic_stringbuf& rhs) = delete;
        basic_stringbuf& operator=(basic_stringbuf&& rhs);

```

```

void swap(basic_stringbuf& rhs);

// 27.8.2.3, get and set:
basic_string<charT, traits, Allocator> str() const;
void str(const basic_string<charT, traits, Allocator>& s);

protected:
// 27.8.2.4, overridden virtual functions:
virtual int_type underflow();
virtual int_type pbackfail(int_type c = traits::eof());
virtual int_type overflow (int_type c = traits::eof());
virtual basic_streambuf<charT, traits>* setbuf(charT*, streamsize);

virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual pos_type seekpos(pos_type sp,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);

private:
    ios_base::openmode mode; // exposition only
};

template <class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y);
}

```

- 1 The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.
- 2 For the sake of exposition, the maintained data is presented here as:
  - (2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

### 27.8.2.1 `basic_stringbuf` constructors

[stringbuf.cons]

```

explicit basic_stringbuf(
    ios_base::openmode which = ios_base::in | ios_base::out);

```

- 1 *Effects:* Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` (27.6.3.1), and initializing mode with `which`.
- 2 *Postcondition:* `str() == ""`.

```

explicit basic_stringbuf(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);

```

- 3 *Effects:* Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` (27.6.3.1), and initializing mode with `which`. Then calls `str(s)`.

```

basic_stringbuf(basic_stringbuf&& rhs);

```

- 4 *Effects:* Move constructs from the rvalue `rhs`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which

`rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. The openmode, locale and any other state of `rhs` is also copied.

5 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

```
(5.1)   — str() == rhs_p.str()
(5.2)   — gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
(5.3)   — egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
(5.4)   — pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
(5.5)   — epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
(5.6)   — if (eback()) eback() != rhs_a.eback()
(5.7)   — if (gptr()) gptr() != rhs_a.gptr()
(5.8)   — if (egptr()) egptr() != rhs_a.egptr()
(5.9)   — if (pbase()) pbase() != rhs_a.pbase()
(5.10)  — if (pptr()) pptr() != rhs_a.pptr()
(5.11)  — if (epptr()) epptr() != rhs_a.epptr()
```

### 27.8.2.2 Assign and swap

[stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1 *Effects:* After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 27.8.2.1).

2 *Returns:* `*this`.

```
void swap(basic_stringbuf& rhs);
```

3 *Effects:* Exchanges the state of `*this` and `rhs`.

```
template <class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
         basic_stringbuf<charT, traits, Allocator>& y);
```

4 *Effects:* As if by `x.swap(y)`.

### 27.8.2.3 Member functions

[stringbuf.members]

```
basic_string<charT, traits, Allocator> str() const;
```

1 *Returns:* A `basic_string` object whose content is equal to the `basic_stringbuf` underlying character sequence. If the `basic_stringbuf` was created only in input mode, the resultant `basic_string` contains the character sequence in the range `[eback(), egptr())`. If the `basic_stringbuf` was created with `which & ios_base::out` being true then the resultant `basic_string` contains the character sequence in the range `[pbase(), high_mark)`, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` with a `basic_string`, or by calling the `str(basic_string)` member function. In the case of calling the `str(basic_string)` member function, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`). Otherwise the `basic_stringbuf` has been created in neither input nor output mode and a zero length `basic_string` is returned.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

- 2 *Effects:* Copies the content of `s` into the `basic_stringbuf` underlying character sequence and initializes the input and output sequences according to `mode`.
- 3 *Postconditions:* If `mode & ios_base::out` is true, `pbase()` points to the first underlying character and `eptr() >= pbase() + s.size()` holds; in addition, if `mode & ios_base::ate` is true, `pptr() == pbase() + s.size()` holds, otherwise `pptr() == pbase()` is true. If `mode & ios_base::in` is true, `eback()` points to the first underlying character, and both `gptr() == eback()` and `egptr() == eback() + s.size()` hold.

#### 27.8.2.4 Overridden virtual functions

[stringbuf.virtuals]

`int_type underflow();`

- 1 *Returns:* If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

`int_type pbackfail(int_type c = traits::eof());`

- 2 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:
- (2.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.  
Returns: `c`.
- (2.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.  
Returns: `c`.
- (2.3) — If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.  
Returns: `traits::not_eof(c)`.
- 3 *Returns:* `traits::eof()` to indicate failure.
- 4 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

`int_type overflow(int_type c = traits::eof());`

- 5 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:
- (5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.  
Signals success by returning `c`.
- (5.2) — If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.  
Signals success by returning a value other than `traits::eof()`.
- 6 *Remarks:* The function can alter the number of write positions available as a result of any call.
- 7 *Returns:* `traits::eof()` to indicate failure.
- 8 The function can make a write position available only if `(mode & ios_base::out) != 0`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `(mode & ios_base::in) != 0`, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

- 9 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 138.

Table 138 — seekoff positioning

| Conditions                                                                                                                                     | Result                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| (which & ios_base::in) == ios_-,<br>base::in                                                                                                   | positions the input sequence                      |
| (which & ios_base::out) == ios_-,<br>base::out                                                                                                 | positions the output sequence                     |
| (which & (ios_base::in  <br>ios_base::out)) ==<br>(ios_base::in  <br>ios_base::out))<br>and way == either<br>ios_base::beg or<br>ios_base::end | positions both the input and the output sequences |
| Otherwise                                                                                                                                      | the positioning operation fails.                  |

- 10 For a sequence to be positioned, if its next pointer (either `gptr()` or `pptr()`) is a null pointer and the new offset `newoff` is nonzero, the positioning operation fails. Otherwise, the function determines `newoff` as indicated in Table 139.

Table 139 — newoff values

| Condition            | newoff Value                                                                         |
|----------------------|--------------------------------------------------------------------------------------|
| way == ios_base::beg | 0                                                                                    |
| way == ios_base::cur | the next pointer minus the beginning pointer ( <code>xnext - xbeg</code> ).          |
| way == ios_base::end | the high mark pointer minus the beginning pointer ( <code>high_mark - xbeg</code> ). |

- 11 If (`newoff + off`) < 0, or if `newoff + off` refers to an uninitialized character (as defined in 27.8.2.3 paragraph 1), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.
- 12 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

- 13 *Effects:* Equivalent to `seekoff(off_type(sp), ios_base::beg, which)`.
- 14 *Returns:* `sp` to indicate success, or `pos_type(off_type(-1))` to indicate failure.

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n);
```

15 *Effects:* implementation-defined, except that `setbuf(0, 0)` has no effect.

16 *Returns:* this.

### 27.8.3 Class template `basic_istream`

[istreamstream]

```
namespace std {
    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
    class basic_istream
    : public basic_istream<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;
        typedef Allocator        allocator_type;

        // 27.8.3.1, constructors:
        explicit basic_istream(
            ios_base::openmode which = ios_base::in);
        explicit basic_istream(
            const basic_string<charT, traits, Allocator>& str,
            ios_base::openmode which = ios_base::in);
        basic_istream(const basic_istream& rhs) = delete;
        basic_istream(basic_istream&& rhs);

        // 27.8.3.2, assign and swap:
        basic_istream& operator=(const basic_istream& rhs) = delete;
        basic_istream& operator=(basic_istream&& rhs);
        void swap(basic_istream& rhs);

        // 27.8.3.3, members:
        basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

        basic_string<charT, traits, Allocator> str() const;
        void str(const basic_string<charT, traits, Allocator>& s);
    private:
        basic_stringbuf<charT, traits, Allocator> sb; // exposition only
    };

    template <class charT, class traits, class Allocator>
    void swap(basic_istream<charT, traits, Allocator>& x,
              basic_istream<charT, traits, Allocator>& y);
}
```

<sup>1</sup> The class `basic_istream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

#### 27.8.3.1 `basic_istream` constructors

[istreamstream.cons]

```
explicit basic_istream(ios_base::openmode which = ios_base::in);
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_istreamstream<charT, traits>`, initializing the base class with `basic_istream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (27.8.2.1).

```
explicit basic_istreamstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::in);
```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_istreamstream<charT, traits>`, initializing the base class with `basic_istream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::in)` (27.8.2.1).

```
basic_istreamstream(basic_istreamstream&& rhs);
```

- <sup>3</sup> *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Next `basic_istream<charT, traits>::set_rdbuf(&sb)` is called to install the contained `basic_stringbuf`.

### 27.8.3.2 Assign and swap

[istreamstream.assign]

```
basic_istreamstream& operator=(basic_istreamstream&& rhs);
```

- <sup>1</sup> *Effects:* Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

- <sup>2</sup> *Returns:* `*this`.

```
void swap(basic_istreamstream& rhs);
```

- <sup>3</sup> *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template <class charT, class traits, class Allocator>
    void swap(basic_istreamstream<charT, traits, Allocator>& x,
              basic_istreamstream<charT, traits, Allocator>& y);
```

- <sup>4</sup> *Effects:* As if by `x.swap(y)`.

### 27.8.3.3 Member functions

[istreamstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

- <sup>1</sup> *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(&sb)`.

```
basic_string<charT, traits, Allocator> str() const;
```

- <sup>2</sup> *Returns:* `rdbuf()->str()`.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

- <sup>3</sup> *Effects:* Calls `rdbuf()->str(s)`.

## 27.8.4 Class template `basic_ostringstream`

[ostreamstream]

```
namespace std {
    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
        class basic_ostringstream
        : public basic_ostream<charT, traits> {
        public:
            typedef charT                char_type;
```

```

typedef typename traits::int_type int_type;
typedef typename traits::pos_type pos_type;
typedef typename traits::off_type off_type;
typedef traits traits_type;
typedef Allocator allocator_type;

// 27.8.4.1, constructors:
explicit basic_ostringstream(
    ios_base::openmode which = ios_base::out);
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out);
basic_ostringstream(const basic_ostringstream& rhs) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

// 27.8.4.2, assign and swap:
basic_ostringstream& operator=(const basic_ostringstream& rhs) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);
void swap(basic_ostringstream& rhs);

// 27.8.4.3, members:
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const;
void str(const basic_string<charT, traits, Allocator>& s);
private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

template <class charT, class traits, class Allocator>
    void swap(basic_ostringstream<charT, traits, Allocator>& x,
              basic_ostringstream<charT, traits, Allocator>& y);
}

```

- <sup>1</sup> The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

#### 27.8.4.1 `basic_ostringstream` constructors

[`ostringstream.cons`]

```

explicit basic_ostringstream(
    ios_base::openmode which = ios_base::out);

```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_ostringstream`, initializing the base class with `basic_ostream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (27.8.2.1).

```

explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out);

```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_ostringstream<charT, traits>`, initializing the base class with `basic_ostream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::out)` (27.8.2.1).

```
basic_ostringstream(basic_ostringstream&& rhs);
```

- 3     *Effects:* Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic\_stringbuf. Next basic\_ostream<charT, traits>::set\_rdbuf(&sb) is called to install the contained basic\_stringbuf.

#### 27.8.4.2 Assign and swap

[ostream.assign]

```
basic_ostringstream& operator=(basic_ostringstream&& rhs);
```

- 1     *Effects:* Move assigns the base and members of \*this from the base and corresponding members of rhs.
- 2     *Returns:* \*this.

```
void swap(basic_ostringstream& rhs);
```

- 3     *Effects:* Exchanges the state of \*this and rhs by calling basic\_ostream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

```
template <class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
         basic_ostringstream<charT, traits, Allocator>& y);
```

- 4     *Effects:* As if by x.swap(y).

#### 27.8.4.3 Member functions

[ostream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

- 1     *Returns:* const\_cast<basic\_stringbuf<charT, traits, Allocator>\*>(&sb).

```
basic_string<charT, traits, Allocator> str() const;
```

- 2     *Returns:* rdbuf()->str().

```
void str(const basic_string<charT, traits, Allocator>& s);
```

- 3     *Effects:* Calls rdbuf()->str(s).

#### 27.8.5 Class template basic\_stringstream

[stringstream]

```
namespace std {
    template <class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT> >
    class basic_stringstream
    : public basic_istream<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;
        typedef Allocator       allocator_type;

        // 27.8.5.1, constructors:
        explicit basic_stringstream(
            ios_base::openmode which = ios_base::out | ios_base::in);
        explicit basic_stringstream(
            const basic_string<charT, traits, Allocator>& str,
```

```

        ios_base::openmode which = ios_base::out | ios_base::in);
        basic_stringstream(const basic_stringstream& rhs) = delete;
        basic_stringstream(basic_stringstream&& rhs);

// 27.8.5.2, assign and swap:
        basic_stringstream& operator=(const basic_stringstream& rhs) = delete;
        basic_stringstream& operator=(basic_stringstream&& rhs);
        void swap(basic_stringstream& rhs);

// 27.8.3.3, members:
        basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
        basic_string<charT, traits, Allocator> str() const;
        void str(const basic_string<charT, traits, Allocator>& str);

private:
        basic_stringbuf<charT, traits> sb; // exposition only
};

template <class charT, class traits, class Allocator>
        void swap(basic_stringstream<charT, traits, Allocator>& x,
                  basic_stringstream<charT, traits, Allocator>& y);
}

```

- <sup>1</sup> The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

(1.1) — `sb`, the `stringbuf` object.

### 27.8.5.1 `basic_stringstream` constructors

[stringstream.cons]

```

explicit basic_stringstream(
    ios_base::openmode which = ios_base::out | ios_base::in);

```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_stringstream<charT, traits>`, initializing the base class with `basic_istream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

```

explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out | ios_base::in);

```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_stringstream<charT, traits>`, initializing the base class with `basic_istream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which)`.

```

basic_stringstream(basic_stringstream&& rhs);

```

- <sup>3</sup> *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Next `basic_istream<charT, traits>::set_rdbuf(&sb)` is called to install the contained `basic_stringbuf`.

### 27.8.5.2 Assign and swap

[stringstream.assign]

```

basic_stringstream& operator=(basic_stringstream&& rhs);

```

1 *Effects:* Move assigns the base and members of *\*this* from the base and corresponding members of *rhs*.

2 *Returns:* *\*this*.

```
void swap(basic_stringstream& rhs);
```

3 *Effects:* Exchanges the state of *\*this* and *rhs* by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template <class charT, class traits, class Allocator>
    void swap(basic_stringstream<charT, traits, Allocator>& x,
              basic_stringstream<charT, traits, Allocator>& y);
```

4 *Effects:* As if by `x.swap(y)`.

### 27.8.5.3 Member functions

[stringstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(&sb)`

```
basic_string<charT, traits, Allocator> str() const;
```

2 *Returns:* `rdbuf()->str()`.

```
void str(const basic_string<charT, traits, Allocator>& str);
```

3 *Effects:* Calls `rdbuf()->str(str)`.

## 27.9 File-based streams

[file.streams]

### 27.9.1 Overview

[fstreams]

1 The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

#### Header `<fstream>` synopsis

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
        class basic_filebuf;
    typedef basic_filebuf<char>    filebuf;
    typedef basic_filebuf<wchar_t> wfilebuf;

    template <class charT, class traits = char_traits<charT> >
        class basic_ifstream;
    typedef basic_ifstream<char>    ifstream;
    typedef basic_ifstream<wchar_t> wifstream;

    template <class charT, class traits = char_traits<charT> >
        class basic_ofstream;
    typedef basic_ofstream<char>    ofstream;
    typedef basic_ofstream<wchar_t> wofstream;

    template <class charT, class traits = char_traits<charT> >
        class basic_fstream;
    typedef basic_fstream<char>    fstream;
    typedef basic_fstream<wchar_t> wfstream;
}
```

- <sup>2</sup> [ *Note*: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. — *end note* ]

## 27.9.2 Class template `basic_filebuf`

[filebuf]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_filebuf
        : public basic_streambuf<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;

        // 27.9.2.1, constructors/destructor:
        basic_filebuf();
        basic_filebuf(const basic_filebuf& rhs) = delete;
        basic_filebuf(basic_filebuf&& rhs);
        virtual ~basic_filebuf();

        // 27.9.2.2, assign and swap:
        basic_filebuf& operator=(const basic_filebuf& rhs) = delete;
        basic_filebuf& operator=(basic_filebuf&& rhs);
        void swap(basic_filebuf& rhs);

        // 27.9.2.3, members:
        bool is_open() const;
        basic_filebuf<charT, traits>* open(const char* s,
                                           ios_base::openmode mode);
        basic_filebuf<charT, traits>* open(const string& s,
                                           ios_base::openmode mode);
        basic_filebuf<charT, traits>* close();

    protected:
        // 27.9.2.4, overridden virtual functions:
        virtual streamsize showmanyc();
        virtual int_type underflow();
        virtual int_type uflow();
        virtual int_type pbackfail(int_type c = traits::eof());
        virtual int_type overflow (int_type c = traits::eof());

        virtual basic_streambuf<charT, traits>* setbuf(char_type* s,
                                                       streamsize n);
        virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);
        virtual pos_type seekpos(pos_type sp,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);

        virtual int      sync();
        virtual void     imbue(const locale& loc);
    };
}
```

```

    template <class charT, class traits>
    void swap(basic_filebuf<charT, traits>& x,
              basic_filebuf<charT, traits>& y);
}

```

- 1 The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.
- 2 The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the Standard C library `FILES`.
- 3 In particular:
  - (3.1) — If the file is not open for reading the input sequence cannot be read.
  - (3.2) — If the file is not open for writing the output sequence cannot be written.
  - (3.3) — A joint file position is maintained for both the input sequence and the output sequence.
- 4 An instance of `basic_filebuf` behaves as described in 27.9.2 provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.
- 5 In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following sections, obtained as if by

```

const codecvt<charT, char, typename traits::state_type>& a_codecvt =
    use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());

```

### 27.9.2.1 `basic_filebuf` constructors

[filebuf.cons]

```
basic_filebuf();
```

- 1 *Effects:* Constructs an object of class `basic_filebuf<charT, traits>`, initializing the base class with `basic_streambuf<charT, traits>()` (27.6.3.1).

- 2 *Postcondition:* `is_open() == false`.

```
basic_filebuf(basic_filebuf&& rhs);
```

- 3 *Effects:* Move constructs from the rvalue `rhs`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The openmode, locale and any other state of `rhs` is also copied.
- 4 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.
  - (4.1) — `is_open() == rhs_p.is_open()`
  - (4.2) — `rhs_a.is_open() == false`
  - (4.3) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
  - (4.4) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
  - (4.5) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
  - (4.6) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
  - (4.7) — `if (eback()) eback() != rhs_a.eback()`
  - (4.8) — `if (gptr()) gptr() != rhs_a.gptr()`
  - (4.9) — `if (egptr()) egptr() != rhs_a.egptr()`

- (4.10) — if (pbase()) pbase() != rhs\_a.pbase()  
 (4.11) — if (pptr()) pptr() != rhs\_a.pptr()  
 (4.12) — if (epptr()) epptr() != rhs\_a.epptr()

virtual ~basic\_filebuf();

- 5 *Effects:* Destroys an object of class `basic_filebuf<charT, traits>`. Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see 17.6.5.12).

### 27.9.2.2 Assign and swap

[filebuf.assign]

`basic_filebuf& operator=(basic_filebuf&& rhs);`

- 1 *Effects:* Calls `this->close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 27.9.2.1).  
 2 *Returns:* `*this`.

`void swap(basic_filebuf& rhs);`

- 3 *Effects:* Exchanges the state of `*this` and `rhs`.

```
template <class charT, class traits>
void swap(basic_filebuf<charT, traits>& x,
         basic_filebuf<charT, traits>& y);
```

- 4 *Effects:* As if by `x.swap(y)`.

### 27.9.2.3 Member functions

[filebuf.members]

`bool is_open() const;`

- 1 *Returns:* `true` if a previous call to `open` succeeded (returned a non-null value) and there has been no intervening call to `close`.

```
basic_filebuf<charT, traits>* open(const char* s,
                                ios_base::openmode mode);
```

- 2 *Effects:* If `is_open() != false`, returns a null pointer. Otherwise, initializes the `filebuf` as required. It then opens a file, if possible, whose name is the NTBS `s` (as if by calling `std::fopen(s, modstr)`). The NTBS `modstr` is determined from `mode & ~ios_base::ate` as indicated in Table 140. If `mode` is not some combination of flags shown in the table then the open fails.  
 3 If the open operation succeeds and `(mode & ios_base::ate) != 0`, positions the file to the end (as if by calling `std::fseek(file, 0, SEEK_END)`).<sup>335</sup>  
 4 If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.  
 5 *Returns:* `this` if successful, a null pointer otherwise.

```
basic_filebuf<charT, traits>* open(const string& s,
                                ios_base::openmode mode);
```

*Returns:* `open(s.c_str(), mode);`

`basic_filebuf<charT, traits>* close();`

<sup>335</sup> The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<cstdio>` (27.11).

Table 140 — File open modes

| ios_base flag combination |    |     |       |     | stdio equivalent |
|---------------------------|----|-----|-------|-----|------------------|
| binary                    | in | out | trunc | app |                  |
|                           |    | +   |       |     | "w"              |
|                           |    | +   |       | +   | "a"              |
|                           |    |     |       | +   | "a"              |
|                           |    | +   | +     |     | "w"              |
|                           | +  |     |       |     | "r"              |
|                           | +  | +   |       |     | "r+"             |
|                           | +  | +   | +     |     | "w+"             |
|                           | +  | +   |       | +   | "a+"             |
|                           | +  |     |       | +   | "a+"             |
| +                         |    | +   |       |     | "wb"             |
| +                         |    | +   |       | +   | "ab"             |
| +                         |    |     |       | +   | "ab"             |
| +                         |    | +   | +     |     | "wb"             |
| +                         | +  |     |       |     | "rb"             |
| +                         | +  | +   |       |     | "r+b"            |
| +                         | +  | +   | +     |     | "w+b"            |
| +                         | +  | +   |       | +   | "a+b"            |
| +                         | +  |     |       | +   | "a+b"            |

6 *Effects:* If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(trait::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(trait::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

7 *Returns:* `this` on success, a null pointer otherwise.

8 *Postcondition:* `is_open() == false`.

#### 27.9.2.4 Overridden virtual functions

[filebuf.virtuals]

```
streamsize showmanyc();
```

1 *Effects:* Behaves the same as `basic_streambuf::showmanyc()` (27.6.3.4).

2 *Remarks:* An implementation might well provide an overriding definition for this function signature if it can determine that more characters can be read from the input sequence.

```
int_type underflow();
```

3 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer ( `extern_buf`) and then as if by doing:

```
char    extern_buf[XSIZE];
char*   extern_end;
charT   intern_buf[ISIZE];
```

```

charT* intern_end;
codecvt_base::result r =
    a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
                intern_buf, intern_buf+ISIZE, intern_end);

```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

```
int_type uflow();
```

- 4 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

```
int_type pbackfail(int_type c = traits::eof());
```

- 5 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- (5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.  
Returns: `c`.
- (5.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.  
Returns: `c`.
- (5.3) — If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.  
Returns: `traits::not_eof(c)`.

6 *Returns:* `traits::eof()` to indicate failure.

7 *Remarks:* If `is_open() == false`, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type overflow(int_type c = traits::eof());
```

- 10 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```

charT* b = pbase();
charT* p = pptr();
charT* end;
char  xbuf[XSIZE];
char*  xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);

```

and then

- (10.1) — If `r == codecvt_base::error` then fail.

- (10.2) — If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.
- (10.3) — If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).
- (10.4) — Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end` (`xbuf` isn't large enough) then increase `XSIZE` and repeat from the beginning.

11 *Returns:* `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

```
basic_streambuf* setbuf(char_type* s, streamsize n);
```

12 *Effects:* If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

13 *Effects:* Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call `std::fseek(file, width * off, whence)`, otherwise call `std::fseek(file, 0, whence)`.

14 *Remarks:* “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if `width` is less than zero then call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in Table 141.

Table 141 — seekoff effects

| way                         | Value | stdio Equivalent      |
|-----------------------------|-------|-----------------------|
| <code>basic_ios::beg</code> |       | <code>SEEK_SET</code> |
| <code>basic_ios::cur</code> |       | <code>SEEK_CUR</code> |
| <code>basic_ios::end</code> |       | <code>SEEK_END</code> |

15 *Returns:* A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

16 Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:

1. if `(om & ios_base::out) != 0`, then update the output sequence and write any unshift sequence;
2. set the file position to `sp` as if by a call to `fsetpos`;
3. if `(om & ios_base::in) != 0`, then update the input sequence;

where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns false.

17 If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.

18 *Returns:* `sp` on success. Otherwise returns `pos_type(off_type(-1))`.

```
int sync();
```

19 *Effects:* If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.

```
void imbue(const locale& loc);
```

20 *Requires:* If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent (22.4.1.4.2) then that facet is the same as the corresponding facet of `loc`.

21 *Effects:* Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.

22 *Remark:* This may require reversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

### 27.9.3 Class template `basic_ifstream`

[`ifstream`]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_ifstream
    : public basic_istream<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;

        // 27.9.3.1, constructors:
        basic_ifstream();
        explicit basic_ifstream(const char* s,
                               ios_base::openmode mode = ios_base::in);
        explicit basic_ifstream(const string& s,
                               ios_base::openmode mode = ios_base::in);
        basic_ifstream(const basic_ifstream& rhs) = delete;
        basic_ifstream(basic_ifstream&& rhs);

        // 27.9.3.2, assign and swap:
        basic_ifstream& operator=(const basic_ifstream& rhs) = delete;
        basic_ifstream& operator=(basic_ifstream&& rhs);
        void swap(basic_ifstream& rhs);

        // 27.9.3.3, members:
        basic_filebuf<charT, traits>* rdbuf() const;

        bool is_open() const;
        void open(const char* s, ios_base::openmode mode = ios_base::in);
```

```

    void open(const string& s, ios_base::openmode mode = ios_base::in);
    void close();
private:
    basic_filebuf<charT, traits> sb; // exposition only
};

template <class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x,
              basic_ifstream<charT, traits>& y);
}

```

- <sup>1</sup> The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the filebuf object.

### 27.9.3.1 `basic_ifstream` constructors

[ifstream.cons]

```
basic_ifstream();
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_ifstream<charT, traits>`, initializing the base class with `basic_istream(&sb)` and initializing `sb` with `basic_filebuf<charT, traits>()` (27.7.2.1.1, 27.9.2.1).

```
explicit basic_ifstream(const char* s,
                       ios_base::openmode mode = ios_base::in);
```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_ifstream`, initializing the base class with `basic_istream(&sb)` and initializing `sb` with `basic_filebuf<charT, traits>()` (27.7.2.1.1, 27.9.2.1), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ifstream(const string& s,
                       ios_base::openmode mode = ios_base::in);
```

- <sup>3</sup> *Effects:* The same as `basic_ifstream(s.c_str(), mode)`.

```
basic_ifstream(basic_ifstream&& rhs);
```

- <sup>4</sup> *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_filebuf`. Next `basic_istream<charT, traits>::set_rdbuf(&sb)` is called to install the contained `basic_filebuf`.

### 27.9.3.2 Assign and swap

[ifstream.assign]

```
basic_ifstream& operator=(basic_ifstream&& rhs);
```

- <sup>1</sup> *Effects:* Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

- <sup>2</sup> *Returns:* `*this`.

```
void swap(basic_ifstream& rhs);
```

- <sup>3</sup> *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template <class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x,
              basic_ifstream<charT, traits>& y);
```

4     *Effects:* As if by `x.swap(y)`.

### 27.9.3.3 Member functions

[ifstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1     *Returns:* `const_cast<basic_filebuf<charT, traits>*>(&sb)`.

```
bool is_open() const;
```

2     *Returns:* `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::in);
```

3     *Effects:* Calls `rdbuf()->open(s, mode | ios_base::in)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) ([27.5.5.4](#)).

```
void open(const string& s, ios_base::openmode mode = ios_base::in);
```

4     *Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

5     *Effects:* Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) ([27.5.5.4](#)).

### 27.9.4 Class template `basic_ofstream`

[ofstream]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_ofstream
    : public basic_ostream<charT, traits> {
    public:
        typedef charT          char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits          traits_type;

        // 27.9.4.1, constructors:
        basic_ofstream();
        explicit basic_ofstream(const char* s,
                               ios_base::openmode mode = ios_base::out);
        explicit basic_ofstream(const string& s,
                               ios_base::openmode mode = ios_base::out);
        basic_ofstream(const basic_ofstream& rhs) = delete;
        basic_ofstream(basic_ofstream&& rhs);

        // 27.9.4.2, assign and swap:
        basic_ofstream& operator=(const basic_ofstream& rhs) = delete;
        basic_ofstream& operator=(basic_ofstream&& rhs);
        void swap(basic_ofstream& rhs);

        // 27.9.4.3, members:
```

```

    basic_filebuf<charT, traits>* rdbuf() const;

    bool is_open() const;
    void open(const char* s, ios_base::openmode mode = ios_base::out);
    void open(const string& s, ios_base::openmode mode = ios_base::out);
    void close();
private:
    basic_filebuf<charT, traits> sb; // exposition only
};

template <class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x,
              basic_ofstream<charT, traits>& y);
}

```

- <sup>1</sup> The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the filebuf object.

#### 27.9.4.1 `basic_ofstream` constructors

[ofstream.cons]

```
basic_ofstream();
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_ofstream<charT, traits>`, initializing the base class with `basic_ostream(&sb)` and initializing `sb` with `basic_filebuf<charT, traits>()` (27.7.3.2, 27.9.2.1).

```
explicit basic_ofstream(const char* s,
                      ios_base::openmode mode = ios_base::out);
```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_ofstream<charT, traits>`, initializing the base class with `basic_ostream(&sb)` and initializing `sb` with `basic_filebuf<charT, traits>()` (27.7.3.2, 27.9.2.1), then calls `rdbuf()->open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ofstream(const string& s,
                      ios_base::openmode mode = ios_base::out);
```

- <sup>3</sup> *Effects:* The same as `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
```

- <sup>4</sup> *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_filebuf`. Next `basic_ostream<charT, traits>::set_rdbuf(&sb)` is called to install the contained `basic_filebuf`.

#### 27.9.4.2 Assign and swap

[ofstream.assign]

```
basic_ofstream& operator=(basic_ofstream&& rhs);
```

- <sup>1</sup> *Effects:* Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

- <sup>2</sup> *Returns:* `*this`.

```
void swap(basic_ofstream& rhs);
```

- <sup>3</sup> *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_ostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template <class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x,
              basic_ofstream<charT, traits>& y);
```

4     *Effects:* As if by `x.swap(y)`.

### 27.9.4.3 Member functions

[ofstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1     *Returns:* `const_cast<basic_filebuf<charT, traits>*>(&sb)`.

```
bool is_open() const;
```

2     *Returns:* `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::out);
```

3     *Effects:* Calls `rdbuf()->open(s, mode | ios_base::out)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (27.5.5.4).

```
void close();
```

4     *Effects:* Calls `rdbuf()->close()` and, if that function fails (returns a null pointer), calls `setstate(failbit)` (which may throw `ios_base::failure`) (27.5.5.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::out);
```

5     *Effects:* Calls `open(s.c_str(), mode)`.

### 27.9.5 Class template basic\_fstream

[fstream]

```
namespace std {
    template <class charT, class traits = char_traits<charT> >
    class basic_fstream
    : public basic_iostream<charT, traits> {
    public:
        typedef charT                char_type;
        typedef typename traits::int_type int_type;
        typedef typename traits::pos_type pos_type;
        typedef typename traits::off_type off_type;
        typedef traits                traits_type;

        // 27.9.5.1, constructors:
        basic_fstream();
        explicit basic_fstream(
            const char* s,
            ios_base::openmode mode = ios_base::in | ios_base::out);
        explicit basic_fstream(
            const string& s,
            ios_base::openmode mode = ios_base::in | ios_base::out);
        basic_fstream(const basic_fstream& rhs) = delete;
        basic_fstream(basic_fstream&& rhs);

        // 27.9.5.2, assign and swap:
        basic_fstream& operator=(const basic_fstream& rhs) = delete;
        basic_fstream& operator=(basic_fstream&& rhs);
        void swap(basic_fstream& rhs);
```

```

// 27.9.5.3, members:
basic_filebuf<charT, traits>* rdbuf() const;
bool is_open() const;
void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void close();

private:
    basic_filebuf<charT, traits> sb; // exposition only
};

template <class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
          basic_fstream<charT, traits>& y);
}

```

- <sup>1</sup> The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `basic_filebuf` object.

#### 27.9.5.1 `basic_fstream` constructors

[fstream.cons]

```
basic_fstream();
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_fstream<charT, traits>`, initializing the base class with `basic_iostream(&sb)` and initializing `sb` with `basic_filebuf<charT, traits>()`.

```
explicit basic_fstream(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

- <sup>2</sup> *Effects:* Constructs an object of class `basic_fstream<charT, traits>`, initializing the base class with `basic_iostream(&sb)` and initializing `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_fstream(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

- <sup>3</sup> *Effects:* The same as `basic_fstream(s.c_str(), mode)`.

```
basic_fstream(basic_fstream&& rhs);
```

- <sup>4</sup> *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_filebuf`. Next `basic_istream<charT, traits>::set_rdbuf(&sb)` is called to install the contained `basic_filebuf`.

#### 27.9.5.2 Assign and swap

[fstream.assign]

```
basic_fstream& operator=(basic_fstream&& rhs);
```

1 *Effects:* Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

2 *Returns:* `*this`.

```
void swap(basic_fstream& rhs);
```

3 *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template <class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
         basic_fstream<charT, traits>& y);
```

4 *Effects:* As if by `x.swap(y)`.

### 27.9.5.3 Member functions

[fstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

1 *Returns:* `const_cast<basic_filebuf<charT, traits>*>(&sb)`.

```
bool is_open() const;
```

2 *Returns:* `rdbuf()->is_open()`.

```
void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

3 *Effects:* Calls `rdbuf()->open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (27.5.5.4).

```
void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

4 *Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

5 *Effects:* Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (27.5.5.4).

## 27.10 File systems

[filesystems]

### 27.10.1 General

[fs.general]

1 This sub-clause describes operations on file systems and their components, such as paths, regular files, and directories.

### 27.10.2 Conformance

[fs.conformance]

1 Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance sub-clauses take that into account.

### 27.10.2.1 POSIX conformance [fs.conform.9945]

- <sup>1</sup> Some behavior is specified by reference to POSIX (27.10.3). How such behavior is actually implemented is unspecified. [ *Note*: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — *end note* ]
- <sup>2</sup> Implementations are encouraged to provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior are encouraged to provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 27.10.7. [ *Note*: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — *end note* ]
- <sup>3</sup> Implementations are not required to provide behavior that is not supported by a particular file system. [ *Example*: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system. — *end example* ]

### 27.10.2.2 Operating system dependent behavior conformance [fs.conform.os]

- <sup>1</sup> Some behavior is specified as being operating system dependent (27.10.4.13). The operating system an implementation is dependent upon is implementation-defined.
- <sup>2</sup> It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

### 27.10.2.3 File system race behavior [fs.race.behavior]

- <sup>1</sup> Behavior is undefined if calls to functions provided by this sub-clause introduce a file system race (27.10.4.6).
- <sup>2</sup> If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, *Requires*: is not specified for the function. [ *Note*: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — *end note* ]

## 27.10.3 Normative references [fs.norm.ref]

- <sup>1</sup> This sub-clause mentions commercially available operating systems for purposes of exposition.<sup>336</sup>

## 27.10.4 Terms and definitions [fs.definitions]

### 27.10.4.1 [fs.def.absolute.path]

#### absolute path

A path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent.

### 27.10.4.2 [fs.def.canonical.path]

#### canonical path

An absolute path that has no elements that are symbolic links, and no *dot* or *dot-dot* elements (27.10.8.1).

### 27.10.4.3 [fs.def.directory]

#### directory

A file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files.

<sup>336</sup>) POSIX® is a registered trademark of The IEEE. MAC OS® is a registered trademark of Apple Inc. Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of these products.

#### **27.10.4.4** [fs.def.file] **file**

An object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links (27.10.4.20), may be supported by the implementation.

#### **27.10.4.5** [fs.def.filesystem] **file system**

A collection of files and certain of their attributes.

#### **27.10.4.6** [fs.def.race] **file system race**

The condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system.

#### **27.10.4.7** [fs.def.filename] **filename**

The name of a file. Filenames *dot* and *dot-dot* have special meaning. The following characteristics of filenames are operating system dependent:

- The permitted characters. [*Example:* Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — *end example*].
- The maximum permitted length.
- Filenames that are not permitted.
- Filenames that have special meaning.
- Case awareness and sensitivity during path resolution.
- Special rules that may apply to file types other than regular files, such as directories.

#### **27.10.4.8** [fs.def.hardlink] **hard link**

A link (27.10.4.9) to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed. [*Note:* A hard link can be thought of as a shared-ownership smart pointer to a file. — *end note*]

#### **27.10.4.9** [fs.def.link] **link**

A directory entry that associates a filename with a file. A link is either a hard link (27.10.4.8) or a symbolic link (27.10.4.20).

#### **27.10.4.10** [fs.def.native.encode] **native encoding**

For narrow character strings, the operating system dependent current encoding for pathnames (27.10.4.17). For wide character strings, the implementation defined execution wide-character set encoding (2.3).

#### **27.10.4.11** [fs.def.native] **native pathname format**

The operating system dependent pathname format accepted by the host operating system.

#### 27.10.4.12 [fs.def.ntcts] NTCTS

Acronym for “null-terminated character-type sequence”. Describes a sequence of values of a given encoded character type terminated by that type’s null character. If the encoded character type is `EcharT`, the null character can be constructed by `EcharT()`.

#### 27.10.4.13 [fs.def.osdep] operating system dependent behavior

Behavior that is dependent upon the behavior and characteristics of an operating system. See 27.10.2.2.

#### 27.10.4.14 [fs.def.parent] parent directory

⟨of a directory⟩ the directory that both contains a directory entry for the given directory and is represented by the filename *dot-dot* in the given directory. [ *Note:* Does not apply to *dot* and *dot-dot*. — *end note* ]

#### 27.10.4.15 [fs.def.parent.other] parent directory

⟨of other types of files⟩ a directory containing a directory entry for the file under discussion.

#### 27.10.4.16 [fs.def.path] path

A sequence of elements that identify the location of a file within a filesystem. The elements are the *root-name<sub>opt</sub>*, *root-directory<sub>opt</sub>*, and an optional sequence of filenames. The maximum number of elements in the sequence is operating system dependent.

#### 27.10.4.17 [fs.def.pathname] pathname

A character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (27.10.8.1) or an operating system dependent native pathname format.

#### 27.10.4.18 [fs.def.pathres] pathname resolution

Pathname resolution is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file. [ *Example:* POSIX specifies the mechanism in section 4.11, Pathname resolution. — *end example* ]

#### 27.10.4.19 [fs.def.relative-path] relative path

A path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent. [ *Note:* Pathnames “.” and “..” are relative paths. — *end note* ]

#### 27.10.4.20 [fs.def.symlink] symbolic link

A type of file with the property that when the file is encountered during pathname resolution, a string stored by the file is used to modify the pathname resolution. [ *Note:* Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — *end note* ]

### 27.10.5 Requirements [fs.req]

- <sup>1</sup> Throughout this sub-clause, `char`, `wchar_t`, `char16_t`, and `char32_t` are collectively called *encoded character types*.
- <sup>2</sup> Template parameters named `EcharT` shall be one of the encoded character types.

- 3 Template parameters named `InputIterator` shall meet the input iterator requirements (24.2.3) and shall have a value type that is one of the encoded character types.
- 4 [ *Note:* Use of an encoded character type implies an associated encoding. Since `signed char` and `unsigned char` have no implied encoding, they are not included as permitted types. — *end note* ]
- 5 Template parameters named `Allocator` shall meet the Allocator requirements (17.6.3.5).

### 27.10.5.1 Namespaces and headers

[fs.req.namespace]

- 1 Unless otherwise specified, references to entities described in this sub-clause are assumed to be qualified with `::std::filesystem::`.

### 27.10.6 Header `<filesystem>` synopsis

[fs.filesystem.syn]

```

namespace std::filesystem {
    // 27.10.8, paths:
    class path;

    // 27.10.8.6, path non-member functions:
    void swap(path& lhs, path& rhs) noexcept;
    size_t hash_value(const path& p) noexcept;

    bool operator==(const path& lhs, const path& rhs) noexcept;
    bool operator!=(const path& lhs, const path& rhs) noexcept;
    bool operator< (const path& lhs, const path& rhs) noexcept;
    bool operator<=(const path& lhs, const path& rhs) noexcept;
    bool operator> (const path& lhs, const path& rhs) noexcept;
    bool operator>=(const path& lhs, const path& rhs) noexcept;

    path operator/ (const path& lhs, const path& rhs);

    // 27.10.8.6.1, path inserter and extractor:

path temp_directory_path(error_code& ec);
}

```

- <sup>1</sup> *trivial-clock* is an implementation-defined type that satisfies the `TrivialClock` requirements (20.15.3) and that is capable of representing and measuring file time values. Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

### 27.10.7 Error reporting

[fs.err.report]

- <sup>1</sup> Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`. [Note: This supports two common use cases:
- (1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.
  - (1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.
- end note]
- <sup>2</sup> Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:
- (2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.
  - (2.2) — Failure to allocate storage is reported by throwing an exception as described in 17.6.5.12.
  - (2.3) — Destructors throw nothing.
- <sup>3</sup> Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:
- (3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

### 27.10.8 Class path

[class.path]

- <sup>1</sup> An object of class `path` represents a path (27.10.4.16) and contains a pathname (27.10.4.17). Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

```
namespace std::filesystem {
    class path {
    public:
        typedef see below value_type;
        typedef basic_string<value_type> string_type;
        static constexpr value_type preferred_separator = see below;

        // 27.10.8.4.1, constructors and destructor:
```

```

path() noexcept;
path(const path& p);
path(path&& p) noexcept;
template <class Source>
    path(const Source& source);
template <class InputIterator>
    path(InputIterator first, InputIterator last);
template <class Source>
    path(const Source& source, const locale& loc);
template <class InputIterator>
    path(InputIterator first, InputIterator last, const locale& loc);
~path();

```

*// 27.10.8.4.2, assignments:*

```

path& operator=(const path& p);
path& operator=(path&& p) noexcept;
template <class Source>
    path& operator=(const Source& source);
template <class Source>
    path& assign(const Source& source)
template <class InputIterator>
    path& assign(InputIterator first, InputIterator last);

```

*// 27.10.8.4.3, appends:*

```

path& operator/=(const path& p);
template <class Source>
    path& operator/=(const Source& source);
template <class Source>
    path& append(const Source& source);
template <class InputIterator>
    path& append(InputIterator first, InputIterator last);

```

*// 27.10.8.4.4, concatenation:*

```

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(const value_type* x);
path& operator+=(value_type x);
template <class Source>
    path& operator+=(const Source& x);
template <class EcharT>
    path& operator+=(EcharT x);
template <class Source>
    path& concat(const Source& x);
template <class InputIterator>
    path& concat(InputIterator first, InputIterator last);

```

*// 27.10.8.4.5, modifiers:*

```

void clear() noexcept;
path& make_preferred();
path& remove_filename();
path& replace_filename(const path& replacement);
path& replace_extension(const path& replacement = path());
void swap(path& rhs) noexcept;

```

*// 27.10.8.4.6, native format observers:*

```

const string_type& native() const noexcept;
const value_type* c_str() const noexcept;
operator string_type() const;

template <class EcharT, class traits = char_traits<EcharT>,
          class Allocator = allocator<EcharT>>
    basic_string<EcharT, traits, Allocator>
        string(const Allocator& a = Allocator()) const;
std::string      string() const;
std::wstring     wstring() const;
std::string      u8string() const;
std::u16string   u16string() const;
std::u32string   u32string() const;

// 27.10.8.4.7, generic format observers:
template <class EcharT, class traits = char_traits<EcharT>,
          class Allocator = allocator<EcharT>>
    basic_string<EcharT, traits, Allocator>
        generic_string(const Allocator& a = Allocator()) const;
std::string      generic_string() const;
std::wstring     generic_wstring() const;
std::string      generic_u8string() const;
std::u16string   generic_u16string() const;
std::u32string   generic_u32string() const;

// 27.10.8.4.8, compare:
int  compare(const path& p) const noexcept;
int  compare(const string_type& s) const;
int  compare(const value_type* s) const;

// 27.10.8.4.9, decomposition:
path root_name() const;
path root_directory() const;
path root_path() const;
path relative_path() const;
path parent_path() const;
path filename() const;
path stem() const;
path extension() const;

// 27.10.8.4.10, query:
bool empty() const noexcept;
bool has_root_name() const;
bool has_root_directory() const;
bool has_root_path() const;
bool has_relative_path() const;
bool has_parent_path() const;
bool has_filename() const;
bool has_stem() const;
bool has_extension() const;
bool is_absolute() const;
bool is_relative() const;

// 27.10.8.5, iterators:
class iterator;

```

```

typedef iterator const_iterator;

iterator begin() const;
iterator end() const;

private:
    string_type pathname; // exposition only
};
}

```

- <sup>2</sup> `value_type` is a typedef for the operating system dependent encoded character type used to represent pathnames.
- <sup>3</sup> The value of `preferred_separator` is the operating system dependent *preferred-separator* character (27.10.8.1).
- <sup>4</sup> [ *Example:* For POSIX based operating systems, `value_type` is `char` and `preferred_separator` is the slash character ('/'). For Windows based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (L'\'). — *end example* ]

### 27.10.8.1 Generic pathname format

[path.generic]

*pathname:*

*root-name root-directory<sub>opt</sub> relative-path<sub>opt</sub>*  
*root-directory relative-path<sub>opt</sub>*  
*relative-path*

*root-name:*

An operating system dependent name that identifies the starting location for absolute paths. [ *Note:* Many operating systems define a name beginning with two *directory-separator* characters as a *root-name* that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier – a *root-name* identifying a specific device such as a disk drive. — *end note* ]

*root-directory:*

*directory-separator*

*relative-path:*

*filename*  
*relative-path directory-separator*  
*relative-path directory-separator filename*

*filename:*

*name*  
*dot*  
*dot-dot*

*name:*

A sequence of characters other than *directory-separator* characters. [ *Note:* Operating systems often place restrictions on the characters that may be used in a *filename*. For wide portability, users may wish to limit *filename* characters to the POSIX Portable Filename Character Set:  
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
a b c d e f g h i j k l m n o p q r s t u v w x y z  
0 1 2 3 4 5 6 7 8 9 . \_ - — *end note* ]

*dot:*

The filename consisting solely of a single period character (.).

*dot-dot:*

The filename consisting solely of two period characters (..).

*directory-separator:*

*slash*

*slash directory-separator*

*preferred-separator*

*preferred-separator directory-separator*

*preferred-separator:*

An operating system dependent directory separator character. May be a synonym for *slash*.

*slash:*

The slash character (/).

- <sup>1</sup> Multiple successive *directory-separator* characters are considered to be the same as one *directory-separator* character.
- <sup>2</sup> The filename *dot* is treated as a reference to the current directory. The filename *dot-dot* is treated as a reference to the parent directory. What the filename *dot-dot* refers to relative to *root-directory* is implementation-defined. Specific filenames may have special meanings for a particular operating system.

## 27.10.8.2 path conversions

[path.cvt]

### 27.10.8.2.1 path argument format conversions

[path.fmt.cvt]

- <sup>1</sup> [*Note:* The format conversions described in this section are not applied on POSIX or Windows based operating systems because on these systems:

- (1.1) — The generic format is acceptable as a native path.
- (1.2) — There is no need to distinguish between native format and generic format in function arguments.
- (1.3) — Paths for regular files and paths for directories share the same syntax.

— *end note*]

- <sup>2</sup> Function arguments that take character sequences representing paths may use the generic pathname format grammar (27.10.8.1) or the native pathname format (27.10.4.11). If and only if such arguments are in the generic format and the generic format is not acceptable to the operating system as a native path, conversion to native format shall be performed during the processing of the argument.
- <sup>3</sup> [*Note:* Some operating systems may have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — *end note*]
- <sup>4</sup> If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a *directory-separator*, otherwise it shall be treated as a path to a regular file.

### 27.10.8.2.2 path type and encoding conversions

[path.type.cvt]

- <sup>1</sup> For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:
  - (1.1) — **char:** The encoding is the native narrow encoding (27.10.4.10). The method of conversion, if any, is operating system dependent. [*Note:* For POSIX based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows based operating systems, the native narrow encoding is determined by calling a Windows API function. — *end note*] [*Note:* This results in behavior identical to other C and C++ standard library

functions that perform file operations using narrow character strings to identify paths. Changing this behavior would be surprising and error prone. — *end note*]

- (1.2) — **wchar\_t**: The encoding is the native wide encoding (27.10.4.10). The method of conversion method is unspecified. [ *Note*: For Windows based operating systems **path::value\_type** is **wchar\_t** so no conversion from **wchar\_t** value type arguments or to **wchar\_t** value type return values is performed. — *end note* ]
  - (1.3) — **char16\_t**: The encoding is UTF-16. The method of conversion method is unspecified.
  - (1.4) — **char32\_t**: The encoding is UTF-32. The method of conversion method is unspecified.
- <sup>2</sup> If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified.

### 27.10.8.3 path requirements

[path.req]

- <sup>1</sup> In addition to the requirements (27.10.5), function template parameters named **Source** shall be one of:
- (1.1) — **basic\_string<EcharT, traits, Allocator>**. A function argument **const Source& source** shall have an effective range [**source.begin()**, **source.end()**).
  - (1.2) — A type meeting the input iterator requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument **const Source& source** shall have an effective range [**source**, **end**) where **end** is the first iterator value with an element value equal to **iterator\_traits<Source>::value\_type()**.
  - (1.3) — A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument **const Source& source** shall have an effective range [**source**, **end**) where **end** is the first iterator value with an element value equal to **iterator\_traits<decay<Source>::type>::value\_type()**.
- <sup>2</sup> [ *Note*: See path conversions (27.10.8.2) for how the value types above and their encodings convert to **path::value\_type** and its encoding. — *end note* ]
- <sup>3</sup> Arguments of type **Source** shall not be null pointers.

### 27.10.8.4 path members

[path.member]

#### 27.10.8.4.1 path constructors

[path.construct]

**path()** noexcept;

- <sup>1</sup> *Effects*: Constructs an object of class **path**.

- <sup>2</sup> *Postconditions*: **empty() == true**.

**path(const path& p);**  
**path(path&& p)** noexcept;

- <sup>3</sup> *Effects*: Constructs an object of class **path** with **pathname** having the original value of **p.pathname**. In the second form, **p** is left in a valid but unspecified state.

```
template <class Source>
    path(const Source& source);
template <class InputIterator>
    path(InputIterator first, InputIterator last);
```

- 4 *Effects:* Constructs an object of class `path`, storing the effective range of `source` (27.10.8.3) or the range `[first, last)` in `pathname`, converting format and encoding if required (27.10.8.2).

```
template <class Source>
    path(const Source& source, const locale& loc);
template <class InputIterator>
    path(InputIterator first, InputIterator last, const locale& loc);
```

- 5 *Requires:* The value type of `Source` and `InputIterator` is `char`.

- 6 *Effects:* Constructs an object of class `path`, storing the effective range of `source` or the range `[first, last)` in `pathname`, after converting format if required and after converting the encoding as follows:

- (6.1) — If `value_type` is `wchar_t`, converts to the native wide encoding (27.10.4.10) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
- (6.2) — Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current narrow encoding.

[*Example:* A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (27.10.4.10). The resulting wide string is then converted to a narrow character `pathname` string in the current native narrow encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native narrow encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native narrow encodings some characters may have no representation.

For Windows based operating systems, the path is constructed by using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a UTF-16 encoded wide character `pathname` string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation.  
— *end example*]

#### 27.10.8.4.2 path assignments

[`path.assign`]

```
path& operator=(const path& p);
```

- 1 *Effects:* If `*this` and `p` are the same object, has no effect. Otherwise, modifies `pathname` to have the original value of `p.pathname`.

- 2 *Returns:* `*this`.

```
path& operator=(path&& p) noexcept;
```

- 3 *Effects:* If `*this` and `p` are the same object, has no effect. Otherwise, modifies `pathname` to have the original value of `p.pathname`. `p` is left in a valid but unspecified state. [ *Note:* A valid implementation is `swap(p)`. — *end note* ]

- 4 *Returns:* `*this`.

```

template <class Source>
    path& operator=(const Source& source);
template <class Source>
    path& assign(const Source& source);
template <class InputIterator>
    path& assign(InputIterator first, InputIterator last);

```

5       *Effects:* Stores the effective range of `source` (27.10.8.3) or the range `[first, last)` in `pathname`, converting format and encoding if required (27.10.8.2).

6       *Returns:* `*this`.

#### 27.10.8.4.3 path appends

[`path.append`]

1 The append operations use `operator/=` to denote their semantic effect of appending *preferred-separator* when needed.

```

path& operator/=(const path& p);

```

2       *Effects:* Appends `path::preferred_separator` to `pathname` unless:

- (2.1)       — an added *directory-separator* would be redundant, or
- (2.2)       — an added *directory-separator* would change a relative path into an absolute path [ *Note:* An empty path is relative. — *end note* ], or
- (2.3)       — `p.empty()` is true, or
- (2.4)       — `*p.native().cbegin()` is a *directory-separator*.

Then appends `p.native()` to `pathname`.

3       *Returns:* `*this`.

```

template <class Source>
    path& operator/=(const Source& source);
template <class Source>
    path& append(const Source& source);
template <class InputIterator>
    path& append(InputIterator first, InputIterator last);

```

4       *Effects:* Appends `path::preferred_separator` to `pathname`, converting format and encoding if required (27.10.8.2), unless:

- (4.1)       — an added *directory-separator* would be redundant, or
- (4.2)       — an added *directory-separator* would change an relative path to an absolute path, or
- (4.3)       — `source.empty()` is true, or
- (4.4)       — `*source.native().cbegin()` is a *directory-separator*.

Then appends the effective range of `source` (27.10.8.3) or the range `[first, last)` to `pathname`, converting format and encoding if required (27.10.8.2).

5       *Returns:* `*this`.

## 27.10.8.4.4 path concatenation

[path.concat]

```

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(const value_type* x);
path& operator+=(value_type x);
template <class Source>
    path& operator+=(const Source& x);
template <class EcharT>
    path& operator+=(EcharT x);
template <class Source>
    path& concat(const Source& x);
template <class InputIterator>
    path& concat(InputIterator first, InputIterator last);

```

1 *Postcondition:* `native() == prior_native + effective-argument`, where `prior_native` is `native()` prior to the call to `operator+=`, and *effective-argument* is:

- (1.1) — if `x` is present and is `const path&`, `x.native()`; otherwise,
- (1.2) — if `source` is present, the effective range of `source` (27.10.8.3); otherwise,
- (1.3) — if `first` and `last` are present, the range `[first, last)`; otherwise,
- (1.4) — `x`.

If the value type of *effective-argument* would not be `path::value_type`, the actual argument or argument range is first converted (27.10.8.2.2) so that *effective-argument* has value type `path::value_type`.

2 *Returns:* `*this`.

## 27.10.8.4.5 path modifiers

[path.modifiers]

```
void clear() noexcept;
```

1 *Postcondition:* `empty() == true`.

```
path& make_preferred();
```

2 *Effects:* Each *directory-separator* is converted to *preferred-separator*.

3 *Returns:* `*this`.

4 [ *Example:*

```

path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';

```

On an operating system where *preferred-separator* is the same as *directory-separator*, the output is:

```

"foo/bar"
"foo/bar"

```

On an operating system where *preferred-separator* is a backslash, the output is:

```

"foo/bar"
"foo\bar"

```

— *end example*]

```
path& remove_filename();
```

5     *Postcondition:* !has\_filename().

6     *Returns:* \*this.

7     [ *Example:*

```
std::cout << path("/foo").remove_filename(); // outputs "/"
std::cout << path("/").remove_filename();    // outputs ""
```

— *end example* ]

```
path& replace_filename(const path& replacement);
```

8     *Effects:* As if by:

```
remove_filename();
operator/=(replacement);
```

9     *Returns:* \*this.

10    [ *Example:*

```
std::cout << path("/").replace_filename("bar"); // outputs "bar"
```

— *end example* ]

```
path& replace_extension(const path& replacement = path());
```

11    *Effects:* `pathname` (the stored path) is modified as follows:

- (11.1) — Any existing `extension()` (27.10.8.4.9) is removed from the stored path, then
- (11.2) — If `replacement` is not empty and does not begin with a dot character, a dot character is appended to the stored path, then
- (11.3) — `replacement` is concatenated to the stored path.

12    *Returns:* \*this.

```
void swap(path& rhs) noexcept;
```

13    *Effects:* Swaps the contents of the two paths `pathname` and `rhs.pathname`.

14    *Complexity:* constant time.

#### 27.10.8.4.6 path native format observers

[path.native.obs]

1 The string returned by all native format observers is in the native pathname format (27.10.4.11).

```
const string_type& native() const noexcept;
```

2     *Returns:* `pathname`.

```
const value_type* c_str() const noexcept;
```

3     *Returns:* `pathname.c_str()`.

```
operator string_type() const;
```

4     *Returns:* `pathname`.

5     [ *Note:* Conversion to `string_type` is provided so that an object of class `path` can be given as an argument to existing standard library file stream constructors and open functions. — *end note* ]

```
template <class EcharT, class traits = char_traits<EcharT>,
        class Allocator = allocator<EcharT>>
    basic_string<EcharT, traits, Allocator>
    string(const Allocator& a = Allocator()) const;
```

6 *Returns:* pathname.

7 *Remarks:* All memory allocation, including for the return value, shall be performed by **a**. Conversion, if any, is specified by 27.10.8.2.

```
std::string string() const;
std::wstring wstring() const;
std::string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;
```

8 *Returns:* pathname.

9 *Remarks:* Conversion, if any, is performed as specified by 27.10.8.2. The encoding of the string returned by `u8string()` is always UTF-8.

#### 27.10.8.4.7 path generic format observers

[path.generic.obs]

1 Generic format observer functions return strings formatted according to the generic pathname format (27.10.8.1). The forward slash ('/') character is used as the *directory-separator* character.

2 [ *Example:* On an operating system that uses backslash as its *preferred-separator*, `path("foo\\bar").generic_string()` returns "foo/bar". — *end example* ]

```
template <class EcharT, class traits = char_traits<EcharT>,
        class Allocator = allocator<EcharT>>
    basic_string<EcharT, traits, Allocator>
    generic_string(const Allocator& a = Allocator()) const;
```

3 *Returns:* pathname, reformatted according to the generic pathname format (27.10.8.1).

4 *Remarks:* All memory allocation, including for the return value, shall be performed by **a**. Conversion, if any, is specified by 27.10.8.2.

```
std::string generic_string() const;
std::wstring generic_wstring() const;
std::string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;
```

5 *Returns:* pathname, reformatted according to the generic pathname format (27.10.8.1).

6 *Remarks:* Conversion, if any, is specified by 27.10.8.2. The encoding of the string returned by `generic_u8string()` is always UTF-8.

#### 27.10.8.4.8 path compare

[path.compare]

```
int compare(const path& p) const noexcept;
```

1 *Returns:*

- (1.1) — A value less than 0, if `native()` for the elements of `*this` are lexicographically less than `native()` for the elements of `p`; otherwise,
- (1.2) — a value greater than 0, if `native()` for the elements of `*this` are lexicographically greater than `native()` for the elements of `p`; otherwise,

(1.3) — 0.

2 *Remarks:* The elements are determined as if by iteration over the half-open range `[begin(), end())` for `*this` and `p`.

```
int compare(const string_type& s) const
```

3 *Returns:* `compare(path(s))`.

```
int compare(const value_type* s) const
```

4 *Returns:* `compare(path(s))`.

#### 27.10.8.4.9 path decomposition [`path.decompose`]

```
path root_name() const;
```

1 *Returns:* *root-name*, if *pathname* includes *root-name*, otherwise `path()`.

```
path root_directory() const;
```

2 *Returns:* *root-directory*, if *pathname* includes *root-directory*, otherwise `path()`. If *root-directory* is composed of *slash name*, *slash* is excluded from the returned string.

```
path root_path() const;
```

3 *Returns:* `root_name() / root_directory()`.

```
path relative_path() const;
```

4 *Returns:* A path composed from *pathname*, if `!empty()`, beginning with the first *filename* after *root-path*. Otherwise, `path()`.

```
path parent_path() const;
```

5 *Returns:* `(empty() || begin() == --end()) ? path() : pp`, where *pp* is constructed as if by starting with an empty path and successively applying `operator/=` for each element in the range `[begin(), --end())`.

```
path filename() const;
```

6 *Returns:* `empty() ? path() : *--end()`.

7 [ *Example:*

```
std::cout << path("/foo/bar.txt").filename(); // outputs "bar.txt"
std::cout << path("/").filename();           // outputs "/"
std::cout << path(".").filename();            // outputs "."
std::cout << path("..").filename();           // outputs ".."
```

— *end example* ]

```
path stem() const;
```

8 *Returns:* if `filename()` contains a period but does not consist solely of one or two periods, returns the substring of `filename()` starting at its beginning and ending with the character before the last period. Otherwise, returns `filename()`.

9 [ *Example:*

```
std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
    std::cout << p.extension() << '\n';
// outputs: .tar
// .baz
// .bar
```

— end example]

path extension() const;

10 *Returns:* if filename() contains a period but does not consist solely of one or two periods, returns the substring of filename() starting at the rightmost period and for the remainder of the path. Otherwise, returns an empty path object.

11 *Remarks:* Implementations are permitted to define additional behavior for file systems which append additional elements to extensions, such as alternate data streams or partitioned dataset names.

12 [Example:

```
std::cout << path("/foo/bar.txt").extension(); // outputs ".txt"
```

— end example]

13 [Note: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. Also note that for a path p, p.stem()+p.extension() == p.filename().

— end note]

#### 27.10.8.4.10 path query

[path.query]

bool empty() const noexcept;

1 *Returns:* pathname.empty().

bool has\_root\_path() const;

2 *Returns:* !root\_path().empty().

bool has\_root\_name() const;

3 *Returns:* !root\_name().empty().

bool has\_root\_directory() const;

4 *Returns:* !root\_directory().empty().

bool has\_relative\_path() const;

5 *Returns:* !relative\_path().empty().

bool has\_parent\_path() const;

6 *Returns:* !parent\_path().empty().

bool has\_filename() const;

7 *Returns:* !filename().empty().

bool has\_stem() const;

8 *Returns:* !stem().empty().

```
bool has_extension() const;
```

9       *Returns:* `!extension().empty()`.

```
bool is_absolute() const;
```

10       *Returns:* `true` if `pathname` contains an absolute path (27.10.4.1), else `false`.

11       [*Example:* `path("/").is_absolute()` is `true` for POSIX based operating systems, and `false` for Windows based operating systems. — *end example*]

```
bool is_relative() const;
```

12       *Returns:* `!is_absolute()`.

### 27.10.8.5 path iterators

[**path.itr**]

1 Path iterators iterate over the elements of `pathname` in the generic format (27.10.8.1).

2 A `path::iterator` is a constant iterator satisfying all the requirements of a bidirectional iterator (24.2.6). Its `value_type` is `path`.

3 Calling any non-const member function of a `path` object invalidates all iterators referring to elements of that object.

4 For the elements of `pathname` in the generic format, the forward traversal order is as follows:

(4.1) — The *root-name* element, if present.

(4.2) — The *root-directory* element, if present. [*Note:* the generic format is required to ensure lexicographical comparison works correctly. — *end note*]

(4.3) — Each successive *filename* element, if present.

(4.4) — *dot*, if one or more trailing non-root *slash* characters are present.

5 The backward traversal order is the reverse of forward traversal.

```
iterator begin() const;
```

6       *Returns:* An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

```
iterator end() const;
```

7       *Returns:* The end iterator.

### 27.10.8.6 path non-member functions

[**path.non-member**]

```
void swap(path& lhs, path& rhs) noexcept;
```

1       *Effects:* As if by `lhs.swap(rhs)`.

```
size_t hash_value (const path& p) noexcept;
```

2       *Returns:* A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_value(p2)`.

```
bool operator< (const path& lhs, const path& rhs) noexcept;
```

3       *Returns:* `lhs.compare(rhs) < 0`.

```
bool operator<=(const path& lhs, const path& rhs) noexcept;
```

4     *Returns:* `!(rhs < lhs)`.

```
bool operator> (const path& lhs, const path& rhs) noexcept;
```

5     *Returns:* `rhs < lhs`.

```
bool operator>=(const path& lhs, const path& rhs) noexcept;
```

6     *Returns:* `!(lhs < rhs)`.

```
bool operator==(const path& lhs, const path& rhs) noexcept;
```

7     *Returns:* `!(lhs < rhs) && !(rhs < lhs)`.

8     [*Note:* Path equality and path equivalence have different semantics.

9     Equality is determined by the `path` non-member `operator==`, which considers the two path's lexical representations only. Thus `path("foo") == "bar"` is never `true`.

10    Equivalence is determined by the `equivalent()` non-member function, which determines if two paths resolve to the same file system entity. Thus `equivalent("foo", "bar")` will be `true` when both paths resolve to the same file.

11    Programmers wishing to determine if two paths are “the same” must decide if “the same” means “the same representation” or “resolve to the same actual file”, and choose the appropriate function accordingly. — *end note*]

```
bool operator!=(const path& lhs, const path& rhs) noexcept;
```

12    *Returns:* `!(lhs == rhs)`.

```
path operator/ (const path& lhs, const path& rhs);
```

13    *Returns:* `path(lhs) /= rhs`.

#### 27.10.8.6.1 path inserter and extractor

[`path.io`]

```
template <class charT, class traits>
```

```
    basic_ostream<charT, traits>&
```

```
        operator<<(basic_ostream<charT, traits>& os, const path& p);
```

1     *Effects:* As if by: `os << quoted(p.string<charT, traits>());` [*Note:* The `quoted` function is described in 27.7.6. — *end note*]

2     *Returns:* `os`.

```
template <class charT, class traits>
```

```
    basic_istream<charT, traits>&
```

```
        operator>>(basic_istream<charT, traits>& is, path& p);
```

3     *Effects:* As if by:

```
        basic_string<charT, traits> tmp;
        is >> quoted(tmp);
        p = tmp;
```

4     *Returns:* `is`.

**27.10.8.6.2 path factory functions****[path.factory]**

```
template <class Source>
    path u8path(const Source& source);
template <class InputIterator>
    path u8path(InputIterator first, InputIterator last);
```

1 *Requires:* The source and [first, last) sequences are UTF-8 encoded. The value type of Source and InputIterator is char.

2 *Returns:*

(2.1) — If value\_type is char and the current native narrow encoding (27.10.4.10) is UTF-8, return path(source) or path(first, last); otherwise,

(2.2) — if value\_type is wchar\_t and the native wide encoding is UTF-16, or if value\_type is char16\_t or char32\_t, convert source or [first, last) to a temporary, tmp, of type string\_type and return path(tmp); otherwise,

(2.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).

3 *Remarks:* Argument format conversion (27.10.8.2.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

4 [*Example:* A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));
```

5 For POSIX based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

6 For POSIX based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

7 For Windows based operating systems a conversion from UTF-8 to UTF-16 occurs. — *end example*]

**27.10.9 Class filesystem\_error****[class.filesystem\_error]**

```
namespace std::filesystem {
    class filesystem_error : public system_error {
    public:
        filesystem_error(const string& what_arg, error_code ec);
        filesystem_error(const string& what_arg,
                        const path& p1, error_code ec);
        filesystem_error(const string& what_arg,
                        const path& p1, const path& p2, error_code ec);

        const path& path1() const noexcept;
        const path& path2() const noexcept;
        const char* what() const noexcept;
    };
}
```

1 The class filesystem\_error defines the type of objects thrown as exceptions to report file system errors from functions described in this sub-clause.

**27.10.9.1 filesystem\_error members****[filesystem\_error.members]**

1 Constructors are provided that store zero, one, or two paths associated with an error.

```
filesystem_error(const string& what_arg, error_code ec);
```

<sup>2</sup> *Postconditions:* The postconditions of this function are indicated in Table 142.

Table 142 — `filesystem_error(const string&, error_code)` effects

| Expression                         | Value                         |
|------------------------------------|-------------------------------|
| <code>runtime_error::what()</code> | <code>what_arg.c_str()</code> |
| <code>code()</code>                | <code>ec</code>               |
| <code>path1().empty()</code>       | <code>true</code>             |
| <code>path2().empty()</code>       | <code>true</code>             |

```
filesystem_error(const string& what_arg, const path& p1, error_code ec);
```

<sup>3</sup> *Postconditions:* The postconditions of this function are indicated in Table 143.

Table 143 — `filesystem_error(const string&, const path&, error_code)` effects

| Expression                         | Value                                       |
|------------------------------------|---------------------------------------------|
| <code>runtime_error::what()</code> | <code>what_arg.c_str()</code>               |
| <code>code()</code>                | <code>ec</code>                             |
| <code>path1()</code>               | Reference to stored copy of <code>p1</code> |
| <code>path2().empty()</code>       | <code>true</code>                           |

```
filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);
```

<sup>4</sup> *Postconditions:* The postconditions of this function are indicated in Table 144.

Table 144 — `filesystem_error(const string&, const path&, const path&, error_code)` effects

| Expression                         | Value                                       |
|------------------------------------|---------------------------------------------|
| <code>runtime_error::what()</code> | <code>what_arg.c_str()</code>               |
| <code>code()</code>                | <code>ec</code>                             |
| <code>path1()</code>               | Reference to stored copy of <code>p1</code> |
| <code>path2()</code>               | Reference to stored copy of <code>p2</code> |

```
const path& path1() const noexcept;
```

<sup>5</sup> *Returns:* A reference to the copy of `p1` stored by the constructor, or, if none, an empty path.

```
const path& path2() const noexcept;
```

<sup>6</sup> *Returns:* A reference to the copy of `p2` stored by the constructor, or, if none, an empty path.

```
const char* what() const noexcept;
```

<sup>7</sup> *Returns:* A string containing `runtime_error::what()`. The exact format is unspecified. Implementations are encouraged but not required to include `path1.native_string()` if not empty, `path2.native_string()` if not empty, and `system_error::what()` strings in the returned string.

## 27.10.10 Enumerations

[fs.enum]

### 27.10.10.1 Enum class `file_type`

[enum.file\_type]

<sup>1</sup> This enum class specifies constants used to identify file types, with the meanings listed in Table 145.

Table 145 — Enum class `file_type`

| Constant               | Value | Meaning                                                                                                                                                                |
|------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>none</code>      | 0     | The type of the file has not been determined or an error occurred while trying to determine the type.                                                                  |
| <code>not_found</code> | -1    | Pseudo-type indicating the file was not found. [ <i>Note: The file not being found is not considered an error while determining the type of a file. — end note</i> ]   |
| <code>regular</code>   | 1     | Regular file                                                                                                                                                           |
| <code>directory</code> | 2     | Directory file                                                                                                                                                         |
| <code>symlink</code>   | 3     | Symbolic link file                                                                                                                                                     |
| <code>block</code>     | 4     | Block special file                                                                                                                                                     |
| <code>character</code> | 5     | Character special file                                                                                                                                                 |
| <code>fifo</code>      | 6     | FIFO or pipe file                                                                                                                                                      |
| <code>socket</code>    | 7     | Socket file                                                                                                                                                            |
| <code>unknown</code>   | 8     | The file does exist, but is of an operating system dependent type not covered by any of the other cases or the process does not have permission to query the file type |

**27.10.10.2 Enum class `copy_options`****[enum.copy\_options]**

- <sup>1</sup> The enum class type `copy_options` is a bitmask type (17.5.2.1.3) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 146. Constant `none` is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Calling a library function with more than a single constant for an option group results in undefined behavior.

**27.10.10.3 Enum class `perms`****[enum.perms]**

- <sup>1</sup> The enum class type `perms` is a bitmask type (17.5.2.1.3) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 147.

**27.10.10.4 Enum class `directory_options`****[enum.directory\_options]**

- <sup>1</sup> The enum class type `directory_options` is a bitmask type (17.5.2.1.3) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 148.

**27.10.11 Class `file_status`****[class.file\_status]**

```

namespace std::filesystem {
    class file_status {
    public:
        // 27.10.11.1, constructors and destructor:
        explicit file_status(file_type ft = file_type::none,
                           perms prms = perms::unknown) noexcept;
        file_status(const file_status&) noexcept = default;
        file_status(file_status&&) noexcept = default;
        ~file_status();

        // assignments:
        file_status& operator=(const file_status&) noexcept = default;
        file_status& operator=(file_status&&) noexcept = default;

        // 27.10.11.3, modifiers:
        void          type(file_type ft) noexcept;

```

Table 146 — Enum class `copy_options`

| Option group controlling <code>copy_file</code> function effects for existing target files |       |                                                                                                                                                    |

| <code>create_symlinks</code>                                                               | 128   | Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory. |
| <code>create_hard_links</code>                                                             | 256   | Make hard links instead of copies of files.                                                                                                        |

```

void      permissions(perms prms) noexcept;

// 27.10.11.2, observers:
file_type type() const noexcept;
perms     permissions() const noexcept;
};
}

```

<sup>1</sup> An object of type `file_status` stores information about the type and permissions of a file.

#### 27.10.11.1 `file_status` constructors [`file_status.cons`]

```
explicit file_status() noexcept;
```

<sup>1</sup> *Postconditions:* `type() == file_type::none` and `permissions() == perms::unknown`.

```
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

<sup>2</sup> *Postconditions:* `type() == ft` and `permissions() == prms`.

#### 27.10.11.2 `file_status` observers [`file_status.obs`]

```
file_type type() const noexcept;
```

<sup>1</sup> *Returns:* The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.

Table 148 — Enum class `directory_options`

| Name                                  | Value | Meaning                                                            |
|---------------------------------------|-------|--------------------------------------------------------------------|
| <code>none</code>                     | 0     | (Default) Skip directory symlinks, permission denied is an error.  |
| <code>follow_directory_symlink</code> | 1     | Follow rather than skip directory symlinks.                        |
| <code>skip_permission_denied</code>   | 2     | Skip directories that would otherwise result in permission denied. |

```
perms permissions() const noexcept;
```

- <sup>2</sup> *Returns:* The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

### 27.10.11.3 file\_status modifiers [file\_status.mods]

```
void type(file_type ft) noexcept;
```

- <sup>1</sup> *Postconditions:* `type() == ft`.

```
void permissions(perms prms) noexcept;
```

- <sup>2</sup> *Postconditions:* `permissions() == prms`.

### 27.10.12 Class directory\_entry [class.directory\_entry]

```
namespace std::filesystem {
    class directory_entry {
    public:
        // 27.10.12.1, constructors and destructor:
        explicit directory_entry(const path& p);
        directory_entry() noexcept = default;
        directory_entry(const directory_entry&) = default;
        directory_entry(directory_entry&&) noexcept = default;
        ~directory_entry();

        // assignments:
        directory_entry& operator=(const directory_entry&) = default;
        directory_entry& operator=(directory_entry&&) noexcept = default;

        // 27.10.12.2, modifiers:
        void assign(const path& p);
        void replace_filename(const path& p);

        // 27.10.12.3, observers:
        const path& path() const noexcept;
        operator const path&() const noexcept;
        file_status status() const;
        file_status status(error_code& ec) const noexcept;
        file_status symlink_status() const;
        file_status symlink_status(error_code& ec) const noexcept;

        bool operator< (const directory_entry& rhs) const noexcept;
        bool operator==(const directory_entry& rhs) const noexcept;
        bool operator!=(const directory_entry& rhs) const noexcept;
        bool operator<=(const directory_entry& rhs) const noexcept;
        bool operator> (const directory_entry& rhs) const noexcept;
        bool operator>=(const directory_entry& rhs) const noexcept;

    private:
        path pathobject; // exposition only
    };
}
```

- <sup>1</sup> A `directory_entry` object stores a path object.

#### 27.10.12.1 directory\_entry constructors [directory\_entry.cons]

```
explicit directory_entry(const path& p);
```

1     *Effects:* Constructs an object of type `directory_entry`.

2     *Postcondition:* `path() == p`.

### 27.10.12.2 `directory_entry` modifiers

[`directory_entry.mods`]

```
void assign(const path& p);
```

1     *Postcondition:* `path() == p`.

```
void replace_filename(const path& p);
```

2     *Postcondition:* `path() == x.parent_path() / p` where `x` is the value of `path()` before the function is called.

### 27.10.12.3 `directory_entry` observers

[`directory_entry.obs`]

```
const path& path() const noexcept;
```

```
operator const path&() const noexcept;
```

1     *Returns:* `pathobject`.

```
file_status status() const;
```

```
file_status status(error_code& ec) const noexcept;
```

2     *Returns:* `status(path())` or `status(path(), ec)`, respectively.

3     *Throws:* As specified in Error reporting ([27.10.7](#)).

```
file_status symlink_status() const;
```

```
file_status symlink_status(error_code& ec) const noexcept;
```

4     *Returns:* `symlink_status(path())` or `symlink_status(path(), ec)`, respectively.

5     *Throws:* As specified in Error reporting ([27.10.7](#)).

```
bool operator==(const directory_entry& rhs) const noexcept;
```

6     *Returns:* `pathobject == rhs.pathobject`.

```
bool operator!=(const directory_entry& rhs) const noexcept;
```

7     *Returns:* `pathobject != rhs.pathobject`.

```
bool operator< (const directory_entry& rhs) const noexcept;
```

8     *Returns:* `pathobject < rhs.pathobject`.

```
bool operator<=(const directory_entry& rhs) const noexcept;
```

9     *Returns:* `pathobject <= rhs.pathobject`.

```
bool operator> (const directory_entry& rhs) const noexcept;
```

10    *Returns:* `pathobject > rhs.pathobject`.

```
bool operator>=(const directory_entry& rhs) const noexcept;
```

11    *Returns:* `pathobject >= rhs.pathobject`.

**27.10.13 Class `directory_iterator`****[`class.directory_iterator`]**

- <sup>1</sup> An object of type `directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory. [ *Note:* For iteration into sub-directories, see class `recursive_directory_iterator` (27.10.14). — *end note* ]

```
namespace std::filesystem {
    class directory_iterator {
    public:
        typedef directory_entry      value_type;
        typedef ptrdiff_t            difference_type;
        typedef const directory_entry* pointer;
        typedef const directory_entry& reference;
        typedef input_iterator_tag    iterator_category;

        // 27.10.13.1, member functions:
        directory_iterator() noexcept;
        explicit directory_iterator(const path& p);
        directory_iterator(const path& p, directory_options options);
        directory_iterator(const path& p, error_code& ec) noexcept;
        directory_iterator(const path& p, directory_options options,
                           error_code& ec) noexcept;
        directory_iterator(const directory_iterator& rhs);
        directory_iterator(directory_iterator&& rhs) noexcept;
        ~directory_iterator();

        directory_iterator& operator=(const directory_iterator& rhs);
        directory_iterator& operator=(directory_iterator&& rhs) noexcept;

        const directory_entry& operator*() const;
        const directory_entry* operator->() const;
        directory_iterator& operator++();
        directory_iterator& increment(error_code& ec) noexcept;

        // other members as required by 24.2.3, input iterators
    };
}
```

- <sup>2</sup> `directory_iterator` satisfies the requirements of an input iterator (24.2.3).
- <sup>3</sup> If an iterator of type `directory_iterator` is advanced past the last directory element, that iterator shall become equal to the end iterator value. The `directory_iterator` default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.
- <sup>4</sup> The result of `operator*` on an end iterator is undefined behavior. For any other iterator value a `const directory_entry&` is returned. The result of `operator->` on an end iterator is undefined behavior. For any other iterator value a `const directory_entry*` is returned.
- <sup>5</sup> Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.
- <sup>6</sup> The result of calling the `path()` member of the `directory_entry` object obtained by dereferencing a `directory_iterator` is a reference to a `path` object composed of the directory argument from which the iterator was constructed with filename of the directory entry appended as if by `operator/=`.
- <sup>7</sup> Directory iteration shall not yield directory entries for the current (*dot*) and parent (*dot-dot*) directories.
- <sup>8</sup> The order of directory entries obtained by dereferencing successive increments of a `directory_iterator` is unspecified.

- <sup>9</sup> [*Note:* Programs performing directory iteration may wish to test if the path obtained by dereferencing a directory iterator actually exists. It could be a symbolic link to a non-existent file. Programs recursively walking directory trees for purposes of removing and renaming entries may wish to avoid following symbolic links.
- <sup>10</sup> If a file is removed from or added to a directory after the construction of a `directory_iterator` for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX `readdir_r`. — *end note*]

### 27.10.13.1 `directory_iterator` members

[`directory_iterator.members`]

```
directory_iterator() noexcept;
```

- <sup>1</sup> *Effects:* Constructs the end iterator.

```
explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec) noexcept;
directory_iterator(const path& p, directory_options options, error_code& ec) noexcept;
```

- <sup>2</sup> *Effects:* For the directory that `p` resolves to, constructs an iterator for the first element in a sequence of `directory_entry` elements representing the files in the directory, if any; otherwise the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

- <sup>3</sup> *Throws:* As specified in Error reporting (27.10.7).

- <sup>4</sup> [*Note:* To iterate over the current directory, use `directory_iterator(".")` rather than `directory_iterator("")`. — *end note*]

```
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
```

- <sup>5</sup> *Effects:* Constructs an object of class `directory_iterator`.

- <sup>6</sup> *Postconditions:* `*this` has the original value of `rhs`.

```
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
```

- <sup>7</sup> *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

- <sup>8</sup> *Postconditions:* `*this` has the original value of `rhs`.

- <sup>9</sup> *Returns:* `*this`.

```
directory_iterator& operator++();
directory_iterator& increment(error_code& ec) noexcept;
```

- <sup>10</sup> *Effects:* As specified by Input iterators (24.2.3).

- <sup>11</sup> *Returns:* `*this`.

- <sup>12</sup> *Throws:* As specified in Error reporting (27.10.7).

**27.10.13.2 directory\_iterator non-member functions** [directory\_iterator.nonmembers]

<sup>1</sup> These functions enable range access for `directory_iterator`.

```
directory_iterator begin(directory_iterator iter) noexcept;
```

<sup>2</sup> *Returns:* iter.

```
directory_iterator end(const directory_iterator&) noexcept;
```

<sup>3</sup> *Returns:* `directory_iterator()`.

**27.10.14 Class recursive\_directory\_iterator** [class.rec.dir.itr]

<sup>1</sup> An object of type `recursive_directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory and its sub-directories.

```
namespace std::filesystem {
    class recursive_directory_iterator {
    public:
        typedef directory_entry      value_type;
        typedef ptrdiff_t            difference_type;
        typedef const directory_entry* pointer;
        typedef const directory_entry& reference;
        typedef input_iterator_tag   iterator_category;

        // 27.10.14.1, constructors and destructor:
        recursive_directory_iterator() noexcept;
        explicit recursive_directory_iterator(const path& p);
        recursive_directory_iterator(const path& p, directory_options options);
        recursive_directory_iterator(const path& p, directory_options options,
                                     error_code& ec) noexcept;
        recursive_directory_iterator(const path& p, error_code& ec) noexcept;
        recursive_directory_iterator(const recursive_directory_iterator& rhs);
        recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
        ~recursive_directory_iterator();

        // 27.10.14.1, observers:
        directory_options options() const;
        int depth() const;
        bool recursion_pending() const;

        const directory_entry& operator*() const;
        const directory_entry* operator->() const;

        // 27.10.14.1, modifiers:
        recursive_directory_iterator&
            operator=(const recursive_directory_iterator& rhs);
        recursive_directory_iterator&
            operator=(recursive_directory_iterator&& rhs) noexcept;

        recursive_directory_iterator& operator++();
        recursive_directory_iterator& increment(error_code& ec) noexcept;

        void pop();
        void disable_recursion_pending();

        // other members as required by 24.2.3, input iterators
```

```
};
}
```

<sup>2</sup> The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.

<sup>3</sup> [*Note:* If the directory structure being iterated over contains cycles then the end iterator may be unreachable. — *end note*]

#### 27.10.14.1 `recursive_directory_iterator` members [rec.dir.itr.members]

```
recursive_directory_iterator() noexcept;
```

<sup>1</sup> *Effects:* Constructs the end iterator.

```
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec) noexcept;
recursive_directory_iterator(const path& p, error_code& ec) noexcept;
```

<sup>2</sup> *Effects:* Constructs a iterator representing the first entry in the directory `p` resolves to, if any; otherwise, the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

<sup>3</sup> *Postcondition:* `options() == options` for the signatures with a `directory_options` argument, otherwise `options() == directory_options::none`.

<sup>4</sup> *Throws:* As specified in Error reporting (27.10.7).

<sup>5</sup> [*Note:* To iterate over the current directory, use `recursive_directory_iterator(".")` rather than `recursive_directory_iterator("")`. — *end note*]

<sup>6</sup> [*Note:* By default, `recursive_directory_iterator` does not follow directory symlinks. To follow directory symlinks, specify `options` as `directory_options::follow_directory_symlink` — *end note*]

```
recursive_directory_iterator(const recursive_directory_iterator& rhs);
```

<sup>7</sup> *Effects:* Constructs an object of class `recursive_directory_iterator`.

<sup>8</sup> *Postconditions:*

(8.1) — `this->options() == rhs.options()`

(8.2) — `this->depth() == rhs.depth()`

(8.3) — `this->recursion_pending() == rhs.recursion_pending()`

```
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
```

<sup>9</sup> *Effects:* Constructs an object of class `recursive_directory_iterator`.

<sup>10</sup> *Postconditions:* `this->options()`, `this->depth()`, and `this->recursion_pending()` return the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

```
recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);
```

<sup>11</sup> *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

<sup>12</sup> *Postconditions:*

```

(12.1)      — this->options() == rhs.options()
(12.2)      — this->depth() == rhs.depth()
(12.3)      — this->recursion_pending() == rhs.recursion_pending()

13      Returns: *this.

recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;

14      Effects: If *this and rhs are the same object, the member has no effect.
15      Postconditions: this->options(), this->depth(), and this->recursion_pending() return the
        values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before
        the function call.
16      Returns: *this.

directory_options options() const;

17      Requires: *this != recursive_directory_iterator().
18      Returns: The value of the constructor options argument, if present, otherwise directory_options::none.
19      Throws: Nothing.

int depth() const;

20      Requires: *this != recursive_directory_iterator().
21      Returns: The current depth of the directory tree being traversed. [ Note: The initial directory is depth
        0, its immediate subdirectories are depth 1, and so forth. — end note ]
22      Throws: Nothing.

bool recursion_pending() const;

23      Requires: *this != recursive_directory_iterator().
24      Returns: true if disable_recursion_pending() has not been called subsequent to the prior construc-
        tion or increment operation, otherwise false.
25      Throws: Nothing.

recursive_directory_iterator& operator++;
recursive_directory_iterator& increment(error_code& ec) noexcept;

26      Requires: *this != recursive_directory_iterator().
27      Effects: As specified by Input iterators (24.2.3), except that:
(27.1)      — If there are no more entries at the current depth, then if depth() != 0 iteration over the parent
        directory resumes; otherwise *this = recursive_directory_iterator().
(27.2)      — Otherwise if
            recursion_pending() && is_directory(this->status()) &&
            (!is_symlink(this->symlink_status()) ||
            (options() & directory_options::follow_directory_symlink) != directory_options::none)
        then either directory (*this)>path() is recursively iterated into or, if
            (options() & directory_options::skip_permission_denied) != directory_options::none
        and an error occurs indicating that permission to access directory (*this)>path() is denied,
        then directory (*this)>path() is treated as an empty directory and no error is reported.

```

28 *Returns:* `*this`.

29 *Throws:* As specified in Error reporting (27.10.7).

`void pop();`

30 *Requires:* `*this != recursive_directory_iterator()`.

31 *Effects:* If `depth() == 0`, set `*this` to `recursive_directory_iterator()`. Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

`void disable_recursion_pending();`

32 *Requires:* `*this != recursive_directory_iterator()`.

33 *Postcondition:* `recursion_pending() == false`.

34 [*Note:* `disable_recursion_pending()` is used to prevent unwanted recursion into a directory. — *end note*]

#### 27.10.14.2 `recursive_directory_iterator` non-member functions [rec.dir.itr.nonmembers]

1 These functions enable use of `recursive_directory_iterator` with range-based for statements.

`recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;`

2 *Returns:* `iter`.

`recursive_directory_iterator end(const recursive_directory_iterator&) noexcept;`

3 *Returns:* `recursive_directory_iterator()`.

#### 27.10.15 Filesystem operation functions [fs.op.funcs]

1 Filesystem operation functions query or modify files, including directories, in external storage.

2 [*Note:* Because hardware failures, network failures, file system races (27.10.4.6), and many other kinds of errors occur frequently in file system operations, users should be aware that any filesystem operation function, no matter how apparently innocuous, may encounter an error. See Error reporting (27.10.7). — *end note*]

##### 27.10.15.1 Absolute [fs.op.absolute]

`path absolute(const path& p, const path& base=current_path());`

1 *Returns:* An absolute path (27.10.4.1) composed according to Table 149.

Table 149 — `absolute_error(const path&, const path&)` return value

|                                 | <code>p.has_root_directory()</code>         | <code>!p.has_root_directory()</code>                                                                                                                              |
|---------------------------------|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>p.has_root_name()</code>  | <code>p</code>                              | <code>p.root_name()</code><br><code>/ absolute(base).root_directory()</code><br><code>/ absolute(base).relative_path()</code><br><code>/ p.relative_path()</code> |
| <code>!p.has_root_name()</code> | <code>absolute(base).root_name() / p</code> | <code>absolute(base) / p</code>                                                                                                                                   |

2 [*Note:* For the returned path, `rp`, `rp.is_absolute()` is `true`. — *end note*]

3 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.2 Canonical****[fs.op.canonical]**

```

path canonical(const path& p, const path& base = current_path());
path canonical(const path& p, error_code& ec);
path canonical(const path& p, const path& base, error_code& ec);

```

- 1 *Effects:* Converts `p`, which must exist, to an absolute path that has no symbolic link, `"."`, or `".."` elements.
- 2 *Returns:* A path that refers to the same file system object as `absolute(p, base)`. For the overload without a `base` argument, `base` is `current_path()`. Signatures with argument `ec` return `path()` if an error occurs.
- 3 *Throws:* As specified in Error reporting (27.10.7).
- 4 *Remarks:* `!exists(p)` is an error.

**27.10.15.3 Copy****[fs.op.copy]**

```

void copy(const path& from, const path& to);
void copy(const path& from, const path& to, error_code& ec) noexcept;

```

- 1 *Effects:* `copy(from, to, copy_options::none)` or `copy(from, to, copy_options::none, ec)`, respectively.

```

void copy(const path& from, const path& to, copy_options options);
void copy(const path& from, const path& to, copy_options options,
          error_code& ec) noexcept;

```

- 2 *Requires:* At most one constant from each option group (27.10.10.2) is present in `options`.
- 3 *Effects:* Before the first use of `f` and `t`:

- (3.1) — If
 

```

          (options & copy_options::create_symlinks) != copy_options::none ||
          (options & copy_options::skip_symlinks) != copy_options::none
      
```

 then `auto f = symlink_status(from)` and if needed `auto t = symlink_status(to)`.
- (3.2) — Otherwise, `auto f = status(from)` and if needed `auto t = status(to)`.

Effects are then as follows:

- (3.3) — An error is reported as specified in Error reporting (27.10.7) if:
  - (3.3.1) — `!exists(f)`, or
  - (3.3.2) — `equivalent(from, to)`, or
  - (3.3.3) — `is_other(f) || is_other(t)`, or
  - (3.3.4) — `is_directory(f) && is_regular_file(t)`.
- (3.4) — Otherwise, if `is_symlink(f)`, then:
  - (3.4.1) — If `(options & copy_options::skip_symlinks) != copy_options::none` then return.
  - (3.4.2) — Otherwise if
 

```

              !exists(t) && (options & copy_options::copy_symlinks) != copy_options::none
          
```

 then `copy_symlink(from, to, options)`.
  - (3.4.3) — Otherwise report an error as specified in Error reporting (27.10.7).
- (3.5) — Otherwise, if `is_regular_file(f)`, then:
  - (3.5.1) — If `(options & copy_options::directories_only) != copy_options::none`, then return.

- (3.5.2) — Otherwise if `(options & copy_options::create_symlinks) != copy_options::none`, then create a symbolic link to the source file.
- (3.5.3) — Otherwise if `(options & copy_options::create_hard_links) != copy_options::none`, then create a hard link to the source file.
- (3.5.4) — Otherwise if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.
- (3.5.5) — Otherwise, `copy_file(from, to, options)`.
- (3.6) — Otherwise, if
 

```
is_directory(f) &&
((options & copy_options::recursive) != copy_options::none ||
 options == copy_options::none)

then:
  (3.6.1) — If !exists(t), then create_directory(to, from).
```
- (3.6.2) — Then, iterate over the files in `from`, as if by `for (directory_entry& x : directory_iterator(from))`, and for each iteration
 

```
copy(x.path(), to/x.path().filename(), options | copy_options::unspecified)
```
- (3.7) — Otherwise, no effects.

4 *Throws:* As specified in Error reporting (27.10.7).

5 *Remarks:* For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.

6 [*Example:* Given this directory structure:

```
/dir1
  file1
  file2
  dir2
    file3
```

7 Calling `copy("/dir1", "/dir3")` would result in:

```
/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
```

8 Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive)` would result in:

```
/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
  dir2
    file3
```

— *end example*]

**27.10.15.4 Copy file****[fs.op.copy\_file]**

```
bool copy_file(const path& from, const path& to);
bool copy_file(const path& from, const path& to, error_code& ec) noexcept;
```

1 *Returns:* `copy_file(from, to, copy_options::none)` or  
`copy_file(from, to, copy_options::none, ec)`, respectively.

2 *Throws:* As specified in Error reporting (27.10.7).

```
bool copy_file(const path& from, const path& to, copy_options options);
bool copy_file(const path& from, const path& to, copy_options options,
               error_code& ec) noexcept;
```

3 *Requires:* At most one constant from each `copy_options` option group (27.10.10.2) is present in `options`.

4 *Effects:* As follows:

- (4.1) — Report a file already exists error as specified in Error reporting (27.10.7) if:
  - (4.1.1) — `exists(to)` and `equivalent(from, to)`, or
  - (4.1.2) — `exists(to)` and `(options & (copy_options::skip_existing | copy_options::overwrite_existing | copy_options::update_existing)) == copy_options::none`.
- (4.2) — Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if:
  - (4.2.1) — `!exists(to)`, or
  - (4.2.2) — `exists(to)` and `(options & copy_options::overwrite_existing) != copy_options::none`, or
  - (4.2.3) — `exists(to)` and `(options & copy_options::update_existing) != copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function (27.10.15.25).
- (4.3) — Otherwise, no effects.

5 *Returns:* `true` if the `from` file was copied, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

6 *Throws:* As specified in Error reporting (27.10.7).

7 *Complexity:* At most one direct or indirect invocation of `status(to)`.

**27.10.15.5 Copy symlink****[fs.op.copy\_symlink]**

```
void copy_symlink(const path& existing_symlink, const path& new_symlink);
void copy_symlink(const path& existing_symlink, const path& new_symlink,
                 error_code& ec) noexcept;
```

1 *Effects:* As if by `function(read_symlink(existing_symlink), new_symlink)` or  
`function(read_symlink(existing_symlink, ec), new_symlink, ec)`, respectively, where *function*  
is `create_symlink` or `create_directory_symlink`, as appropriate.

2 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.6 Create directories****[fs.op.create\_directories]**

```
bool create_directories(const path& p);
bool create_directories(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* Establishes the postcondition by calling `create_directory()` for any element of `p` that does not exist.
- 2 *Postcondition:* `is_directory(p)`.
- 3 *Returns:* `true` if a new directory was created, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.
- 4 *Throws:* As specified in Error reporting (27.10.7).
- 5 *Complexity:*  $\mathcal{O}(n)$  where  $n$  is the number of elements of `p` that do not exist.

#### 27.10.15.7 Create directory

[fs.op.create\_directory]

```
bool create_directory(const path& p);
bool create_directory(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* Establishes the postcondition by attempting to create the directory `p` resolves to, as if by POSIX `mkdir()` with a second argument of `static_cast<int>(perms::all)`. Creation failure because `p` resolves to an existing directory shall not be treated as an error.
- 2 *Postcondition:* `is_directory(p)`.
- 3 *Returns:* `true` if a new directory was created, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.
- 4 *Throws:* As specified in Error reporting (27.10.7).

```
bool create_directory(const path& p, const path& existing_p);
bool create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

- 5 *Effects:* Establishes the postcondition by attempting to create the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. Creation failure because `p` resolves to an existing directory shall not be treated as an error. [Note: For POSIX based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)`. For Windows based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`. — end note]
- 6 *Postcondition:* `is_directory(p)`.
- 7 *Returns:* `true` if a new directory was created, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.
- 8 *Throws:* As specified in Error reporting (27.10.7).

#### 27.10.15.8 Create directory symlink

[fs.op.create\_dir\_symlink]

```
void create_directory_symlink(const path& to, const path& new_symlink);
void create_directory_symlink(const path& to, const path& new_symlink,
                             error_code& ec) noexcept;
```

- 1 *Effects:* Establishes the postcondition, as if by POSIX `symlink()`.
- 2 *Postcondition:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.
- 3 *Throws:* As specified in Error reporting (27.10.7).
- 4 [Note: Some operating systems require symlink creation to identify that the link is to a directory. Portable code should use `create_directory_symlink()` to create directory symlinks rather than `create_symlink()` — end note]

- 5 [ *Note:* Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note* ]

### 27.10.15.9 Create hard link

[fs.op.create\_hard\_link]

```
void create_hard_link(const path& to, const path& new_hard_link);
void create_hard_link(const path& to, const path& new_hard_link,
                      error_code& ec) noexcept;
```

1 *Effects:* Establishes the postcondition, as if by POSIX `link()`.

2 *Postcondition:*

(2.1) — `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`

(2.2) — The contents of the file or directory `to` resolves to are unchanged.

3 *Throws:* As specified in Error reporting (27.10.7).

- 4 [ *Note:* Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — *end note* ]

### 27.10.15.10 Create symlink

[fs.op.create\_symlink]

```
void create_symlink(const path& to, const path& new_symlink);
void create_symlink(const path& to, const path& new_symlink,
                    error_code& ec) noexcept;
```

1 *Effects:* Establishes the postcondition, as if by POSIX `symlink()`.

2 *Postcondition:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

3 *Throws:* As specified in Error reporting (27.10.7).

- 4 [ *Note:* Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note* ]

### 27.10.15.11 Current path

[fs.op.current\_path]

```
path current_path();
path current_path(error_code& ec);
```

1 *Returns:* The absolute path of the current working directory, obtained as if by POSIX `getcwd()`. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws:* As specified in Error reporting (27.10.7).

3 *Remarks:* The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

4 [ *Note:* The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name.

5 The current path as returned by many operating systems is a dangerous global variable. It may be changed unexpectedly by a third-party or system library functions, or by another thread. — *end note* ]

```
void current_path(const path& p);
void current_path(const path& p, error_code& ec) noexcept;
```

- 6 *Effects:* Establishes the postcondition, as if by POSIX `chdir()`.  
 7 *Postcondition:* `equivalent(p, current_path())`.  
 8 *Throws:* As specified in Error reporting (27.10.7).  
 9 [ *Note:* The current path for many operating systems is a dangerous global state. It may be changed unexpectedly by a third-party or system library functions, or by another thread. — *end note* ]

#### 27.10.15.12 Exists [fs.op.exists]

- ```
bool exists(file_status s) noexcept;
```
- 1 *Returns:* `status_known(s) && s.type() != file_type::not_found`.
- ```
bool exists(const path& p);
bool exists(const path& p, error_code& ec) noexcept;
```
- 2 *Returns:* `exists(status(p))` or `exists(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.  
 3 *Throws:* As specified in Error reporting (27.10.7).

#### 27.10.15.13 Equivalent [fs.op.equivalent]

- ```
bool equivalent(const path& p1, const path& p2);
bool equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```
- 1 Let `s1` and `s2` be `file_status`s, determined as if by `status(p1)` and `status(p2)`, respectively.  
 2 *Effects:* Determines `s1` and `s2`.  
 3 *Returns:* `true`, if `s1 == s2` and `p1` and `p2` resolve to the same file system entity, else `false`. The signature with argument `ec` returns `false` if an error occurs.  
 4 Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location. This is determined as if by the values of the POSIX `stat` structure, obtained as if by `stat()` for the two paths, having equal `st_dev` values and equal `st_ino` values.  
 5 *Throws:* `filesystem_error` if `(!exists(s1) && !exists(s2)) || (is_other(s1) && is_other(s2))`, otherwise as specified in Error reporting (27.10.7).

#### 27.10.15.14 File size [fs.op.file\_size]

- ```
uintmax_t file_size(const path& p);
uintmax_t file_size(const path& p, error_code& ec) noexcept;
```
- 1 *Returns:* If `!exists(p) || !is_regular_file(p)` an error is reported (27.10.7). Otherwise, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` structure member `st_size` obtained as if by POSIX `stat()`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.  
 2 *Throws:* As specified in Error reporting (27.10.7).

#### 27.10.15.15 Hard link count [fs.op.hard\_lk\_ct]

- ```
uintmax_t hard_link_count(const path& p);
uintmax_t hard_link_count(const path& p, error_code& ec) noexcept;
```
- 1 *Returns:* The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.  
 2 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.16 Is block file****[fs.op.is\_block\_file]**

```
bool is_block_file(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::block`.

```
bool is_block_file(const path& p);
```

```
bool is_block_file(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.17 Is character file****[fs.op.is\_char\_file]**

```
bool is_character_file(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::character`.

```
bool is_character_file(const path& p);
```

```
bool is_character_file(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.18 Is directory****[fs.op.is\_directory]**

```
bool is_directory(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::directory`.

```
bool is_directory(const path& p);
```

```
bool is_directory(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.19 Is empty****[fs.op.is\_empty]**

```
bool is_empty(const path& p);
```

```
bool is_empty(const path& p, error_code& ec) noexcept;
```

1     Let `s` be the `file_status`, determined as if by `status(p, ec)`.

2     *Effects:* Determines `s`.

3     *Returns:*

```
is_directory(s) ? directory_iterator(p) == directory_iterator() : file_size(p) == 0;
```

The signature with argument `ec` returns `false` if an error occurs.

4     *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.20 Is fifo****[fs.op.is\_fifo]**

```
bool is_fifo(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::fifo`.

```
bool is_fifo(const path& p);
```

```
bool is_fifo(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.21 Is other****[fs.op.is\_other]**

```
bool is_other(file_status s) noexcept;
```

1 *Returns:* `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s)`.

```
bool is_other(const path& p);
```

```
bool is_other(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.22 Is regular file****[fs.op.is\_regular\_file]**

```
bool is_regular_file(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::regular`.

```
bool is_regular_file(const path& p);
```

2 *Returns:* `is_regular_file(status(p))`.

3 *Throws:* `filesystem_error` if `status(p)` would throw `filesystem_error`.

```
bool is_regular_file(const path& p, error_code& ec) noexcept;
```

4 *Effects:* Sets `ec` as if by `status(p, ec)`. [Note: `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — end note]

5 *Returns:* `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

**27.10.15.23 Is socket****[fs.op.is\_socket]**

```
bool is_socket(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::socket`.

```
bool is_socket(const path& p);
```

```
bool is_socket(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.24 Is symlink****[fs.op.is\_symlink]**

```
bool is_symlink(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::symlink`.

```
bool is_symlink(const path& p);
```

```
bool is_symlink(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_symlink(symlink_status(p))` or `is_symlink(symlink_status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.25 Last write time****[fs.op.last\_write\_time]**

```
file_time_type last_write_time(const path& p);
```

```
file_time_type last_write_time(const path& p, error_code& ec) noexcept;
```

1 *Returns:* The time of last data modification of `p`, determined as if by the value of the POSIX `stat` structure member `st_mtime` obtained as if by POSIX `stat()`. The signature with argument `ec` returns `file_time_type::min()` if an error occurs.

2 *Throws:* As specified in Error reporting (27.10.7).

```
void last_write_time(const path& p, file_time_type new_time);
```

```
void last_write_time(const path& p, file_time_type new_time,  
                    error_code& ec) noexcept;
```

3 *Effects:* Sets the time of last data modification of the file resolved to by `p` to `new_time`, as if by POSIX `futimens()`.

4 *Throws:* As specified in Error reporting (27.10.7).

5 [ *Note:* A postcondition of `last_write_time(p) == new_time` is not specified since it might not hold for file systems with coarse time granularity. — *end note* ]

**27.10.15.26 Permissions****[fs.op.permissions]**

```
void permissions(const path& p, perms prms);
```

```
void permissions(const path& p, perms prms, error_code& ec) noexcept;
```

1 *Requires:* `!((prms & perms::add_perms) != perms::none && (prms & perms::remove_perms) != perms::none)`.

2 *Effects:* Applies the effective permissions bits from `prms` to the file `p` resolves to, as if by POSIX `fchmodat()`. The effective permission bits are determined as specified in Table 150.

Table 150 — Effects of permission bits

| Bits present in <code>prms</code>                            | Effective bits applied                                              |
|--------------------------------------------------------------|---------------------------------------------------------------------|
| Neither <code>add_perms</code> nor <code>remove_perms</code> | <code>prms &amp; perms::mask</code>                                 |
| <code>add_perms</code>                                       | <code>status(p).permissions()   (prms &amp; perms::mask)</code>     |
| <code>remove_perms</code>                                    | <code>status(p).permissions() &amp; (prms &amp; perms::mask)</code> |

[ *Note:* Conceptually permissions are viewed as bits, but the actual implementation may use some other mechanism. — *end note* ]

3 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.27 Read symlink****[fs.op.read\_symlink]**

```
path read_symlink(const path& p);
path read_symlink(const path& p, error_code& ec);
```

- 1 *Returns:* If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.
- 2 *Throws:* As specified in Error reporting (27.10.7). [*Note:* It is an error if `p` does not resolve to a symbolic link. — *end note*]

**27.10.15.28 Remove****[fs.op.remove]**

```
bool remove(const path& p);
bool remove(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove()`. [*Note:* A symbolic link is itself removed, rather than the file it resolves to. — *end note*]
- 2 *Postcondition:* `!exists(symlink_status(p))`.
- 3 *Returns:* `false` if `p` did not exist, otherwise `true`. The signature with argument `ec` returns `false` if an error occurs.
- 4 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.29 Remove all****[fs.op.remove\_all]**

```
uintmax_t remove_all(const path& p);
uintmax_t remove_all(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove()`. [*Note:* A symbolic link is itself removed, rather than the file it resolves to. — *end note*]
- 2 *Postcondition:* `!exists(p)`.
- 3 *Returns:* The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.
- 4 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.30 Rename****[fs.op.rename]**

```
void rename(const path& old_p, const path& new_p);
void rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

- 1 *Effects:* Renames `old_p` to `new_p`, as if by POSIX `rename()`. [*Note:*
  - (1.1) — If `old_p` and `new_p` resolve to the same existing file, no action is taken.
  - (1.2) — Otherwise, the rename may include the following effects:
    - (1.2.1) — if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,
    - (1.2.2) — if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but may be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to. — *end note*

- 2 *Throws:* As specified in Error reporting (27.10.7).

**27.10.15.31 Resize file****[fs.op.resize\_file]**

```
void resize_file(const path& p, uintmax_t new_size);
void resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

- 1 *Postcondition:* `file_size() == new_size`.
- 2 *Throws:* As specified in Error reporting (27.10.7).
- 3 *Remarks:* Achieves its postconditions as if by POSIX `truncate()`.

**27.10.15.32 Space****[fs.op.space]**

```
space_info space(const path& p);
space_info space(const path& p, error_code& ec) noexcept;
```

- 1 *Returns:* An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frsize` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.
- 2 *Throws:* As specified in Error reporting (27.10.7).
- 3 *Remarks:* The value of member `space_info::available` is operating system dependent. [ *Note:* `available` may be less than `free`. — *end note* ]

**27.10.15.33 Status****[fs.op.status]**

```
file_status status(const path& p);
```

- 1 *Effects:* As if:
 

```
error_code ec;
file_status result = status(p, ec);
if (result == file_type::none)
    throw filesystem_error(implementation-supplied-message, p, ec);
return result;
```
- 2 *Returns:* See above.
- 3 *Throws:* `filesystem_error`. [ *Note:* result values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown. — *end note* ]

```
file_status status(const path& p, error_code& ec) noexcept;
```

- 4 *Effects:* If possible, determines the attributes of the file `p` resolves to, as if by POSIX `stat()`. If, during attribute determination, the underlying file system API reports an error, sets `ec` to indicate the specific error reported. Otherwise, `ec.clear()`. [ *Note:* This allows users to inspect the specifics of underlying API errors even when the value returned by `status()` is not `file_status(file_type::none)`. — *end note* ]
- 5 *Returns:*
  - (5.1) — If `ec != error_code()`:
    - (5.1.1) — If the specific error indicates that `p` cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.
    - (5.1.2) — Otherwise, if the specific error indicates that `p` can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.

- (5.1.3) — Otherwise, returns `file_status(file_type::none)`.  
 [ *Note:* These semantics distinguish between `p` being known not to exist, `p` existing but not being able to determine its attributes, and there being an error that prevents even knowing if `p` exists. These distinctions are important to some use cases. — *end note* ]
- (5.2) — Otherwise,
- (5.2.1) — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular)`. [ *Note:* `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory. — *end note* ]
- (5.2.2) — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory)`. [ *Note:* `file_type::directory` implies `directory_iterator(p)` would succeed. — *end note* ]
- (5.2.3) — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block)`.
- (5.2.4) — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character)`.
- (5.2.5) — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo)`.
- (5.2.6) — Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket)`.
- (5.2.7) — Otherwise, returns `file_status(file_type::unknown)`.

<sup>6</sup> *Remarks:* If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

#### 27.10.15.34 Status known

[`fs.op.status_known`]

```
bool status_known(file_status s) noexcept;
```

<sup>1</sup> *Returns:* `s.type() != file_type::none`.

#### 27.10.15.35 Symlink status

[`fs.op.symlink_status`]

```
file_status symlink_status(const path& p);
file_status symlink_status(const path& p, error_code& ec) noexcept;
```

<sup>1</sup> *Effects:* Same as `status()`, above, except that the attributes of `p` are determined as if by POSIX `lstat()`.

<sup>2</sup> *Returns:* Same as `status()`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink)`. The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.

<sup>3</sup> *Remarks:* Pathname resolution terminates if `p` names a symbolic link.

<sup>4</sup> *Throws:* As specified in Error reporting (27.10.7).

#### 27.10.15.36 System complete

[`fs.op.system_complete`]

```
path system_complete(const path& p);
path system_complete(const path& p, error_code& ec);
```

<sup>1</sup> *Effects:* Composes an absolute path from `p`, using the same rules used by the operating system to resolve a path passed as the filename argument to standard library open functions.

- 2 *Returns:* The composed path. The signature with argument `ec` returns `path()` if an error occurs.
- 3 *Postcondition:* For the returned path, `rp`, `rp.is_absolute()` is `true`.
- 4 *Throws:* As specified in Error reporting (27.10.7).
- 5 [*Example:* For POSIX based operating systems, `system_complete(p)` has the same semantics as `absolute(p, current_path())`.
- 6 For Windows based operating systems, `system_complete(p)` has the same semantics as `absolute(p, current_path())` if `p.is_absolute()` || `!p.has_root_name()` or `p` and `base` have the same `root_name()`. Otherwise `system_complete(p)` acts as if `absolute(p, cwd)` is the current directory for the `p.root_name()` drive. For programs run by the command processor, however, the current directory for the `p.root_name()` drive may have been set by prior program, and this may have unintended consequences. — *end example*]

### 27.10.15.37 Temporary directory path

[fs.op.temp\_dir\_path]

```
path temp_directory_path();
path temp_directory_path(error_code& ec);
```

- 1 *Returns:* An unspecified directory path suitable for temporary files. An error shall be reported if `!exists(p)` || `!is_directory(p)`, where `p` is the path to be returned. The signature with argument `ec` returns `path()` if an error occurs.
- 2 *Throws:* As specified in Error reporting (27.10.7).
- 3 [*Example:* For POSIX based operating systems, an implementation might return the path supplied by the first environment variable found in the list `TMPDIR`, `TMP`, `TEMP`, `TEMPDIR`, or if none of these are found, `"/tmp"`.
- 4 For Windows based operating systems, an implementation might return the path reported by the Windows `GetTempPath` API function. — *end example*]

## 27.11 C library files

[c.files]

- 1 Table 151 describes header `<cstdio>`. [ *Note:* C++ does not define the function `gets`. — *end note* ]

Table 151 — Header `<cstdio>` synopsis

| Type         | Name(s)      |          |                |          |           |
|--------------|--------------|----------|----------------|----------|-----------|
| Macros:      |              |          |                |          |           |
| BUFSIZ       | FOPEN_MAX    | SEEK_CUR | TMP_MAX        | _IONBF   | stdout    |
| EOF          | L_tmpnam     | SEEK_END | _IOFBF         | stderr   |           |
| FILENAME_MAX | NULL <stdio> | SEEK_SET | _IOLBF         | stdin    |           |
| Types:       | FILE         | fpos_t   | size_t <stdio> |          |           |
| Functions:   |              |          |                |          |           |
| clearerr     | fopen        | fsetpos  | putchar        | snprintf | vscanf    |
| fclose       | fprintf      | ftell    | puts           | sprintf  | vsnprintf |
| feof         | fputc        | fwrite   | remove         | sscanf   | vsprintf  |
| ferror       | fputs        | getc     | rename         | tmpfile  | vsscanf   |
| fflush       | fread        | getchar  | rewind         | tmpnam   |           |
| fgetc        | freopen      | perror   | scanf          | ungetc   |           |
| fgetpos      | fscanf       | printf   | setbuf         | vfprintf |           |
| fgets        | fseek        | putc     | setvbuf        | vprintf  |           |

- 2 Calls to the function `tmpnam` with an argument of `NULL` may introduce a data race (17.6.5.9) with other calls to `tmpnam` with an argument of `NULL`.

SEE ALSO: ISO C 7.9, Amendment 1 4.6.2.

- 3 Table 152 describes header `<stdint.h>`. [*Note: The macros defined by `<stdint.h>` are provided unconditionally. In particular, the symbol `__STDC_FORMAT_MACROS`, mentioned in footnote 182 of the C standard, plays no role in C++. — end note*]

Table 152 — Header `<stdint.h>` synopsis

| Type                                     | Name(s)                                                            |
|------------------------------------------|--------------------------------------------------------------------|
| <b>Macros:</b>                           |                                                                    |
| PRI{d i o u x X}[FAST LEAST]{8 16 32 64} |                                                                    |
| PRI{d i o u x X}{MAX PTR}                |                                                                    |
| SCN{d i o u x}[FAST LEAST]{8 16 32 64}   |                                                                    |
| SCN{d i o u x}{MAX PTR}                  |                                                                    |
| <b>Types:</b> <code>imaxdiv_t</code>     |                                                                    |
| <b>Functions:</b>                        |                                                                    |
| <code>abs</code>                         | <code>imaxabs</code> <code>strtoimax</code> <code>wcstoimax</code> |
| <code>div</code>                         | <code>imaxdiv</code> <code>strtoumax</code> <code>wcstoumax</code> |

- 4 The contents of header `<stdint.h>` are the same as the Standard C Library header `<stdint.h>`, with the following changes:

- (4.1) — the header `<stdint.h>` includes the header `<stdint.h>` instead of `<stdint.h>`, and
- (4.2) — if and only if the type `intmax_t` designates an extended integer type (3.9.1), the following function signatures are added:

```
intmax_t abs(intmax_t);
imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `intmax_t imaxabs(intmax_t)` and `imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

## 28 Regular expressions library [re]

### 28.1 General [re.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.
- <sup>2</sup> The following subclauses describe a basic regular expression class template and its traits that can handle char-like (21.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as described in Table 153.

Table 153 — Regular expressions library summary

|                       | Subclause                   | Header(s)                  |
|-----------------------|-----------------------------|----------------------------|
| <a href="#">28.2</a>  | Definitions                 |                            |
| <a href="#">28.3</a>  | Requirements                |                            |
| <a href="#">28.5</a>  | Constants                   |                            |
| <a href="#">28.6</a>  | Exception type              |                            |
| <a href="#">28.7</a>  | Traits                      |                            |
| <a href="#">28.8</a>  | Regular expression template | <code>&lt;regex&gt;</code> |
| <a href="#">28.9</a>  | Submatches                  |                            |
| <a href="#">28.10</a> | Match results               |                            |
| <a href="#">28.11</a> | Algorithms                  |                            |
| <a href="#">28.12</a> | Iterators                   |                            |
| <a href="#">28.13</a> | Grammar                     |                            |

### 28.2 Definitions [re.def]

- <sup>1</sup> The following definitions shall apply to this Clause:

#### 28.2.1 [defns.regex.collating.element]

##### collating element

a sequence of one or more characters within the current locale that collate as if they were a single character.

#### 28.2.2 [defns.regex.finite.state.machine]

##### finite state machine

an unspecified data structure that is used to represent a regular expression, and which permits efficient matches against the regular expression to be obtained.

#### 28.2.3 [defns.regex.format.specifier]

##### format specifier

a sequence of one or more characters that is to be replaced with some part of a regular expression match.

#### 28.2.4 [defns.regex.matched]

##### matched

a sequence of zero or more characters is matched by a regular expression when the characters in the sequence correspond to a sequence of characters defined by the pattern.

### 28.2.5 [defns.regex.primary.equivalence.class] primary equivalence class

a set of one or more characters which share the same primary sort key: that is the sort key weighting that depends only upon character shape, and not accents, case, or locale specific tailorings.

### 28.2.6 [defns.regex.regular.expression] regular expression

a pattern that selects specific strings from a set of character strings.

### 28.2.7 [defns.regex.subexpression] sub-expression

a subset of a regular expression that has been marked by parenthesis.

## 28.3 Requirements [re.req]

- <sup>1</sup> This subclause defines requirements on classes representing regular expression traits. [ *Note:* The class template `regex_traits`, defined in Clause 28.7, satisfies these requirements. — *end note* ]
- <sup>2</sup> The class template `basic_regex`, defined in Clause 28.8, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member typedefs and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.
- <sup>3</sup> To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.
- <sup>4</sup> In Table 154 `X` denotes a traits class defining types and functions for the character container type `charT`; `u` is an object of type `X`; `v` is an object of type `const X`; `p` is a value of type `const charT*`; `I1` and `I2` are input iterators (24.2.3); `F1` and `F2` are forward iterators (24.2.5); `c` is a value of type `const charT`; `s` is an object of type `X::string_type`; `cs` is an object of type `const X::string_type`; `b` is a value of type `bool`; `I` is a value of type `int`; `cl` is an object of type `X::char_class_type`, and `loc` is an object of type `X::locale_type`.

Table 154 — Regular expression traits class requirements

| Expression                      | Return type                                 | Assertion/note pre-/post-condition                                                                                                                                        |
|---------------------------------|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>X::char_type</code>       | <code>charT</code>                          | The character container type used in the implementation of class template <code>basic_regex</code> .                                                                      |
| <code>X::string_type</code>     | <code>std::basic_string&lt;charT&gt;</code> |                                                                                                                                                                           |
| <code>X::locale_type</code>     | A copy constructible type                   | A type that represents the locale used by the traits class.                                                                                                               |
| <code>X::char_class_type</code> | A bitmask type (17.5.2.1.3).                | A bitmask type representing a particular character classification.                                                                                                        |
| <code>X::length(p)</code>       | <code>std::size_t</code>                    | Yields the smallest <code>i</code> such that <code>p[i] == 0</code> . Complexity is linear in <code>i</code> .                                                            |
| <code>v.translate(c)</code>     | <code>X::char_type</code>                   | Returns a character such that for any character <code>d</code> that is to be considered equivalent to <code>c</code> then <code>v.translate(c) == v.translate(d)</code> . |

Table 154 — Regular expression traits class requirements (continued)

| Expression                                 | Return type                     | Assertion/note pre-/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>v.translate_nocase(c)</code>         | <code>X::char_type</code>       | For all characters <code>C</code> that are to be considered equivalent to <code>c</code> when comparisons are to be performed without regard to case, then<br><code>v.translate_nocase(c) == v.translate_nocase(C)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>v.transform(F1, F2)</code>           | <code>X::string_type</code>     | Returns a sort key for the character sequence designated by the iterator range <code>[F1, F2)</code> such that if the character sequence <code>[G1, G2)</code> sorts before the character sequence <code>[H1, H2)</code> then <code>v.transform(G1, G2) &lt; v.transform(H1, H2)</code> .                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>v.transform_primary(F1, F2)</code>   | <code>X::string_type</code>     | Returns a sort key for the character sequence designated by the iterator range <code>[F1, F2)</code> such that if the character sequence <code>[G1, G2)</code> sorts before the character sequence <code>[H1, H2)</code> when character case is not considered then <code>v.transform_primary(G1, G2) &lt; v.transform_primary(H1, H2)</code> .                                                                                                                                                                                                                                                                                                                                |
| <code>v.lookup_collatename(F1, F2)</code>  | <code>X::string_type</code>     | Returns a sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range <code>[F1, F2)</code> . Returns an empty string if the character sequence is not a valid collating element.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>v.lookup_classname(F1, F2, b)</code> | <code>X::char_class_type</code> | Converts the character sequence designated by the iterator range <code>[F1, F2)</code> into a value of a bitmask type that can subsequently be passed to <code>isctype</code> . Values returned from <code>lookup_classname</code> can be bitwise or'ed together; the resulting value represents membership in either of the corresponding character classes. If <code>b</code> is true, the returned bitmask is suitable for matching characters without regard to their case. Returns 0 if the character sequence is not the name of a character class recognized by <code>X</code> . The value returned shall be independent of the case of the characters in the sequence. |
| <code>v.isctype(c, cl)</code>              | <code>bool</code>               | Returns <code>true</code> if character <code>c</code> is a member of one of the character classes designated by <code>cl</code> , <code>false</code> otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>v.value(c, I)</code>                 | <code>int</code>                | Returns the value represented by the digit <code>c</code> in base <code>I</code> if the character <code>c</code> is a valid digit in base <code>I</code> ; otherwise returns <code>-1</code> . [Note: The value of <code>I</code> will only be 8, 10, or 16. — end note]                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 154 — Regular expression traits class requirements (continued)

| Expression                | Return type                 | Assertion/note pre-/post-condition                                                                                    |
|---------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>u.imbue(loc)</code> | <code>X::locale_type</code> | Imbues <code>u</code> with the locale <code>loc</code> and returns the previous locale used by <code>u</code> if any. |
| <code>v.getloc()</code>   | <code>X::locale_type</code> | Returns the current locale used by <code>v</code> , if any.                                                           |

<sup>5</sup> [ *Note:* Class template `regex_traits` satisfies the requirements for a regular expression traits class when it is specialized for `char` or `wchar_t`. This class template is described in the header `<regex>`, and is described in Clause 28.7. — *end note* ]

## 28.4 Header `<regex>` synopsis

[re.syn]

```
#include <initializer_list>

namespace std {

    // 28.5, regex constants:
    namespace regex_constants {
        enum error_type;
    } // namespace regex_constants

    // 28.6, class regex_error:
    class regex_error;

    // 28.7, class template regex_traits:
    template <class charT> struct regex_traits;

    // 28.8, class template basic_regex:
    template <class charT, class traits = regex_traits<charT> > class basic_regex;

    typedef basic_regex<char>      regex;
    typedef basic_regex<wchar_t> wregex;

    // 28.8.6, basic_regex swap:
    template <class charT, class traits>
        void swap(basic_regex<charT, traits>& e1, basic_regex<charT, traits>& e2);

    // 28.9, class template sub_match:
    template <class BidirectionalIterator>
        class sub_match;

## 28.5 Namespace `std::regex_constants`

[re.const]

- <sup>1</sup> The namespace `std::regex_constants` holds symbolic constants used by the regular expression library. This namespace provides three types, `syntax_option_type`, `match_flag_type`, and `error_type`, along with several constants of these types.

### 28.5.1 Bitmask type `syntax_option_type`

[re.synopt]

```

namespace std::regex_constants {
    typedef T1 syntax_option_type;
    constexpr syntax_option_type icalse = unspecified;
    constexpr syntax_option_type nosubs = unspecified;
    constexpr syntax_option_type optimize = unspecified;
    constexpr syntax_option_type collate = unspecified;
    constexpr syntax_option_type ECMAScript = unspecified;
    constexpr syntax_option_type basic = unspecified;
    constexpr syntax_option_type extended = unspecified;
    constexpr syntax_option_type awk = unspecified;
    constexpr syntax_option_type grep = unspecified;
    constexpr syntax_option_type egrep = unspecified;
}

```

- <sup>1</sup> The type `syntax_option_type` is an implementation-defined bitmask type (17.5.2.1.3). Setting its elements has the effects listed in table 155. A valid value of type `syntax_option_type` shall have at most one of the grammar elements ECMAScript, basic, extended, awk, grep, egrep, set. If no grammar element is set, the default grammar is ECMAScript.

### 28.5.2 Bitmask type `regex_constants::match_flag_type`

[re.matchflag]

```

namespace std::regex_constants {
    typedef T2 match_flag_type;
    constexpr match_flag_type match_default = {};
    constexpr match_flag_type match_not_bol = unspecified;
    constexpr match_flag_type match_not_eol = unspecified;
    constexpr match_flag_type match_not_bow = unspecified;
    constexpr match_flag_type match_not_eow = unspecified;
}

```

Table 155 — `syntax_option_type` effects

| Element                 | Effect(s) if set                                                                                                                                                                                                                                                          |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>icase</code>      | Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.                                                                                                                                          |
| <code>nosubs</code>     | Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied <code>match_results</code> structure.                  |
| <code>optimize</code>   | Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output. |
| <code>collate</code>    | Specifies that character ranges of the form "[a-b]" shall be locale sensitive.                                                                                                                                                                                            |
| <code>ECMAScript</code> | Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in 28.13.                                                                                                                                |
| <code>basic</code>      | Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX, Base Definitions and Headers, Section 9, Regular Expressions.                                                                            |
| <code>extended</code>   | Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX, Base Definitions and Headers, Section 9, Regular Expressions.                                                                         |
| <code>awk</code>        | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>awk</code> in POSIX.                                                                                                                                       |
| <code>grep</code>       | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>grep</code> in POSIX.                                                                                                                                      |
| <code>egrep</code>      | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>grep</code> when given the <code>-E</code> option in POSIX.                                                                                                |

```

constexpr match_flag_type match_any = unspecified;
constexpr match_flag_type match_not_null = unspecified;
constexpr match_flag_type match_continuous = unspecified;
constexpr match_flag_type match_prev_avail = unspecified;
constexpr match_flag_type format_default = {};
constexpr match_flag_type format_sed = unspecified;
constexpr match_flag_type format_no_copy = unspecified;
constexpr match_flag_type format_first_only = unspecified;
}

```

- <sup>1</sup> The type `regex_constants::match_flag_type` is an implementation-defined bitmask type (17.5.2.1.3). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters [`first`, `last`) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 156 for any bitmask elements set.

Table 156 — `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence [`first`, `last`).

| Element                        | Effect(s) if set                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>match_not_bol</code>     | The first character in the sequence [ <code>first</code> , <code>last</code> ) shall be treated as though it is not at the beginning of a line, so the character <code>^</code> in the regular expression shall not match [ <code>first</code> , <code>first</code> ).                                                                                                                                                                                                                    |
| <code>match_not_eol</code>     | The last character in the sequence [ <code>first</code> , <code>last</code> ) shall be treated as though it is not at the end of a line, so the character <code>"\$"</code> in the regular expression shall not match [ <code>last</code> , <code>last</code> ).                                                                                                                                                                                                                          |
| <code>match_not_bow</code>     | The expression <code>"\\b"</code> shall not match the sub-sequence [ <code>first</code> , <code>first</code> ).                                                                                                                                                                                                                                                                                                                                                                           |
| <code>match_not_eow</code>     | The expression <code>"\\b"</code> shall not match the sub-sequence [ <code>last</code> , <code>last</code> ).                                                                                                                                                                                                                                                                                                                                                                             |
| <code>match_any</code>         | If more than one match is possible then any match is an acceptable result.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>match_not_null</code>    | The expression shall not match an empty sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>match_continuous</code>  | The expression shall only match a sub-sequence that begins at <code>first</code> .                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>match_prev_avail</code>  | <code>--first</code> is a valid iterator position. When this flag is set the flags <code>match_not_bol</code> and <code>match_not_bow</code> shall be ignored by the regular expression algorithms 28.11 and iterators 28.12.                                                                                                                                                                                                                                                             |
| <code>format_default</code>    | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 <code>String.prototype.replace</code> . In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string. |
| <code>format_sed</code>        | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the <code>sed</code> utility in POSIX.                                                                                                                                                                                                                                                                                                                     |
| <code>format_no_copy</code>    | During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.                                                                                                                                                                                                                                                                                                     |
| <code>format_first_only</code> | When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.                                                                                                                                                                                                                                                                                                                                                              |

### 28.5.3 Implementation-defined `error_type`

[`re.err`]

```
namespace std::regex_constants {
    typedef T3 error_type;
    constexpr error_type error_collate = unspecified;
    constexpr error_type error_ctype = unspecified;
    constexpr error_type error_escape = unspecified;
    constexpr error_type error_backref = unspecified;
    constexpr error_type error_brack = unspecified;
    constexpr error_type error_paren = unspecified;
    constexpr error_type error_brace = unspecified;
    constexpr error_type error_badbrace = unspecified;
    constexpr error_type error_range = unspecified;
    constexpr error_type error_space = unspecified;
    constexpr error_type error_badrepeat = unspecified;
    constexpr error_type error_complexity = unspecified;
    constexpr error_type error_stack = unspecified;
}
```

- <sup>1</sup> The type `error_type` is an implementation-defined enumerated type (17.5.2.1.2). Values of type `error_type` represent the error conditions described in Table 157:

Table 157 — `error_type` values in the C locale

| Value                         | Error condition                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>error_collate</code>    | The expression contained an invalid collating element name.                                                             |
| <code>error_ctype</code>      | The expression contained an invalid character class name.                                                               |
| <code>error_escape</code>     | The expression contained an invalid escaped character, or a trailing escape.                                            |
| <code>error_backref</code>    | The expression contained an invalid back reference.                                                                     |
| <code>error_brack</code>      | The expression contained mismatched [ and ].                                                                            |
| <code>error_paren</code>      | The expression contained mismatched ( and ).                                                                            |
| <code>error_brace</code>      | The expression contained mismatched { and }.                                                                            |
| <code>error_badbrace</code>   | The expression contained an invalid range in a {} expression.                                                           |
| <code>error_range</code>      | The expression contained an invalid character range, such as [b-a] in most encodings.                                   |
| <code>error_space</code>      | There was insufficient memory to convert the expression into a finite state machine.                                    |
| <code>error_badrepeat</code>  | One of *?+{ was not preceded by a valid regular expression.                                                             |
| <code>error_complexity</code> | The complexity of an attempted match against a regular expression exceeded a pre-set level.                             |
| <code>error_stack</code>      | There was insufficient memory to determine whether the regular expression could match the specified character sequence. |

## 28.6 Class `regex_error`

[re.badexp]

```
class regex_error : public std::runtime_error {
public:
    explicit regex_error(regex_constants::error_type ecode);
    regex_constants::error_type code() const;
};
```

- <sup>1</sup> The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```
regex_error(regex_constants::error_type ecode);
```

- <sup>2</sup> *Effects:* Constructs an object of class `regex_error`.

- <sup>3</sup> *Postcondition:* `ecode == code()`

```
regex_constants::error_type code() const;
```

- <sup>4</sup> *Returns:* The error code that was passed to the constructor.

## 28.7 Class template `regex_traits`

[re.traits]

```
namespace std {
    template <class charT>
    struct regex_traits {
    public:
        typedef charT          char_type;
        typedef std::basic_string<char_type> string_type;
        typedef std::locale     locale_type;
        typedef bitmask_type    char_class_type;
```

```

    regex_traits();
    static std::size_t length(const char_type* p);
    charT translate(charT c) const;
    charT translate_nocase(charT c) const;
    template <class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
    template <class ForwardIterator>
        string_type transform_primary(
            ForwardIterator first, ForwardIterator last) const;
    template <class ForwardIterator>
        string_type lookup_collatename(
            ForwardIterator first, ForwardIterator last) const;
    template <class ForwardIterator>
        char_class_type lookup_classname(
            ForwardIterator first, ForwardIterator last, bool icalse = false) const;
    bool isctype(charT c, char_class_type f) const;
    int value(charT ch, int radix) const;
    locale_type imbue(locale_type l);
    locale_type getloc() const;
};
}

```

- <sup>1</sup> The specializations `regex_traits<char>` and `regex_traits<wchar_t>` shall be valid and shall satisfy the requirements for a regular expression traits class (28.3).

```
typedef bitmask_type      char_class_type;
```

- <sup>2</sup> The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```
static std::size_t length(const char_type* p);
```

- <sup>3</sup> *Returns:* `char_traits<charT>::length(p)`.

```
charT translate(charT c) const;
```

- <sup>4</sup> *Returns:* `(c)`.

```
charT translate_nocase(charT c) const;
```

- <sup>5</sup> *Returns:* `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```
template <class ForwardIterator>
    string_type transform(ForwardIterator first, ForwardIterator last) const;
```

- <sup>6</sup> *Effects:* As if by:

```

    string_type str(first, last);
    return use_facet<collate<charT>>(
        getloc()).transform(&*str.begin(), &*str.begin() + str.length());

```

```

template <class ForwardIterator>
    string_type transform_primary(ForwardIterator first, ForwardIterator last) const;

```

- <sup>7</sup> *Effects:* If `typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)` and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

```
template <class ForwardIterator>
    string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
```

- 8 *Returns:* a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [first, last). Returns an empty string if the character sequence is not a valid collating element.

```
template <class ForwardIterator>
    char_class_type lookup_classname(
        ForwardIterator first, ForwardIterator last, bool icase = false) const;
```

- 9 *Returns:* an unspecified value that represents the character classification named by the character sequence designated by the iterator range [first, last). If the parameter `icase` is true then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.<sup>337</sup> The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.
- 10 *Remarks:* For `regex_traits<char>`, at least the narrow character names in Table 158 shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in Table 158 shall be recognized.

```
bool isctype(charT c, char_class_type f) const;
```

- 11 *Effects:* Determines if the character `c` is a member of the character classification represented by `f`.
- 12 *Returns:* Given the following function declaration:

```
// for exposition only
template<class C>
    ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
```

that returns a value in which each `ctype_base::mask` value corresponding to a value in `f` named in Table 158 is set, then the result is determined as if by:

```
ctype_base::mask m = convert<charT>(f);
const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
if (ct.is(m, c)) {
    return true;
} else if (c == ct.widen('_')) {
    charT w[1] = { ct.widen('w') };
    char_class_type x = lookup_classname(w, w+1);

    return (f&x) == x;
} else {
    return false;
}
```

[Example:

```
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
```

337) For example, if the parameter `icase` is true then `[[:lower:]]` is the same as `[[:alpha:]]`.

— end example] [Example:

```
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f); // returns true
t.isctype('_', f); // returns true
t.isctype(' ', f); // returns false
```

— end example]

```
int value(charT ch, int radix) const;
```

13 *Requires:* The value of *radix* shall be 8, 10, or 16.

14 *Returns:* the value represented by the digit *ch* in base *radix* if the character *ch* is a valid digit in base *radix*; otherwise returns -1.

```
locale_type imbue(locale_type loc);
```

15 *Effects:* Imbues **this** with a copy of the locale *loc*. [Note: Calling **imbue** with a different locale than the one currently in use invalidates all cached data held by **\*this**. — end note]

16 *Returns:* if no locale has been previously imbued then a copy of the global locale in effect at the time of construction of **\*this**, otherwise a copy of the last argument passed to **imbue**.

17 *Postcondition:* **getloc() == loc**.

```
locale_type getloc() const;
```

18 *Returns:* if no locale has been imbued then a copy of the global locale in effect at the time of construction of **\*this**, otherwise a copy of the last argument passed to **imbue**.

Table 158 — Character class names and corresponding **ctype** masks

| Narrow character name | Wide character name | Corresponding <b>ctype_base::mask</b> value |
|-----------------------|---------------------|---------------------------------------------|
| "alnum"               | L"alnum"            | <b>ctype_base::alnum</b>                    |
| "alpha"               | L"alpha"            | <b>ctype_base::alpha</b>                    |
| "blank"               | L"blank"            | <b>ctype_base::blank</b>                    |
| "cntrl"               | L"cntrl"            | <b>ctype_base::cntrl</b>                    |
| "digit"               | L"digit"            | <b>ctype_base::digit</b>                    |
| "d"                   | L"d"                | <b>ctype_base::digit</b>                    |
| "graph"               | L"graph"            | <b>ctype_base::graph</b>                    |
| "lower"               | L"lower"            | <b>ctype_base::lower</b>                    |
| "print"               | L"print"            | <b>ctype_base::print</b>                    |
| "punct"               | L"punct"            | <b>ctype_base::punct</b>                    |
| "space"               | L"space"            | <b>ctype_base::space</b>                    |
| "s"                   | L"s"                | <b>ctype_base::space</b>                    |
| "upper"               | L"upper"            | <b>ctype_base::upper</b>                    |
| "w"                   | L"w"                | <b>ctype_base::alnum</b>                    |
| "xdigit"              | L"xdigit"           | <b>ctype_base::xdigit</b>                   |

## 28.8 Class template `basic_regex` [re.regex]

- <sup>1</sup> For a char-like type `charT`, specializations of class template `basic_regex` represent regular expressions constructed from character sequences of `charT` characters. In the rest of 28.8, `charT` denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class `basic_regex`.
- <sup>2</sup> Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions. [*Note: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this — end note*]
- <sup>3</sup> The functions described in this Clause report errors by throwing exceptions of type `regex_error`.

```
namespace std {
    template <class charT,
               class traits = regex_traits<charT> >
    class basic_regex {
    public:
        // types:
        typedef          charT                      value_type;
        typedef          traits                      traits_type;
        typedef typename traits::string_type        string_type;
        typedef          regex_constants::syntax_option_type flag_type;
        typedef typename traits::locale_type        locale_type;

        // 28.8.1, constants:
        static constexpr regex_constants::syntax_option_type
            icase = regex_constants::icase;
        static constexpr regex_constants::syntax_option_type
            nosubs = regex_constants::nosubs;
        static constexpr regex_constants::syntax_option_type
            optimize = regex_constants::optimize;
        static constexpr regex_constants::syntax_option_type
            collate = regex_constants::collate;
        static constexpr regex_constants::syntax_option_type
            ECMAScript = regex_constants::ECMAScript;
        static constexpr regex_constants::syntax_option_type
            basic = regex_constants::basic;
        static constexpr regex_constants::syntax_option_type
            extended = regex_constants::extended;
        static constexpr regex_constants::syntax_option_type
            awk = regex_constants::awk;
        static constexpr regex_constants::syntax_option_type
            grep = regex_constants::grep;
        static constexpr regex_constants::syntax_option_type
            egrep = regex_constants::egrep;

        // 28.8.2, construct/copy/destroy:
        basic_regex();
        explicit basic_regex(const charT* p,
                           flag_type f = regex_constants::ECMAScript);
        basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
        basic_regex(const basic_regex&);
        basic_regex(basic_regex&&) noexcept;
        template <class ST, class SA>
            explicit basic_regex(const basic_string<charT, ST, SA>& p,
```

```

        flag_type f = regex_constants::ECMAScript);
template <class ForwardIterator>
    basic_regex(ForwardIterator first, ForwardIterator last,
        flag_type f = regex_constants::ECMAScript);
basic_regex(initializer_list<charT>,
    flag_type = regex_constants::ECMAScript);

~basic_regex();

basic_regex& operator=(const basic_regex&);
basic_regex& operator=(basic_regex&&) noexcept;
basic_regex& operator=(const charT* ptr);
basic_regex& operator=(initializer_list<charT> il);
template <class ST, class SA>
    basic_regex& operator=(const basic_string<charT, ST, SA>& p);

// 28.8.3, assign:
basic_regex& assign(const basic_regex& that);
basic_regex& assign(basic_regex&& that) noexcept;
basic_regex& assign(const charT* ptr,
    flag_type f = regex_constants::ECMAScript);
basic_regex& assign(const charT* p, size_t len, flag_type f);
template <class string_traits, class A>
    basic_regex& assign(const basic_string<charT, string_traits, A>& s,
        flag_type f = regex_constants::ECMAScript);
template <class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
        flag_type f = regex_constants::ECMAScript);
basic_regex& assign(initializer_list<charT>,
    flag_type = regex_constants::ECMAScript);

// 28.8.4, const operations:
unsigned mark_count() const;
flag_type flags() const;

// 28.8.5, locale:
locale_type imbue(locale_type loc);
locale_type getloc() const;

// 28.8.6, swap:
void swap(basic_regex&);
};
}

```

## 28.8.1 basic\_regex constants

[re.regex.const]

```

static constexpr regex_constants::syntax_option_type
    icode = regex_constants::icode;
static constexpr regex_constants::syntax_option_type
    nosubs = regex_constants::nosubs;
static constexpr regex_constants::syntax_option_type
    optimize = regex_constants::optimize;
static constexpr regex_constants::syntax_option_type
    collate = regex_constants::collate;
static constexpr regex_constants::syntax_option_type

```

```

    ECMA_Script = regex_constants::ECMA_Script;
    static constexpr regex_constants::syntax_option_type
        basic = regex_constants::basic;
    static constexpr regex_constants::syntax_option_type
        extended = regex_constants::extended;
    static constexpr regex_constants::syntax_option_type
        awk = regex_constants::awk;
    static constexpr regex_constants::syntax_option_type
        grep = regex_constants::grep;
    static constexpr regex_constants::syntax_option_type
        egrep = regex_constants::egrep;

```

- <sup>1</sup> The static constant members are provided as synonyms for the constants declared in namespace `regex_constants`.

## 28.8.2 basic\_regex constructors

[re.regex.construct]

```
basic_regex();
```

- <sup>1</sup> *Effects:* Constructs an object of class `basic_regex` that does not match any character sequence.

```
explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMA_Script);
```

- <sup>2</sup> *Requires:* `p` shall not be a null pointer.

- <sup>3</sup> *Throws:* `regex_error` if `p` is not a valid regular expression.

- <sup>4</sup> *Effects:* Constructs an object of class `basic_regex`; the object's internal finite state machine is constructed from the regular expression contained in the array of `charT` of length `char_traits<charT>::length(p)` whose first element is designated by `p`, and interpreted according to the flags `f`.

- <sup>5</sup> *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

```
basic_regex(const charT* p, size_t len, flag_type f);
```

- <sup>6</sup> *Requires:* `p` shall not be a null pointer.

- <sup>7</sup> *Throws:* `regex_error` if `p` is not a valid regular expression.

- <sup>8</sup> *Effects:* Constructs an object of class `basic_regex`; the object's internal finite state machine is constructed from the regular expression contained in the sequence of characters `[p, p+len)`, and interpreted according the flags specified in `f`.

- <sup>9</sup> *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

```
basic_regex(const basic_regex& e);
```

- <sup>10</sup> *Effects:* Constructs an object of class `basic_regex` as a copy of the object `e`.

- <sup>11</sup> *Postconditions:* `flags()` and `mark_count()` return `e.flags()` and `e.mark_count()`, respectively.

```
basic_regex(basic_regex&& e) noexcept;
```

- <sup>12</sup> *Effects:* Move constructs an object of class `basic_regex` from `e`.

- <sup>13</sup> *Postconditions:* `flags()` and `mark_count()` return the values that `e.flags()` and `e.mark_count()`, respectively, had before construction. `e` is in a valid state with unspecified value.

```

template <class ST, class SA>
    explicit basic_regex(const basic_string<charT, ST, SA>& s,
                        flag_type f = regex_constants::ECMA_Script);

```

- 14 *Throws:* `regex_error` if `s` is not a valid regular expression.
- 15 *Effects:* Constructs an object of class `basic_regex`; the object's internal finite state machine is constructed from the regular expression contained in the string `s`, and interpreted according to the flags specified in `f`.
- 16 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

```
template <class ForwardIterator>
    basic_regex(ForwardIterator first, ForwardIterator last,
                flag_type f = regex_constants::ECMAScript);
```

- 17 *Throws:* `regex_error` if the sequence `[first, last)` is not a valid regular expression.
- 18 *Effects:* Constructs an object of class `basic_regex`; the object's internal finite state machine is constructed from the regular expression contained in the sequence of characters `[first, last)`, and interpreted according to the flags specified in `f`.
- 19 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

```
basic_regex(initializer_list<charT> il,
            flag_type f = regex_constants::ECMAScript);
```

- 20 *Effects:* Same as `basic_regex(il.begin(), il.end(), f)`.

### 28.8.3 `basic_regex` assign

[re.regex.assign]

```
basic_regex& operator=(const basic_regex& e);
```

- 1 *Effects:* Copies `e` into `*this` and returns `*this`.
- 2 *Postconditions:* `flags()` and `mark_count()` return `e.flags()` and `e.mark_count()`, respectively.

```
basic_regex& operator=(basic_regex&& e) noexcept;
```

- 3 *Effects:* Move assigns from `e` into `*this` and returns `*this`.
- 4 *Postconditions:* `flags()` and `mark_count()` return the values that `e.flags()` and `e.mark_count()`, respectively, had before assignment. `e` is in a valid state with unspecified value.

```
basic_regex& operator=(const charT* ptr);
```

- 5 *Requires:* `ptr` shall not be a null pointer.
- 6 *Effects:* Returns `assign(ptr)`.

```
basic_regex& operator=(initializer_list<charT> il);
```

- 7 *Effects:* Returns `assign(il.begin(), il.end())`.

```
template <class ST, class SA>
    basic_regex& operator=(const basic_string<charT, ST, SA>& p);
```

- 8 *Effects:* Returns `assign(p)`.

```
basic_regex& assign(const basic_regex& that);
```

- 9 *Effects:* Equivalent to `*this = that`.
- 10 *Returns:* `*this`.

```
basic_regex& assign(basic_regex&& that) noexcept;
```

11 *Effects:* Equivalent to `*this = std::move(that)`.

12 *Returns:* `*this`.

```
basic_regex& assign(const charT* ptr, flag_type f = regex_constants::ECMAScript);
```

13 *Returns:* `assign(string_type(ptr), f)`.

```
basic_regex& assign(const charT* ptr, size_t len,
    flag_type f = regex_constants::ECMAScript);
```

14 *Returns:* `assign(string_type(ptr, len), f)`.

```
template <class string_traits, class A>
    basic_regex& assign(const basic_string<charT, string_traits, A>& s,
        flag_type f = regex_constants::ECMAScript);
```

15 *Throws:* `regex_error` if `s` is not a valid regular expression.

16 *Returns:* `*this`.

17 *Effects:* Assigns the regular expression contained in the string `s`, interpreted according the flags specified in `f`. If an exception is thrown, `*this` is unchanged.

18 *Postconditions:* If no exception is thrown, `flags()` returns `f` and `mark_count()` returns the number of marked sub-expressions within the expression.

```
template <class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
        flag_type f = regex_constants::ECMAScript);
```

19 *Requires:* The type `InputIterator` shall satisfy the requirements for an Input Iterator (24.2.3).

20 *Returns:* `assign(string_type(first, last), f)`.

```
basic_regex& assign(initializer_list<charT> il,
    flag_type f = regex_constants::ECMAScript);
```

21 *Effects:* Same as `assign(il.begin(), il.end(), f)`.

22 *Returns:* `*this`.

#### 28.8.4 `basic_regex` constant operations

[re.regex.operations]

```
unsigned mark_count() const;
```

1 *Effects:* Returns the number of marked sub-expressions within the regular expression.

```
flag_type flags() const;
```

2 *Effects:* Returns a copy of the regular expression syntax flags that were passed to the object's constructor or to the last call to `assign`.

#### 28.8.5 `basic_regex` locale

[re.regex.locale]

```
locale_type imbue(locale_type loc);
```

1 *Effects:* Returns the result of `traits_inst.imbue(loc)` where `traits_inst` is a (default-initialized) instance of the template type argument `traits` stored within the object. After a call to `imbue` the `basic_regex` object does not match any character sequence.

```
locale_type getloc() const;
```

2 *Effects:* Returns the result of `traits_inst.getloc()` where `traits_inst` is a (default-initialized) instance of the template parameter `traits` stored within the object.

**28.8.6 basic\_regex swap****[re.regex.swap]**

```
void swap(basic_regex& e);
```

- 1 *Effects:* Swaps the contents of the two regular expressions.
- 2 *Postcondition:* *\*this* contains the regular expression that was in *e*, *e* contains the regular expression that was in *\*this*.
- 3 *Complexity:* Constant time.

**28.8.7 basic\_regex non-member functions****[re.regex.nonmemb]****28.8.7.1 basic\_regex non-member swap****[re.regex.nmswap]**

```
template <class charT, class traits>
void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);
```

- 1 *Effects:* Calls *lhs.swap(rhs)*.

**28.9 Class template sub\_match****[re.submatch]**

- 1 Class template *sub\_match* denotes the sequence of characters matched by a particular marked sub-expression.

```
namespace std {
    template <class BidirectionalIterator>
    class sub_match : public std::pair<BidirectionalIterator, BidirectionalIterator> {
    public:
        typedef typename iterator_traits<BidirectionalIterator>::
            value_type value_type;
        typedef typename iterator_traits<BidirectionalIterator>::
            difference_type difference_type;
        typedef BidirectionalIterator iterator;
        typedef basic_string<value_type> string_type;

        bool matched;

        constexpr sub_match();

        difference_type length() const;
        operator string_type() const;
        string_type str() const;

        int compare(const sub_match& s) const;
        int compare(const string_type& s) const;
        int compare(const value_type* s) const;
    };
}
```

**28.9.1 sub\_match members****[re.submatch.members]**

```
constexpr sub_match();
```

- 1 *Effects:* Value-initializes the pair base class subobject and the member *matched*.

```
difference_type length() const;
```

- 2 *Returns:* (*matched* ? *distance(first, second)* : 0).

```
operator string_type() const;
```

3       *Returns:* matched ? string\_type(first, second) : string\_type().

string\_type str() const;

4       *Returns:* matched ? string\_type(first, second) : string\_type().

int compare(const sub\_match& s) const;

5       *Returns:* str().compare(s.str()).

int compare(const string\_type& s) const;

6       *Returns:* str().compare(s).

int compare(const value\_type\* s) const;

7       *Returns:* str().compare(s).

## 28.9.2 sub\_match non-member operators

[re.submatch.op]

```
template <class BiIter>
    bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

1       *Returns:* lhs.compare(rhs) == 0.

```
template <class BiIter>
    bool operator!=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

2       *Returns:* lhs.compare(rhs) != 0.

```
template <class BiIter>
    bool operator<(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

3       *Returns:* lhs.compare(rhs) < 0.

```
template <class BiIter>
    bool operator<=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

4       *Returns:* lhs.compare(rhs) <= 0.

```
template <class BiIter>
    bool operator>=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

5       *Returns:* lhs.compare(rhs) >= 0.

```
template <class BiIter>
    bool operator>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

6       *Returns:* lhs.compare(rhs) > 0.

```
template <class BiIter, class ST, class SA>
    bool operator==(
        const basic_string<
            typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
        const sub_match<BiIter>& rhs);
```

7       *Returns:* rhs.compare(typename sub\_match<BiIter>::string\_type(lhs.data(), lhs.size()))  
== 0.

```

template <class BiIter, class ST, class SA>
    bool operator!=(
        const basic_string<
            typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
            const sub_match<BiIter>& rhs);
8      Returns: !(lhs == rhs).

template <class BiIter, class ST, class SA>
    bool operator<(
        const basic_string<
            typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
            const sub_match<BiIter>& rhs);
9      Returns: rhs.compare(typename sub_match<BiIter>::string_type(lhs.data(), lhs.size()))
        > 0.

template <class BiIter, class ST, class SA>
    bool operator>(
        const basic_string<
            typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
            const sub_match<BiIter>& rhs);
10     Returns: rhs < lhs.

template <class BiIter, class ST, class SA>
    bool operator>=(
        const basic_string<
            typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
            const sub_match<BiIter>& rhs);
11     Returns: !(lhs < rhs).

template <class BiIter, class ST, class SA>
    bool operator<=(
        const basic_string<
            typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
            const sub_match<BiIter>& rhs);
12     Returns: !(rhs < lhs).

template <class BiIter, class ST, class SA>
    bool operator==(const sub_match<BiIter>& lhs,
                    const basic_string<
                        typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
13     Returns: lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size()))
        == 0.

template <class BiIter, class ST, class SA>
    bool operator!=(const sub_match<BiIter>& lhs,
                    const basic_string<
                        typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
14     Returns: !(lhs == rhs).

template <class BiIter, class ST, class SA>
    bool operator<(const sub_match<BiIter>& lhs,
                    const basic_string<
                        typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

```

15       *Returns:* lhs.compare(typename sub\_match<BiIter>::string\_type(rhs.data(), rhs.size()))  
           < 0.

```
template <class BiIter, class ST, class SA>
  bool operator>(const sub_match<BiIter>& lhs,
                 const basic_string<
                 typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

16       *Returns:* rhs < lhs.

```
template <class BiIter, class ST, class SA>
  bool operator>=(const sub_match<BiIter>& lhs,
                  const basic_string<
                  typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

17       *Returns:* !(lhs < rhs).

```
template <class BiIter, class ST, class SA>
  bool operator<=(const sub_match<BiIter>& lhs,
                  const basic_string<
                  typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

18       *Returns:* !(rhs < lhs).

```
template <class BiIter>
  bool operator==(typename iterator_traits<BiIter>::value_type const* lhs,
                  const sub_match<BiIter>& rhs);
```

19       *Returns:* rhs.compare(lhs) == 0.

```
template <class BiIter>
  bool operator!=(typename iterator_traits<BiIter>::value_type const* lhs,
                  const sub_match<BiIter>& rhs);
```

20       *Returns:* !(lhs == rhs).

```
template <class BiIter>
  bool operator<(typename iterator_traits<BiIter>::value_type const* lhs,
                 const sub_match<BiIter>& rhs);
```

21       *Returns:* rhs.compare(lhs) > 0.

```
template <class BiIter>
  bool operator>(typename iterator_traits<BiIter>::value_type const* lhs,
                 const sub_match<BiIter>& rhs);
```

22       *Returns:* rhs < lhs.

```
template <class BiIter>
  bool operator>=(typename iterator_traits<BiIter>::value_type const* lhs,
                  const sub_match<BiIter>& rhs);
```

23       *Returns:* !(lhs < rhs).

```
template <class BiIter>
  bool operator<=(typename iterator_traits<BiIter>::value_type const* lhs,
                  const sub_match<BiIter>& rhs);
```

24       *Returns:* !(rhs < lhs).

```

template <class BiIter>
    bool operator==(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const* rhs);
25     Returns: lhs.compare(rhs) == 0.

template <class BiIter>
    bool operator!=(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const* rhs);
26     Returns: !(lhs == rhs).

template <class BiIter>
    bool operator<(const sub_match<BiIter>& lhs,
                  typename iterator_traits<BiIter>::value_type const* rhs);
27     Returns: lhs.compare(rhs) < 0.

template <class BiIter>
    bool operator>(const sub_match<BiIter>& lhs,
                  typename iterator_traits<BiIter>::value_type const* rhs);
28     Returns: rhs < lhs.

template <class BiIter>
    bool operator>=(const sub_match<BiIter>& lhs,
                   typename iterator_traits<BiIter>::value_type const* rhs);
29     Returns: !(lhs < rhs).

template <class BiIter>
    bool operator<(typename iterator_traits<BiIter>::value_type const& lhs,
                  const sub_match<BiIter>& rhs);
33     Returns: rhs.compare(typename sub_match<BiIter>::string_type(1, lhs)) > 0.

template <class BiIter>
    bool operator>(typename iterator_traits<BiIter>::value_type const& lhs,
                  const sub_match<BiIter>& rhs);
34     Returns: rhs < lhs.

```

```
template <class BiIter>
    bool operator>=(typename iterator_traits<BiIter>::value_type const& lhs,
                    const sub_match<BiIter>& rhs);
```

35       *Returns:* !(lhs < rhs).

```
template <class BiIter>
    bool operator<=(typename iterator_traits<BiIter>::value_type const& lhs,
                    const sub_match<BiIter>& rhs);
```

36       *Returns:* !(rhs < lhs).

```
template <class BiIter>
    bool operator==(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const& rhs);
```

37       *Returns:* lhs.compare(typename sub\_match<BiIter>::string\_type(1, rhs)) == 0.

```
template <class BiIter>
    bool operator!=(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const& rhs);
```

38       *Returns:* !(lhs == rhs).

```
template <class BiIter>
    bool operator<(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const& rhs);
```

39       *Returns:* lhs.compare(typename sub\_match<BiIter>::string\_type(1, rhs)) < 0.

```
template <class BiIter>
    bool operator>(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const& rhs);
```

40       *Returns:* rhs < lhs.

```
template <class BiIter>
    bool operator>=(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const& rhs);
```

41       *Returns:* !(lhs < rhs).

```
template <class BiIter>
    bool operator<=(const sub_match<BiIter>& lhs,
                    typename iterator_traits<BiIter>::value_type const& rhs);
```

42       *Returns:* !(rhs < lhs).

```
template <class charT, class ST, class BiIter>
    basic_ostream<charT, ST>&
    operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
```

43       *Returns:* (os << m.str()).

## 28.10 Class template `match_results` [re.results]

- <sup>1</sup> Class template `match_results` denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.
- <sup>2</sup> The class template `match_results` satisfies the requirements of an allocator-aware container and of a sequence container, as specified in 23.2.1 and 23.2.3 respectively, except that only operations defined for const-qualified sequence containers are supported.
- <sup>3</sup> A default-constructed `match_results` object has no fully established result state. A match result is *ready* when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.
- <sup>4</sup> The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched. [*Note: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — end note*]

```
namespace std {
    template <class BidirectionalIterator,
              class Allocator = allocator<sub_match<BidirectionalIterator>>>
    class match_results {
    public:
        typedef sub_match<BidirectionalIterator>          value_type;
        typedef const value_type&                          const_reference;
        typedef value_type&                                reference;
        typedef implementation-defined                  const_iterator;
        typedef const_iterator                             iterator;
        typedef typename iterator_traits<BidirectionalIterator>::difference_type difference_type;
        typedef typename allocator_traits<Allocator>::size_type size_type;
        typedef Allocator                                  allocator_type;
        typedef typename iterator_traits<BidirectionalIterator>::
            value_type                                     char_type;
        typedef basic_string<char_type>                   string_type;

        // 28.10.1, construct/copy/destroy:
        explicit match_results(const Allocator& a = Allocator());
        match_results(const match_results& m);
        match_results(match_results&& m) noexcept;
        match_results& operator=(const match_results& m);

       regex_constants::format_default) const;
string_type
format(const char_type* fmt,
       regex_constants::match_flag_type flags =
       regex_constants::format_default) const;

// 28.10.6, allocator:
allocator_type get_allocator() const;

// 28.10.7, swap:
void swap(match_results& that);
};
}

```

## 28.10.1 match\_results constructors

[re.results.const]

- <sup>1</sup> In all `match_results` constructors, a copy of the `Allocator` argument shall be used for any memory allocation performed by the constructor or member functions during the lifetime of the object.

```
match_results(const Allocator& a = Allocator());
```

- <sup>2</sup> *Effects:* Constructs an object of class `match_results`.
- <sup>3</sup> *Postconditions:* `ready()` returns `false`. `size()` returns 0.

```
match_results(const match_results& m);
```

4 *Effects:* Constructs an object of class `match_results`, as a copy of `m`.

```
match_results(match_results&& m) noexcept;
```

5 *Effects:* Move constructs an object of class `match_results` from `m` satisfying the same postconditions as Table 159. Additionally, the stored `Allocator` value is move constructed from `m.get_allocator()`.

6 *Throws:* Nothing.

```
match_results& operator=(const match_results& m);
```

7 *Effects:* Assigns `m` to `*this`. The postconditions of this function are indicated in Table 159.

```
match_results& operator=(match_results&& m);
```

8 *Effects:* Move-assigns `m` to `*this`. The postconditions of this function are indicated in Table 159.

Table 159 — `match_results` assignment operator effects

| Element                  | Value                                                                    |
|--------------------------|--------------------------------------------------------------------------|
| <code>ready()</code>     | <code>m.ready()</code>                                                   |
| <code>size()</code>      | <code>m.size()</code>                                                    |
| <code>str(n)</code>      | <code>m.str(n)</code> for all integers <code>n &lt; m.size()</code>      |
| <code>prefix()</code>    | <code>m.prefix()</code>                                                  |
| <code>suffix()</code>    | <code>m.suffix()</code>                                                  |
| <code>(*this)[n]</code>  | <code>m[n]</code> for all integers <code>n &lt; m.size()</code>          |
| <code>length(n)</code>   | <code>m.length(n)</code> for all integers <code>n &lt; m.size()</code>   |
| <code>position(n)</code> | <code>m.position(n)</code> for all integers <code>n &lt; m.size()</code> |

### 28.10.2 `match_results` state

[re.results.state]

```
bool ready() const;
```

1 *Returns:* `true` if `*this` has a fully established result state, otherwise `false`.

### 28.10.3 `match_results` size

[re.results.size]

```
size_type size() const;
```

1 *Returns:* One plus the number of marked sub-expressions in the regular expression that was matched if `*this` represents the result of a successful match. Otherwise returns 0. [Note: The state of a `match_results` object can be modified only by passing that object to `regex_match` or `regex_search`. Sections 28.11.2 and 28.11.3 specify the effects of those algorithms on their `match_results` arguments. — end note]

```
size_type max_size() const;
```

2 *Returns:* The maximum number of `sub_match` elements that can be stored in `*this`.

```
bool empty() const;
```

3 *Returns:* `size() == 0`.

**28.10.4 match\_results element access****[re.results.acc]**

```
difference_type length(size_type sub = 0) const;
```

1     *Requires:* ready() == true.

2     *Returns:* (\*this)[sub].length().

```
difference_type position(size_type sub = 0) const;
```

3     *Requires:* ready() == true.

4     *Returns:* The distance from the start of the target sequence to (\*this)[sub].first.

```
string_type str(size_type sub = 0) const;
```

5     *Requires:* ready() == true.

6     *Returns:* string\_type((\*this)[sub]).

```
const_reference operator[](size_type n) const;
```

7     *Requires:* ready() == true.

8     *Returns:* A reference to the `sub_match` object representing the character sequence that matched marked sub-expression `n`. If `n == 0` then returns a reference to a `sub_match` object representing the character sequence that matched the whole regular expression. If `n >= size()` then returns a `sub_match` object representing an unmatched sub-expression.

```
const_reference prefix() const;
```

9     *Requires:* ready() == true.

10    *Returns:* A reference to the `sub_match` object representing the character sequence from the start of the string being matched/searched to the start of the match found.

```
const_reference suffix() const;
```

11    *Requires:* ready() == true.

12    *Returns:* A reference to the `sub_match` object representing the character sequence from the end of the match found to the end of the string being matched/searched.

```
const_iterator begin() const;
```

```
const_iterator cbegin() const;
```

13    *Returns:* A starting iterator that enumerates over all the sub-expressions stored in `*this`.

```
const_iterator end() const;
```

```
const_iterator cend() const;
```

14    *Returns:* A terminating iterator that enumerates over all the sub-expressions stored in `*this`.

**28.10.5 match\_results formatting****[re.results.form]**

```
template <class OutputIter>
```

```
OutputIter format(OutputIter out,
```

```
                  const char_type* fmt_first, const char_type* fmt_last,
```

```
                  regex_constants::match_flag_type flags =
```

```
                  regex_constants::format_default) const;
```

1 *Requires:* `ready() == true` and `OutputIter` shall satisfy the requirements for an Output Iterator (24.2.4).

2 *Effects:* Copies the character sequence `[fmt_first, fmt_last)` to `OutputIter out`. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within `*this` to which it refers. The bitmasks specified in `flags` determine which format specifiers and escape sequences are recognized.

3 *Returns:* `out`.

```
template <class OutputIter, class ST, class SA>
    OutputIter format(OutputIter out,
                      const basic_string<char_type, ST, SA>& fmt,
                      regex_constants::match_flag_type flags =
                        regex_constants::format_default) const;
```

4 *Effects:* Equivalent to:

```
    return format(out, fmt.data(), fmt.data() + fmt.size(), flags);
```

```
template <class ST, class SA>
    basic_string<char_type, ST, SA>
    format(const basic_string<char_type, ST, SA>& fmt,
           regex_constants::match_flag_type flags =
             regex_constants::format_default) const;
```

5 *Requires:* `ready() == true`.

6 *Effects:* Constructs an empty string `result` of type `basic_string<char_type, ST, SA>` and calls:

```
    format(back_inserter(result), fmt, flags);
```

7 *Returns:* `result`.

```
string_type
    format(const char_type* fmt,
           regex_constants::match_flag_type flags =
             regex_constants::format_default) const;
```

8 *Requires:* `ready() == true`.

9 *Effects:* Constructs an empty string `result` of type `string_type` and calls:

```
    format(back_inserter(result),
           fmt, fmt + char_traits<char_type>::length(fmt), flags);
```

10 *Returns:* `result`.

## 28.10.6 match\_results allocator

[re.results.all]

```
allocator_type get_allocator() const;
```

1 *Returns:* A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

**28.10.7 match\_results swap****[re.results.swap]**

```
void swap(match_results& that);
```

1 *Effects:* Swaps the contents of the two sequences.

2 *Postcondition:* *\*this* contains the sequence of matched sub-expressions that were in *that*, *that* contains the sequence of matched sub-expressions that were in *\*this*.

3 *Complexity:* Constant time.

```
template <class BidirectionalIterator, class Allocator>
    void swap(match_results<BidirectionalIterator, Allocator>& m1,
              match_results<BidirectionalIterator, Allocator>& m2);
```

4 *Effects:* As if by *m1.swap(m2)*.

**28.10.8 match\_results non-member functions****[re.results.nonmember]**

```
template <class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
               const match_results<BidirectionalIterator, Allocator>& m2);
```

1 *Returns:* *true* if neither match result is ready, *false* if one match result is ready and the other is not. If both match results are ready, returns *true* only if:

- (1.1) — *m1.empty()* && *m2.empty()*, or
- (1.2) — *!m1.empty()* && *!m2.empty()*, and the following conditions are satisfied:
  - (1.2.1) — *m1.prefix() == m2.prefix()*,
  - (1.2.2) — *m1.size() == m2.size()* && *equal(m1.begin(), m1.end(), m2.begin())*, and
  - (1.2.3) — *m1.suffix() == m2.suffix()*.

[ *Note:* The algorithm *equal* is defined in Clause 25. — *end note* ]

```
template <class BidirectionalIterator, class Allocator>
bool operator!=(const match_results<BidirectionalIterator, Allocator>& m1,
               const match_results<BidirectionalIterator, Allocator>& m2);
```

2 *Returns:* *!(m1 == m2)*.

**28.11 Regular expression algorithms****[re.alg]****28.11.1 exceptions****[re.except]**

1 The algorithms described in this subclause may throw an exception of type *regex\_error*. If such an exception *e* is thrown, *e.code()* shall return either *regex\_constants::error\_complexity* or *regex\_constants::error\_stack*.

**28.11.2 regex\_match****[re.alg.match]**

```
template <class BidirectionalIterator, class Allocator, class charT, class traits>
    bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                    match_results<BidirectionalIterator, Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags =
                        regex_constants::match_default);
```

1 *Requires:* The type *BidirectionalIterator* shall satisfy the requirements of a Bidirectional Iterator (24.2.6).

2 *Effects:* Determines whether there is a match between the regular expression *e*, and all of the character sequence [*first*, *last*). The parameter *flags* is used to control how the expression is matched

against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns **true** if such a match exists, **false** otherwise. [ *Example*:

```
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re);           // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re);           // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re);          // returns true, and m[0] contains "Get"
regex_match ("GetValues", m, re);          // returns false
```

— *end example*]

- 3 *Postconditions*: `m.ready() == true` in all cases. If the function returns **false**, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns **true**. Otherwise the effects on parameter `m` are given in Table 160.

Table 160 — Effects of `regex_match` algorithm

| Element                         | Value                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>m.size()</code>           | <code>1 + e.mark_count()</code>                                                                                                                                                                                   |
| <code>m.empty()</code>          | <b>false</b>                                                                                                                                                                                                      |
| <code>m.prefix().first</code>   | <b>first</b>                                                                                                                                                                                                      |
| <code>m.prefix().second</code>  | <b>first</b>                                                                                                                                                                                                      |
| <code>m.prefix().matched</code> | <b>false</b>                                                                                                                                                                                                      |
| <code>m.suffix().first</code>   | <b>last</b>                                                                                                                                                                                                       |
| <code>m.suffix().second</code>  | <b>last</b>                                                                                                                                                                                                       |
| <code>m.suffix().matched</code> | <b>false</b>                                                                                                                                                                                                      |
| <code>m[0].first</code>         | <b>first</b>                                                                                                                                                                                                      |
| <code>m[0].second</code>        | <b>last</b>                                                                                                                                                                                                       |
| <code>m[0].matched</code>       | <b>true</b>                                                                                                                                                                                                       |
| <code>m[n].first</code>         | For all integers $0 < n < m.size()$ , the start of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <b>last</b> . |
| <code>m[n].second</code>        | For all integers $0 < n < m.size()$ , the end of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <b>last</b> .   |
| <code>m[n].matched</code>       | For all integers $0 < n < m.size()$ , <b>true</b> if sub-expression <code>n</code> participated in the match, <b>false</b> otherwise.                                                                             |

```
template <class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
    const basic_regex<charT, traits>& e,
    regex_constants::match_flag_type flags =
        regex_constants::match_default);
```

- 4 *Effects*: Behaves “as if” by constructing an instance of `match_results<BidirectionalIterator>` `what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```
template <class charT, class Allocator, class traits>
```

```

bool regex_match(const charT* str,
                 match_results<const charT*, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags =
                 regex_constants::match_default);

```

5     *Returns:* `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```

template <class ST, class SA, class Allocator, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
                 match_results<
                 typename basic_string<charT, ST, SA>::const_iterator,
                 Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags =
                 regex_constants::match_default);

```

6     *Returns:* `regex_match(s.begin(), s.end(), m, e, flags)`.

```

template <class charT, class traits>
bool regex_match(const charT* str,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags =
                 regex_constants::match_default);

```

7     *Returns:* `regex_match(str, str + char_traits<charT>::length(str), e, flags)`

```

template <class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags =
                 regex_constants::match_default);

```

8     *Returns:* `regex_match(s.begin(), s.end(), e, flags)`.

### 28.11.3 regex\_search

[re.alg.search]

```

template <class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                 match_results<BidirectionalIterator, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags =
                 regex_constants::match_default);

```

1     *Requires:* Type `BidirectionalIterator` shall satisfy the requirements of a Bidirectional Iterator (24.2.6).

2     *Effects:* Determines whether there is some sub-sequence within `[first, last)` that matches the regular expression `e`. The parameter `flags` is used to control how the expression is matched against the character sequence. Returns `true` if such a sequence exists, `false` otherwise.

3     *Postconditions:* `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 161.

Table 161 — Effects of `regex_search` algorithm

| Element                         | Value                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>m.size()</code>           | <code>1 + e.mark_count()</code>                                                                                                                                                                                                          |
| <code>m.empty()</code>          | <code>false</code>                                                                                                                                                                                                                       |
| <code>m.prefix().first</code>   | <code>first</code>                                                                                                                                                                                                                       |
| <code>m.prefix().second</code>  | <code>m[0].first</code>                                                                                                                                                                                                                  |
| <code>m.prefix().matched</code> | <code>m.prefix().first != m.prefix().second</code>                                                                                                                                                                                       |
| <code>m.suffix().first</code>   | <code>m[0].second</code>                                                                                                                                                                                                                 |
| <code>m.suffix().second</code>  | <code>last</code>                                                                                                                                                                                                                        |
| <code>m.suffix().matched</code> | <code>m.suffix().first != m.suffix().second</code>                                                                                                                                                                                       |
| <code>m[0].first</code>         | The start of the sequence of characters that matched the regular expression                                                                                                                                                              |
| <code>m[0].second</code>        | The end of the sequence of characters that matched the regular expression                                                                                                                                                                |
| <code>m[0].matched</code>       | <code>true</code>                                                                                                                                                                                                                        |
| <code>m[n].first</code>         | For all integers <code>0 &lt; n &lt; m.size()</code> , the start of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <code>last</code> . |
| <code>m[n].second</code>        | For all integers <code>0 &lt; n &lt; m.size()</code> , the end of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <code>last</code> .   |
| <code>m[n].matched</code>       | For all integers <code>0 &lt; n &lt; m.size()</code> , <code>true</code> if sub-expression <code>n</code> participated in the match, <code>false</code> otherwise.                                                                       |

```

template <class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags =
                    regex_constants::match_default);

```

<sup>4</sup> *Returns:* The result of `regex_search(str, str + char_traits<charT>::length(str), m, e, flags)`.

```

template <class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
                  match_results<
                    typename basic_string<charT, ST, SA>::const_iterator,
                    Allocator>& m,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags =
                    regex_constants::match_default);

```

<sup>5</sup> *Returns:* The result of `regex_search(s.begin(), s.end(), m, e, flags)`.

```

template <class BidirectionalIterator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  regex_constants::match_flag_type flags =
                    regex_constants::match_default);

```

- 6 *Effects:* Behaves “as if” by constructing an object what of type `match_results<BidirectionalIterator>`, and then returning the result of `regex_search(first, last, what, e, flags)`.

```
template <class charT, class traits>
    bool regex_search(const charT* str,
                     const basic_regex<charT, traits>& e,
                     regex_constants::match_flag_type flags =
                     regex_constants::match_default);
```

- 7 *Returns:* `regex_search(str, str + char_traits<charT>::length(str), e, flags)`.

```
template <class ST, class SA, class charT, class traits>
    bool regex_search(const basic_string<charT, ST, SA>& s,
                     const basic_regex<charT, traits>& e,
                     regex_constants::match_flag_type flags =
                     regex_constants::match_default);
```

- 8 *Returns:* `regex_search(s.begin(), s.end(), e, flags)`.

#### 28.11.4 regex\_replace

[re.alg.replace]

```
template <class OutputIterator, class BidirectionalIterator,
         class traits, class charT, class ST, class SA>
    OutputIterator
    regex_replace(OutputIterator out,
                  BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, ST, SA>& fmt,
                  regex_constants::match_flag_type flags =
                  regex_constants::match_default);
```

```
template <class OutputIterator, class BidirectionalIterator,
         class traits, class charT>
    OutputIterator
    regex_replace(OutputIterator out,
                  BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags =
                  regex_constants::match_default);
```

- 1 *Effects:* Constructs a `regex_iterator` object `i` as if by

```
    regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)
```

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence `[first, last)`. If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```
    out = std::copy(first, last, out)
```

If any matches are found then, for each such match:

- (1.1) — If `!(flags & regex_constants::format_no_copy)`, calls
 

```
                out = std::copy(m.prefix().first, m.prefix().second, out)
```
- (1.2) — Then calls
 

```
                out = m.format(out, fmt, flags)
```

for the first form of the function and

```
out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
```

for the second.

Finally, if such a match is found and `!(flags & regex_constants::format_no_copy)`, calls

```
out = std::copy(last_m.suffix().first, last_m.suffix().second, out)
```

where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is non-zero, then only the first match found is replaced.

2 *Returns:* `out`.

```
template <class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s,
              const basic_regex<charT, traits>& e,
              const basic_string<charT, FST, FSA>& fmt,
              regex_constants::match_flag_type flags =
                regex_constants::match_default);
template <class traits, class charT, class ST, class SA>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s,
              const basic_regex<charT, traits>& e,
              const charT* fmt,
              regex_constants::match_flag_type flags =
                regex_constants::match_default);
```

3 *Effects:* Constructs an empty string result of type `basic_string<charT, ST, SA>` and calls:

```
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

4 *Returns:* `result`.

```
template <class traits, class charT, class ST, class SA>
basic_string<charT>
regex_replace(const charT* s,
              const basic_regex<charT, traits>& e,
              const basic_string<charT, ST, SA>& fmt,
              regex_constants::match_flag_type flags =
                regex_constants::match_default);
template <class traits, class charT>
basic_string<charT>
regex_replace(const charT* s,
              const basic_regex<charT, traits>& e,
              const charT* fmt,
              regex_constants::match_flag_type flags =
                regex_constants::match_default);
```

5 *Effects:* Constructs an empty string result of type `basic_string<charT>` and calls:

```
regex_replace(back_inserter(result),
              s, s + char_traits<charT>::length(s), e, fmt, flags);
```

6 *Returns:* `result`.

## 28.12 Regular expression iterators

[re.iter]

### 28.12.1 Class template `regex_iterator`

[re.regiter]

- <sup>1</sup> The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
    template <class BidirectionalIterator,
              class charT = typename iterator_traits<
                  BidirectionalIterator>::value_type,
              class traits = regex_traits<charT> >
    class regex_iterator {
    public:
        typedef basic_regex<charT, traits>          regex_type;
        typedef match_results<BidirectionalIterator> value_type;
        typedef std::ptrdiff_t                      difference_type;
        typedef const value_type*                   pointer;
        typedef const value_type&                   reference;
        typedef std::forward_iterator_tag           iterator_category;

        regex_iterator();
        regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                      const regex_type& re,
                      regex_constants::match_flag_type m =
                          regex_constants::match_default);
        regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                      const regex_type&& re,
                      regex_constants::match_flag_type m =
                          regex_constants::match_default) = delete;
        regex_iterator(const regex_iterator&);
        regex_iterator& operator=(const regex_iterator&);
        bool operator==(const regex_iterator&) const;
        bool operator!=(const regex_iterator&) const;
        const value_type& operator*() const;
        const value_type* operator->() const;
        regex_iterator& operator++();
        regex_iterator operator++(int);
    private:
        BidirectionalIterator          begin;    // exposition only
        BidirectionalIterator          end;      // exposition only
        const regex_type*              pregex;   // exposition only
        regex_constants::match_flag_type flags;  // exposition only
        match_results<BidirectionalIterator> match; // exposition only
    };
};
```

}

- <sup>2</sup> An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`. [Note: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as `'^'`, `'$'`, `'\b'`, `'\B'`). — end note]

#### 28.12.1.1 `regex_iterator` constructors

[re.regiter.cnstr]

`regex_iterator();`

- <sup>1</sup> *Effects:* Constructs an end-of-sequence iterator.

`regex_iterator(BidirectionalIterator a, BidirectionalIterator b,  
                  const regex_type& re,  
                  regex_constants::match_flag_type m = regex_constants::match_default);`

- <sup>2</sup> *Effects:* Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `&re`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

#### 28.12.1.2 `regex_iterator` comparisons

[re.regiter.comp]

`bool operator==(const regex_iterator& right) const;`

- <sup>1</sup> *Returns:* true if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

- (1.1) — `begin == right.begin`,
- (1.2) — `end == right.end`,
- (1.3) — `pregex == right.pregex`,
- (1.4) — `flags == right.flags`, and
- (1.5) — `match[0] == right.match[0]`;

otherwise false.

`bool operator!=(const regex_iterator& right) const;`

- <sup>2</sup> *Returns:* `!(*this == right)`.

#### 28.12.1.3 `regex_iterator` indirection

[re.regiter.deref]

`const value_type& operator*() const;`

- <sup>1</sup> *Returns:* `match`.

`const value_type* operator->() const;`

- <sup>2</sup> *Returns:* `&match`.

#### 28.12.1.4 `regex_iterator` increment

[re.regiter.incr]

`regex_iterator& operator++();`

- <sup>1</sup> *Effects:* Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.
- <sup>2</sup> If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.

- 3 Otherwise, if the iterator holds a zero-length match the operator calls `regex_search(start, end, match, *pregex, flags | regex_constants::match_not_null | regex_constants::match_continuous)`. If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.
- 4 If the most recent match was not a zero-length match, the operator sets `flags` to `flags | regex_constants::match_prev_avail` and calls `regex_search(start, end, match, *pregex, flags)`. If the call returns `false` the iterator sets `*this` to the end-of-sequence iterator. The iterator then returns `*this`.
- 5 In all cases in which the call to `regex_search` returns `true`, `match.prefix().first` shall be equal to the previous value of `match[0].second`, and for each index `i` in the half-open range `[0, match.size())` for which `match[i].matched` is true, `match.position(i)` shall return `distance(begin, match[i].first)`.
- 6 [ *Note*: This means that `match.position(i)` gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to `regex_search`. — *end note* ]
- 7 It is unspecified how the implementation makes these adjustments.
- 8 [ *Note*: This means that a compiler may call an implementation-specific search function, in which case a user-defined specialization of `regex_search` will not be called. — *end note* ]

```
regex_iterator operator++(int);
```

- 9 *Effects*: As if by:

```
    regex_iterator tmp = *this;
    ++(*this);
    return tmp;
```

## 28.12.2 Class template `regex_token_iterator`

[`re.tokiter`]

- 1 The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a `sub_match` class template instance that represents what matched a particular sub-expression within the regular expression.
- 2 When class `regex_token_iterator` is used to enumerate a single sub-expression with index -1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.
- 3 After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator> position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if `N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets count `N` to zero.
- 4 If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index -1, in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.
- 5 The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of

operator-> on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>*` is returned.

- <sup>6</sup> It is impossible to store things into `regex_token_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
    template <class BidirectionalIterator,
              class charT = typename iterator_traits<
                  BidirectionalIterator>::value_type,
              class traits = regex_traits<charT> >
    class regex_token_iterator {
    public:
        typedef basic_regex<charT, traits>          regex_type;
        typedef sub_match<BidirectionalIterator>    value_type;
        typedef std::ptrdiff_t                      difference_type;
        typedef const value_type*                  pointer;
        typedef const value_type&                  reference;
        typedef std::forward_iterator_tag          iterator_category;

        regex_token_iterator();
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           int submatch = 0,
                           regex_constants::match_flag_type m =
                               regex_constants::match_default);
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           const std::vector<int>& submatches,
                           regex_constants::match_flag_type m =
                               regex_constants::match_default);
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           initializer_list<int> submatches,
                           regex_constants::match_flag_type m =
                               regex_constants::match_default);
    template <std::size_t N>
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           const int (&submatches)[N],
                           regex_constants::match_flag_type m =
                               regex_constants::match_default);
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type&& re,
                           int submatch = 0,
                           regex_constants::match_flag_type m =
                               regex_constants::match_default) = delete;
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type&& re,
                           const std::vector<int>& submatches,
                           regex_constants::match_flag_type m =
                               regex_constants::match_default) = delete;
        regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type&& re,
                           initializer_list<int> submatches,
```

```

        regex_constants::match_flag_type m =
            regex_constants::match_default) = delete;
template <std::size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                    const regex_type&& re,
                    const int (&submatches)[N],
                    regex_constants::match_flag_type m =
                        regex_constants::match_default) = delete;
regex_token_iterator(const regex_token_iterator&);
regex_token_iterator& operator=(const regex_token_iterator&);
bool operator==(const regex_token_iterator&) const;
bool operator!=(const regex_token_iterator&) const;
const value_type& operator*() const;
const value_type* operator->() const;
regex_token_iterator& operator++();
regex_token_iterator operator++(int);
private:
    typedef
        regex_iterator<BidirectionalIterator, charT, traits> position_iterator; // exposition only
    position_iterator position; // exposition only
    const value_type* result; // exposition only
    value_type suffix; // exposition only
    std::size_t N; // exposition only
    std::vector<int> subs; // exposition only
};
}

```

- <sup>7</sup> A *suffix iterator* is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is `true`, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.
- <sup>8</sup> [ *Note:* For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence — *end note* ]
- <sup>9</sup> The *current match* is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

### 28.12.2.1 `regex_token_iterator` constructors

[re.tokiter.cnstr]

```
regex_token_iterator();
```

- <sup>1</sup> *Effects:* Constructs the end-of-sequence iterator.

```

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                    const regex_type& re,
                    int submatch = 0,
                    regex_constants::match_flag_type m =
                        regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                    const regex_type& re,
                    const std::vector<int>& submatches,
                    regex_constants::match_flag_type m =
                        regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,

```

```

const regex_type& re,
initializer_list<int> submatches,
regex_constants::match_flag_type m =
    regex_constants::match_default);

```

```

template <std::size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    const int (&submatches)[N],
    regex_constants::match_flag_type m =
        regex_constants::match_default);

```

- 2 *Requires:* Each of the initialization values of `submatches` shall be  $\geq -1$ .
- 3 *Effects:* The first constructor initializes the member `subs` to hold the single value `submatch`. The second constructor initializes the member `subs` to hold a copy of the argument `submatches`. The third and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[submatches.begin(), submatches.end())` and `[&submatches, &submatches + N)`, respectively.
- 4 Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to -1 the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

#### 28.12.2.2 `regex_token_iterator` comparisons

[re.tokiter.comp]

```
bool operator==(const regex_token_iterator& right) const;
```

- 1 *Returns:* true if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns false if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns false.

```
bool operator!=(const regex_token_iterator& right) const;
```

- 2 *Returns:* `!(*this == right)`.

#### 28.12.2.3 `regex_token_iterator` indirection

[re.tokiter.deref]

```
const value_type& operator*() const;
```

- 1 *Returns:* `*result`.

```
const value_type* operator->() const;
```

- 2 *Returns:* `result`.

#### 28.12.2.4 `regex_token_iterator` increment

[re.tokiter.incr]

```
regex_token_iterator& operator++();
```

- 1 *Effects:* Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.
- 2 If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.
- 3 Otherwise, if `N + 1 < subs.size()`, increments `N` and sets `result` to the address of the current match.
- 4 Otherwise, sets `N` to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.

5 Otherwise, if any of the values stored in `subs` is equal to -1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range `[prev->suffix().first, prev->suffix().second)`.

6 Otherwise, sets `*this` to an end-of-sequence iterator.

*Returns:* `*this`

```
regex_token_iterator& operator++(int);
```

7 *Effects:* Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

8 *Returns:* `tmp`.

### 28.13 Modified ECMAScript regular expression grammar [re.grammar]

1 The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

2 Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

3 The following productions within the ECMAScript grammar are modified as follows:

```
ClassAtom ::
-
    ClassAtomNoDash
    ClassAtomExClass
    ClassAtomCollatingElement
    ClassAtomEquivalence
```

4 The following new productions are then added:

```
ClassAtomExClass ::
    [: ClassName :]

ClassAtomCollatingElement ::
    [. ClassName .]

ClassAtomEquivalence ::
    [= ClassName =]

ClassName ::
    ClassNameCharacter
    ClassNameCharacter ClassName

ClassNameCharacter ::
    SourceCharacter but not one of "." "=" ":"
```

5 The productions `ClassAtomExClass`, `ClassAtomCollatingElement` and `ClassAtomEquivalence` provide functionality equivalent to that of the same features in regular expressions in POSIX.

6 The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in Table 155.

7 A `ClassName` production, when used in `ClassAtomExClass`, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid `ClassNames` are determined by the type of the

traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

`\d` and `[[:digit:]]`

`\D` and `[^[:digit:]]`

`\s` and `[[:space:]]`

`\S` and `[^[:space:]]`

`\w` and `[_[:alnum:]]`

`\W` and `[^_[:alnum:]]`

- <sup>8</sup> A `ClassName` production when used in a `ClassAtomCollatingElement` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.
- <sup>9</sup> The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR'ed together and subsequently passed to `traits_inst.isctype`.
- <sup>10</sup> A `ClassName` production when used in a `ClassAtomEquivalence` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.
- <sup>11</sup> When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.
- <sup>12</sup> If the *CV* of a *UnicodeEscapeSequence* is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`. [ *Note*: This means that values of the form "uxxxx" that do not fit in a character are invalid. — *end note* ]
- <sup>13</sup> Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.
- <sup>14</sup> The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags [28.5.2](#) specified when using the regular expression object in one of the regular expression algorithms [28.11](#). The behavior is also localized by interaction with the traits class template parameter as follows:
  - (14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:
    1. if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;
    2. otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;
    3. otherwise, the two characters are equal if `c == d`.
  - (14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is false then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:

```
string_type str1 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c1) : traits_inst.translate(c1);
```

```

string_type str2 = string_type(1,
    flags() & icaſe ?
        traits_inst.translate_nocase(c2) : traits_inst.translate(c2);
string_type str = string_type(1,
    flags() & icaſe ?
        traits_inst.translate_nocase(c) : traits_inst.translate(c);
return traits_inst.transform(str1.begin(), str1.end())
    <= traits_inst.transform(str.begin(), str.end())
    && traits_inst.transform(str.begin(), str.end())
    <= traits_inst.transform(str2.begin(), str2.end());

```

- (14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.
- (14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character `c` is a member of a character class designated by an iterator range `[first, last)` if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icaſe))` is true.

## 29 Atomic operations library [atomics]

### 29.1 General [atomics.general]

- <sup>1</sup> This Clause describes components for fine-grained atomic access. This access is provided via operations on atomic objects.
- <sup>2</sup> The following subclauses describe atomics requirements and components for types and operations, as summarized below.

Table 162 — Atomics library summary

| Subclause                                       | Header(s) |
|-------------------------------------------------|-----------|
| <a href="#">29.3</a> Order and Consistency      |           |
| <a href="#">29.4</a> Lock-free Property         |           |
| <a href="#">29.5</a> Atomic Types               | <atomic>  |
| <a href="#">29.6</a> Operations on Atomic Types |           |
| <a href="#">29.7</a> Flag Type and Operations   |           |
| <a href="#">29.8</a> Fences                     |           |

### 29.2 Header <atomic> synopsis [atomics.syn]

```

#define ATOMIC_FLAG_INIT see below

// 29.8, fences
extern "C" void atomic_thread_fence(memory_order) noexcept;
extern "C" void atomic_signal_fence(memory_order) noexcept;
}

```

### 29.3 Order and consistency

[atomics.order]

```

namespace std {
    typedef enum memory_order {
        memory_order_relaxed, memory_order_consume, memory_order_acquire,
        memory_order_release, memory_order_acq_rel, memory_order_seq_cst
    } memory_order;
}

```

<sup>1</sup> The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 1.10 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

- (1.1) — `memory_order_relaxed`: no operation orders memory.
- (1.2) — `memory_order_release`, `memory_order_acq_rel`, and `memory_order_seq_cst`: a store operation performs a release operation on the affected memory location.
- (1.3) — `memory_order_consume`: a load operation performs a consume operation on the affected memory location.
- (1.4) — `memory_order_acquire`, `memory_order_acq_rel`, and `memory_order_seq_cst`: a load operation performs an acquire operation on the affected memory location.

[*Note*: Atomic operations specifying `memory_order_relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — *end note*]

- <sup>2</sup> An atomic operation *A* that performs a release operation on an atomic object *M* synchronizes with an atomic operation *B* that performs an acquire operation on *M* and takes its value from any side effect in the release sequence headed by *A*.
- <sup>3</sup> There shall be a single total order *S* on all `memory_order_seq_cst` operations, consistent with the “happens before” order and modification orders for all affected locations, such that each `memory_order_seq_cst` operation *B* that loads a value from an atomic object *M* observes one of the following values:
- (3.1) — the result of the last modification *A* of *M* that precedes *B* in *S*, if it exists, or
  - (3.2) — if *A* exists, the result of some modification of *M* that is not `memory_order_seq_cst` and that does not happen before *A*, or
  - (3.3) — if *A* does not exist, the result of some modification of *M* that is not `memory_order_seq_cst`.
- [*Note:* Although it is not explicitly required that *S* include locks, it can always be extended to an order that does include lock and unlock operations, since the ordering between those is already included in the “happens before” ordering. — *end note*]
- <sup>4</sup> For an atomic operation *B* that reads the value of an atomic object *M*, if there is a `memory_order_seq_cst` fence *X* sequenced before *B*, then *B* observes either the last `memory_order_seq_cst` modification of *M* preceding *X* in the total order *S* or a later modification of *M* in its modification order.
- <sup>5</sup> For atomic operations *A* and *B* on an atomic object *M*, where *A* modifies *M* and *B* takes its value, if there is a `memory_order_seq_cst` fence *X* such that *A* is sequenced before *X* and *B* follows *X* in *S*, then *B* observes either the effects of *A* or a later modification of *M* in its modification order.
- <sup>6</sup> For atomic operations *A* and *B* on an atomic object *M*, where *A* modifies *M* and *B* takes its value, if there are `memory_order_seq_cst` fences *X* and *Y* such that *A* is sequenced before *X*, *Y* is sequenced before *B*, and *X* precedes *Y* in *S*, then *B* observes either the effects of *A* or a later modification of *M* in its modification order.
- <sup>7</sup> For atomic modifications *A* and *B* of an atomic object *M*, *B* occurs later than *A* in the modification order of *M* if:
- (7.1) — there is a `memory_order_seq_cst` fence *X* such that *A* is sequenced before *X*, and *X* precedes *B* in *S*,  
or
  - (7.2) — there is a `memory_order_seq_cst` fence *Y* such that *Y* is sequenced before *B*, and *A* precedes *Y* in *S*,  
or
  - (7.3) — there are `memory_order_seq_cst` fences *X* and *Y* such that *A* is sequenced before *X*, *Y* is sequenced before *B*, and *X* precedes *Y* in *S*.
- <sup>8</sup> [*Note:* `memory_order_seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order_seq_cst` operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In particular, `memory_order_seq_cst` fences ensure a total order only for the fences themselves. Fences cannot, in general, be used to restore sequential consistency for atomic operations with weaker ordering specifications. — *end note*]
- <sup>9</sup> Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[*Note:* For example, with *x* and *y* initially zero,

```
// Thread 1:
r1 = y.load(memory_order_relaxed);
x.store(r1, memory_order_relaxed);

// Thread 2:
r2 = x.load(memory_order_relaxed);
y.store(r2, memory_order_relaxed);
```

should not produce `r1 == r2 == 42`, since the store of 42 to `y` is only possible if the store to `x` stores 42, which circularly depends on the store to `y` storing 42. Note that without this restriction, such an execution is possible. — *end note*]

- 10 [ *Note*: The recommendation similarly disallows `r1 == r2 == 42` in the following example, with `x` and `y` again initially zero:

```
// Thread 1:
r1 = x.load(memory_order_relaxed);
if (r1 == 42) y.store(42, memory_order_relaxed);

// Thread 2:
r2 = y.load(memory_order_relaxed);
if (r2 == 42) x.store(42, memory_order_relaxed);
```

— *end note*]

- 11 Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.
- 12 Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```
template <class T>
T kill_dependency(T y) noexcept;
```

- 13 *Effects*: The argument does not carry a dependency to the return value (1.10).

- 14 *Returns*: `y`.

## 29.4 Lock-free property

[`atomics.lockfree`]

```
#define ATOMIC_BOOL_LOCK_FREE unspecified
#define ATOMIC_CHAR_LOCK_FREE unspecified
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified
#define ATOMIC_SHORT_LOCK_FREE unspecified
#define ATOMIC_INT_LOCK_FREE unspecified
#define ATOMIC_LONG_LOCK_FREE unspecified
#define ATOMIC_LLONG_LOCK_FREE unspecified
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

- 1 The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.
- 2 The function `atomic_is_lock_free` (29.6) indicates whether the object is lock-free. In any given program execution, the result of the lock-free query shall be consistent for all pointers of the same type.
- 3 [ *Note*: Operations that are lock-free should also be address-free. That is, atomic operations on the same memory location via two different addresses will communicate atomically. The implementation should not depend on any per-process state. This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — *end note*]

## 29.5 Atomic types

[`atomics.types.generic`]

```
namespace std {
    template <class T> struct atomic {
        bool is_lock_free() const volatile noexcept;
```

```

bool is_lock_free() const noexcept;

```

- <sup>1</sup> There is a generic class template `atomic<T>`. The type of the template argument `T` shall be trivially copyable (3.9). [ *Note*: Type arguments that are not also statically initializable may be difficult to use. — *end note* ]
- <sup>2</sup> The semantics of the operations on specializations of `atomic` are defined in 29.6.
- <sup>3</sup> Specializations and instantiations of the `atomic` template shall have a deleted copy constructor, a deleted copy assignment operator, and a constexpr value constructor.
- <sup>4</sup> There shall be explicit specializations of the `atomic` template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>`. For each integral type *integral*, the specialization `atomic<integral>` provides additional atomic operations appropriate to integral types. There shall be a specialization `atomic<bool>` which provides the general atomic operations as specified in 29.6.1.
- <sup>5</sup> The atomic integral specializations and the specialization `atomic<bool>` shall have standard layout. They shall each have a trivial default constructor and a trivial destructor. They shall each support aggregate initialization syntax.
- <sup>6</sup> There shall be pointer partial specializations of the `atomic` class template. These specializations shall have standard layout, trivial default constructors, and trivial destructors. They shall each support aggregate initialization syntax.
- <sup>7</sup> There shall be named types corresponding to the integral specializations of `atomic`, as specified in Table 163, and a named type `atomic_bool` corresponding to the specified `atomic<bool>`. Each named type is either a typedef to the corresponding specialization or a base class of the corresponding specialization. If it is a base class, it shall support the same member functions as the corresponding specialization.
- <sup>8</sup> There shall be atomic typedefs corresponding to non-atomic typedefs as specified in Table 164.
- <sup>9</sup> [ *Note*: The representation of an atomic specialization need not have the same size as its corresponding argument type. Specializations should have the same size whenever possible, as this reduces the effort required

Table 163 — Named atomic types

| Named atomic type            | Corresponding non-atomic type   |
|------------------------------|---------------------------------|
| <code>atomic_char</code>     | <code>char</code>               |
| <code>atomic_schar</code>    | <code>signed char</code>        |
| <code>atomic_uchar</code>    | <code>unsigned char</code>      |
| <code>atomic_short</code>    | <code>short</code>              |
| <code>atomic_ushort</code>   | <code>unsigned short</code>     |
| <code>atomic_int</code>      | <code>int</code>                |
| <code>atomic_uint</code>     | <code>unsigned int</code>       |
| <code>atomic_long</code>     | <code>long</code>               |
| <code>atomic_ulong</code>    | <code>unsigned long</code>      |
| <code>atomic_llong</code>    | <code>long long</code>          |
| <code>atomic_ullong</code>   | <code>unsigned long long</code> |
| <code>atomic_char16_t</code> | <code>char16_t</code>           |
| <code>atomic_char32_t</code> | <code>char32_t</code>           |
| <code>atomic_wchar_t</code>  | <code>wchar_t</code>            |

to port existing code. — *end note*]

## 29.6 Operations on atomic types [atomics.types.operations]

### 29.6.1 General operations on atomic types [atomics.types.operations.general]

- <sup>1</sup> The implementation shall provide the functions and function templates identified as “general operations on atomic types” in 29.2.
- <sup>2</sup> In the declarations of these functions and function templates, the name *atomic-type* refers to either `atomic<T>` or to a named base class for *T* from Table 163 or inferred from Table 164.

### 29.6.2 Templated operations on atomic types [atomics.types.operations.templ]

- <sup>1</sup> The implementation shall declare but not define the function templates identified as “templated operations on atomic types” in 29.2.

### 29.6.3 Arithmetic operations on atomic types [atomics.types.operations.arith]

- <sup>1</sup> The implementation shall provide the functions and function template specializations identified as “arithmetic operations on atomic types” in 29.2.
- <sup>2</sup> In the declarations of these functions and function template specializations, the name *integral* refers to an integral type and the name *atomic-integral* refers to either `atomic<integral>` or to a named base class for *integral* from Table 163 or inferred from Table 164.

### 29.6.4 Operations on atomic pointer types [atomics.types.operations.pointer]

- <sup>1</sup> The implementation shall provide the function template specializations identified as “partial specializations for pointers” in 29.2.

### 29.6.5 Requirements for operations on atomic types [atomics.types.operations.req]

- <sup>1</sup> There are only a few kinds of operations on atomic types, though there are many instances on those kinds. This section specifies each general kind. The specific instances are defined in 29.5, 29.6.1, 29.6.3, and 29.6.4.
- <sup>2</sup> In the following operation definitions:
  - (2.1) — an *A* refers to one of the atomic types.
  - (2.2) — a *C* refers to its corresponding non-atomic type.

Table 164 — Atomic typedefs

| Atomic typedef        | Corresponding non-atomic typedef |
|-----------------------|----------------------------------|
| atomic_int_least8_t   | int_least8_t                     |
| atomic_uint_least8_t  | uint_least8_t                    |
| atomic_int_least16_t  | int_least16_t                    |
| atomic_uint_least16_t | uint_least16_t                   |
| atomic_int_least32_t  | int_least32_t                    |
| atomic_uint_least32_t | uint_least32_t                   |
| atomic_int_least64_t  | int_least64_t                    |
| atomic_uint_least64_t | uint_least64_t                   |
| atomic_int_fast8_t    | int_fast8_t                      |
| atomic_uint_fast8_t   | uint_fast8_t                     |
| atomic_int_fast16_t   | int_fast16_t                     |
| atomic_uint_fast16_t  | uint_fast16_t                    |
| atomic_int_fast32_t   | int_fast32_t                     |
| atomic_uint_fast32_t  | uint_fast32_t                    |
| atomic_int_fast64_t   | int_fast64_t                     |
| atomic_uint_fast64_t  | uint_fast64_t                    |
| atomic_intptr_t       | intptr_t                         |
| atomic_uintptr_t      | uintptr_t                        |
| atomic_size_t         | size_t                           |
| atomic_ptrdiff_t      | ptrdiff_t                        |
| atomic_intmax_t       | intmax_t                         |
| atomic_uintmax_t      | uintmax_t                        |

(2.3) — an *M* refers to type of the other argument for arithmetic operations. For integral atomic types, *M* is *C*. For atomic address types, *M* is `std::ptrdiff_t`.

(2.4) — the non-member functions not ending in `_explicit` have the semantics of their corresponding `_explicit` functions with `memory_order` arguments of `memory_order_seq_cst`.

<sup>3</sup> [ *Note*: Many operations are volatile-qualified. The “volatile as device register” semantics have not changed in the standard. This qualification means that volatility is preserved when applying these operations to volatile objects. It does not mean that operations on non-volatile objects become volatile. Thus, volatile qualified operations on non-volatile objects may be merged under some conditions. — *end note* ]

```
A::A() noexcept = default;
```

<sup>4</sup> *Effects*: Leaves the atomic object in an uninitialized state. [ *Note*: These semantics ensure compatibility with *C*. — *end note* ]

```
constexpr A::A(C desired) noexcept;
```

<sup>5</sup> *Effects*: Initializes the object with the value `desired`. Initialization is not an atomic operation (1.10). [ *Note*: it is possible to have an access to an atomic object *A* race with its construction, for example by communicating the address of the just-constructed object *A* to another thread via `memory_order_relaxed` operations on a suitable atomic pointer variable, and then immediately accessing *A* in the receiving thread. This results in undefined behavior. — *end note* ]

```
#define ATOMIC_VAR_INIT(value) see below
```

<sup>6</sup> The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with *value*. [ *Note*: This operation

may need to initialize locks. — *end note*] Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race. [ *Example:*

```
atomic<int> v = ATOMIC_VAR_INIT(5);
```

— *end example*]

```
static constexpr bool is_always_lock_free = implementation-defined;
```

- 7 The static data member `is_always_lock_free` is true if the atomic type's operations are always lock-free, and false otherwise. [ *Note:* The value of `is_always_lock_free` is consistent with the value of the corresponding `ATOMIC_..._LOCK_FREE` macro, if defined. — *end note*]

```
bool atomic_is_lock_free(const volatile A* object) noexcept;
bool atomic_is_lock_free(const A* object) noexcept;
bool A::is_lock_free() const volatile noexcept;
bool A::is_lock_free() const noexcept;
```

- 8 *Returns:* true if the object's operations are lock-free, false otherwise. [ *Note:* The return value of the `is_lock_free` member function is consistent with the value of `is_always_lock_free` for the same type. — *end note*]

```
void atomic_init(volatile A* object, C desired) noexcept;
void atomic_init(A* object, C desired) noexcept;
```

- 9 *Effects:* Non-atomically initializes `*object` with value `desired`. This function shall only be applied to objects that have been default constructed, and then only once. [ *Note:* These semantics ensure compatibility with C. — *end note*] [ *Note:* Concurrent access from another thread, even via an atomic operation, constitutes a data race. — *end note*]

```
void atomic_store(volatile A* object, C desired) noexcept;
void atomic_store(A* object, C desired) noexcept;
void atomic_store_explicit(volatile A* object, C desired, memory_order order) noexcept;
void atomic_store_explicit(A* object, C desired, memory_order order) noexcept;
void A::store(C desired, memory_order order = memory_order_seq_cst) volatile noexcept;
void A::store(C desired, memory_order order = memory_order_seq_cst) noexcept;
```

- 10 *Requires:* The `order` argument shall not be `memory_order_consume`, `memory_order_acquire`, nor `memory_order_acq_rel`.

- 11 *Effects:* Atomically replaces the value pointed to by `object` or by `this` with the value of `desired`. Memory is affected according to the value of `order`.

```
C A::operator=(C desired) volatile noexcept;
C A::operator=(C desired) noexcept;
```

- 12 *Effects:* As if by `store(desired)`.

- 13 *Returns:* `desired`.

```
C atomic_load(const volatile A* object) noexcept;
C atomic_load(const A* object) noexcept;
C atomic_load_explicit(const volatile A* object, memory_order) noexcept;
C atomic_load_explicit(const A* object, memory_order) noexcept;
C A::load(memory_order order = memory_order_seq_cst) const volatile noexcept;
C A::load(memory_order order = memory_order_seq_cst) const noexcept;
```

14 *Requires:* The `order` argument shall not be `memory_order_release` nor `memory_order_acq_rel`.

15 *Effects:* Memory is affected according to the value of `order`.

16 *Returns:* Atomically returns the value pointed to by `object` or by `this`.

```
A::operator C() const volatile noexcept;
```

```
A::operator C() const noexcept;
```

17 *Effects:* As if by `load()`.

18 *Returns:* The result of `load()`.

```
C atomic_exchange(volatile A* object, C desired) noexcept;
```

```
C atomic_exchange(A* object, C desired) noexcept;
```

```
C atomic_exchange_explicit(volatile A* object, C desired, memory_order) noexcept;
```

```
C atomic_exchange_explicit(A* object, C desired, memory_order) noexcept;
```

```
C A::exchange(C desired, memory_order order = memory_order_seq_cst) volatile noexcept;
```

```
C A::exchange(C desired, memory_order order = memory_order_seq_cst) noexcept;
```

19 *Effects:* Atomically replaces the value pointed to by `object` or by `this` with `desired`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (1.10).

20 *Returns:* Atomically returns the value pointed to by `object` or by `this` immediately before the effects.

```
bool atomic_compare_exchange_weak(volatile A* object, C* expected, C desired) noexcept;
```

```
bool atomic_compare_exchange_weak(A* object, C* expected, C desired) noexcept;
```

```
bool atomic_compare_exchange_strong(volatile A* object, C* expected, C desired) noexcept;
```

```
bool atomic_compare_exchange_strong(A* object, C* expected, C desired) noexcept;
```

```
bool atomic_compare_exchange_weak_explicit(volatile A* object, C* expected, C desired,
memory_order success, memory_order failure) noexcept;
```

```
bool atomic_compare_exchange_weak_explicit(A* object, C* expected, C desired,
memory_order success, memory_order failure) noexcept;
```

```
bool atomic_compare_exchange_strong_explicit(volatile A* object, C* expected, C desired,
memory_order success, memory_order failure) noexcept;
```

```
bool atomic_compare_exchange_strong_explicit(A* object, C* expected, C desired,
memory_order success, memory_order failure) noexcept;
```

```
bool A::compare_exchange_weak(C& expected, C desired,
memory_order success, memory_order failure) volatile noexcept;
```

```
bool A::compare_exchange_weak(C& expected, C desired,
memory_order success, memory_order failure) noexcept;
```

```
bool A::compare_exchange_strong(C& expected, C desired,
memory_order success, memory_order failure) volatile noexcept;
```

```
bool A::compare_exchange_strong(C& expected, C desired,
memory_order success, memory_order failure) noexcept;
```

```
bool A::compare_exchange_weak(C& expected, C desired,
memory_order order = memory_order_seq_cst) volatile noexcept;
```

```
bool A::compare_exchange_weak(C& expected, C desired,
memory_order order = memory_order_seq_cst) noexcept;
```

```
bool A::compare_exchange_strong(C& expected, C desired,
memory_order order = memory_order_seq_cst) volatile noexcept;
```

```
bool A::compare_exchange_strong(C& expected, C desired,
memory_order order = memory_order_seq_cst) noexcept;
```

21 *Requires:* The `failure` argument shall not be `memory_order_release` nor `memory_order_acq_rel`. The `failure` argument shall be no stronger than the `success` argument.

22 *Effects:* Atomically, compares the contents of the memory pointed to by `object` or by `this` for equality with that in `expected`, and if true, replaces the contents of the memory pointed to by `object` or

by **this** with that in **desired**, and if false, updates the contents of the memory in **expected** with the contents of the memory pointed to by **object** or by **this**. Further, if the comparison is true, memory is affected according to the value of **success**, and if the comparison is false, memory is affected according to the value of **failure**. When only one **memory\_order** argument is supplied, the value of **success** is **order**, and the value of **failure** is **order** except that a value of **memory\_order\_acq\_rel** shall be replaced by the value **memory\_order\_acquire** and a value of **memory\_order\_release** shall be replaced by the value **memory\_order\_relaxed**. If the operation returns **true**, these operations are atomic read-modify-write operations (1.10). Otherwise, these operations are atomic load operations.

23 *Returns:* The result of the comparison.

24 [ *Note:* For example, the effect of **atomic\_compare\_exchange\_strong** is

```
    if (memcmp(object, expected, sizeof(*object)) == 0)
        memcpy(object, &desired, sizeof(*object));
    else
        memcpy(expected, object, sizeof(*object));
```

— *end note*] [ *Example:* the expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update **expected** when another iteration of the loop is needed.

```
    expected = current.load();
    do {
        desired = function(expected);
    } while (!current.compare_exchange_weak(expected, desired));
```

— *end example*]

25 Implementations should ensure that weak compare-and-exchange operations do not consistently return **false** unless either the atomic object has value different from **expected** or there are concurrent modifications to the atomic object.

26 *Remark:* A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by **expected** and **object** are equal, it may return false and store back to **expected** the same memory contents that were originally there. [ *Note:* This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop.

When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — *end note*]

27 [ *Note:* The **memcpy** and **memcmp** semantics of the compare-and-exchange operations may result in failed comparisons for values that compare equal with **operator==** if the underlying type has padding bits, trap bits, or alternate representations of the same value. Thus, **compare\_exchange\_strong** should be used with extreme care. On the other hand, **compare\_exchange\_weak** should converge rapidly. — *end note*]

28 The following operations perform arithmetic computations. The key, operator, and computation correspondence is:

```
C atomic_fetch_key(volatile A* object, M operand) noexcept;
C atomic_fetch_key(A* object, M operand) noexcept;
C atomic_fetch_key_explicit(volatile A* object, M operand, memory_order order) noexcept;
C atomic_fetch_key_explicit(A* object, M operand, memory_order order) noexcept;
C A::fetch_key(M operand, memory_order order = memory_order_seq_cst) volatile noexcept;
C A::fetch_key(M operand, memory_order order = memory_order_seq_cst) noexcept;
```

Table 165 — Atomic arithmetic computations

| Key | Op | Computation          | Key | Op | Computation          |
|-----|----|----------------------|-----|----|----------------------|
| add | +  | addition             | sub | -  | subtraction          |
| or  |    | bitwise inclusive or | xor | ^  | bitwise exclusive or |
| and | &  | bitwise and          |     |    |                      |

29 *Effects:* Atomically replaces the value pointed to by **object** or by **this** with the result of the *computation* applied to the value pointed to by **object** or by **this** and the given **operand**. Memory is affected according to the value of **order**. These operations are atomic read-modify-write operations (1.10).

30 *Returns:* Atomically, the value pointed to by **object** or by **this** immediately before the effects.

31 *Remark:* For signed integer types, arithmetic is defined to use two's complement representation. There are no undefined results. For address types, the result may be an undefined address, but the operations otherwise have no undefined behavior.

*C A::operator op=(M operand) volatile noexcept;*

*C A::operator op=(M operand) noexcept;*

32 *Effects:* As if by `fetch_key(operand)`.

33 *Returns:* `fetch_key(operand) op operand`.

*C A::operator++(int) volatile noexcept;*

*C A::operator++(int) noexcept;*

34 *Returns:* `fetch_add(1)`.

*C A::operator--(int) volatile noexcept;*

*C A::operator--(int) noexcept;*

35 *Returns:* `fetch_sub(1)`.

*C A::operator++() volatile noexcept;*

*C A::operator++() noexcept;*

36 *Effects:* As if by `fetch_add(1)`.

37 *Returns:* `fetch_add(1) + 1`.

*C A::operator--() volatile noexcept;*

*C A::operator--() noexcept;*

38 *Effects:* As if by `fetch_sub(1)`.

39 *Returns:* `fetch_sub(1) - 1`.

## 29.7 Flag type and operations

[atomics.flag]

```
namespace std {
    typedef struct atomic_flag {
        bool test_and_set(memory_order = memory_order_seq_cst) volatile noexcept;
        bool test_and_set(memory_order = memory_order_seq_cst) noexcept;
        void clear(memory_order = memory_order_seq_cst) volatile noexcept;
        void clear(memory_order = memory_order_seq_cst) noexcept;

        atomic_flag() noexcept = default;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
    };
}
```

```

    atomic_flag& operator=(const atomic_flag&) volatile = delete;
} atomic_flag;

bool atomic_flag_test_and_set(volatile atomic_flag*) noexcept;
bool atomic_flag_test_and_set(atomic_flag*) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag*, memory_order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag*, memory_order) noexcept;
void atomic_flag_clear(volatile atomic_flag*) noexcept;
void atomic_flag_clear(atomic_flag*) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag*, memory_order) noexcept;
void atomic_flag_clear_explicit(atomic_flag*, memory_order) noexcept;

#define ATOMIC_FLAG_INIT see below
}

```

- <sup>1</sup> The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.
- <sup>2</sup> Operations on an object of type `atomic_flag` shall be lock-free. [*Note:* Hence the operations should also be address-free. No other type requires lock-free operations, so the `atomic_flag` type is the minimum hardware-implemented type needed to conform to this International standard. The remaining types can be emulated with `atomic_flag`, though with less than ideal properties. — *end note*]
- <sup>3</sup> The `atomic_flag` type shall have standard layout. It shall have a trivial default constructor, a deleted copy constructor, a deleted copy assignment operator, and a trivial destructor.
- <sup>4</sup> The macro `ATOMIC_FLAG_INIT` shall be defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static. Unless initialized with `ATOMIC_FLAG_INIT`, it is unspecified whether an `atomic_flag` object has an initial state of set or clear.

```

bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order_seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order_seq_cst) noexcept;

```

- <sup>5</sup> *Effects:* Atomically sets the value pointed to by `object` or by `this` to true. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (1.10).
- <sup>6</sup> *Returns:* Atomically, the value of the object immediately before the effects.

```

void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order_seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order_seq_cst) noexcept;

```

- <sup>7</sup> *Requires:* The `order` argument shall not be `memory_order_consume`, `memory_order_acquire`, nor `memory_order_acq_rel`.
- <sup>8</sup> *Effects:* Atomically sets the value pointed to by `object` or by `this` to false. Memory is affected according to the value of `order`.

## 29.8 Fences

[atomics.fences]

- <sup>1</sup> This section introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.
- <sup>2</sup> A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*, both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- <sup>3</sup> A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X* modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- <sup>4</sup> An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B* and reads the value written by *A* or a value written by any side effect in the release sequence headed by *A*.

```
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

<sup>5</sup> *Effects:* Depending on the value of `order`, this operation:

- (5.1) — has no effects, if `order == memory_order_relaxed`;
- (5.2) — is an acquire fence, if `order == memory_order_acquire || order == memory_order_consume`;
- (5.3) — is a release fence, if `order == memory_order_release`;
- (5.4) — is both an acquire fence and a release fence, if `order == memory_order_acq_rel`;
- (5.5) — is a sequentially consistent acquire and release fence, if `order == memory_order_seq_cst`.

```
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

- <sup>6</sup> *Effects:* Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.
- <sup>7</sup> *Note:* `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler.
- <sup>8</sup> *Note:* compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted.

## 30 Thread support library

[thread]

### 30.1 General

[thread.general]

- <sup>1</sup> The following subclauses describe components to create and manage threads (1.10), perform mutual exclusion, and communicate conditions and values between threads, as summarized in Table 166.

Table 166 — Thread support library summary

| Subclause                | Header(s)                 |
|--------------------------|---------------------------|
| 30.2 Requirements        |                           |
| 30.3 Threads             | <thread>                  |
| 30.4 Mutual exclusion    | <mutex><br><shared_mutex> |
| 30.5 Condition variables | <condition_variable>      |
| 30.6 Futures             | <future>                  |

### 30.2 Requirements

[thread.req]

#### 30.2.1 Template parameter names

[thread.req.paramname]

- <sup>1</sup> Throughout this Clause, the names of template parameters are used to express type requirements. If a template parameter is named `Predicate`, `operator()` applied to the template argument shall return a value that is convertible to `bool`.

#### 30.2.2 Exceptions

[thread.req.exception]

- <sup>1</sup> Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.7). Such exceptions shall be thrown if any of the function's error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage shall be reported as described in 17.6.5.12.

[*Example:* Consider a function in this clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — *end example*]

- <sup>2</sup> The `error_code` reported by such an exception's `code()` member function shall compare equal to one of the conditions specified in the function's error condition element.

#### 30.2.3 Native handles

[thread.req.native]

- <sup>1</sup> Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined. [*Note:* These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — *end note*]

### 30.2.4 Timing specifications

[thread.req.timing]

- <sup>1</sup> Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in 20.15.
- <sup>2</sup> Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration  $D_i$ . Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration  $D_m$ . The delay durations may vary from timeout to timeout, but in all cases shorter is better.
- <sup>3</sup> The member functions whose names end in `_for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.<sup>338</sup> Given a duration argument  $D_t$ , the real-time duration of the timeout is  $D_t + D_i + D_m$ .
- <sup>4</sup> The member functions whose names end in `_until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument  $C_t$ , the clock time point of the return from timeout should be  $C_t + D_i + D_m$  when the clock is not adjusted during the timeout. If the clock is adjusted to the time  $C_a$  during the timeout, the behavior should be as follows:
  - (4.1) — if  $C_a > C_t$ , the waiting function should wake as soon as possible, i.e.  $C_a + D_i + D_m$ , since the timeout is already satisfied. [Note: This specification may result in the total duration of the wait decreasing when measured against a steady clock. — end note]
  - (4.2) — if  $C_a \leq C_t$ , the waiting function should not time out until `Clock::now()` returns a time  $C_n \geq C_t$ , i.e. waking at  $C_t + D_i + D_m$ . [Note: When the clock is adjusted backwards, this specification may result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification may result in the total duration of the wait decreasing when measured against a steady clock. — end note]

An implementation shall return from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between  $C_t$  and the time point of the call to the `_until` function. [Note: Implementations should decrease the duration of the wait when the clock is adjusted forwards. — end note]

- <sup>5</sup> [Note: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts might not provide useful functionality. — end note]
- <sup>6</sup> The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the *native resolution*.
- <sup>7</sup> Implementation-provided clocks that are used for these functions shall meet the `TrivialClock` requirements (20.15.3).
- <sup>8</sup> A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as *timeout-related exceptions*. [Note: instantiations of clock, time point and duration types supplied by the implementation as specified in 20.15.7 do not throw exceptions. — end note]

### 30.2.5 Requirements for Lockable types

[thread.req.lockable]

#### 30.2.5.1 In general

[thread.req.lockable.general]

- <sup>1</sup> An *execution agent* is an entity such as a thread that may perform work in parallel with other execution agents. [Note: Implementations or users may introduce other kinds of agents such as processes or thread-pool

---

338) All implementations for which standard time units are meaningful must necessarily have a steady clock within their hardware implementation.

tasks. — *end note*] The calling agent is determined by context, e.g. the calling thread that contains the call, and so on.

- <sup>2</sup> [ *Note*: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — *end note*]
- <sup>3</sup> The standard library templates `unique_lock` (30.4.2.2), `lock_guard` (30.4.2.1), `lock`, `try_lock` (30.4.3), and `condition_variable_any` (30.5.2) all operate on user-supplied lockable objects. The `BasicLockable` requirements, the `Lockable` requirements, and the `TimedLockable` requirements list the requirements imposed by these library types in order to acquire or release ownership of a lock by a given execution agent. [ *Note*: The nature of any lock ownership and any synchronization it may entail are not part of these requirements. — *end note*]

### 30.2.5.2 BasicLockable requirements

[thread.req.lockable.basic]

- <sup>1</sup> A type `L` meets the `BasicLockable` requirements if the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.lock()`

- <sup>2</sup> *Effects*: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.unlock()`

- <sup>3</sup> *Requires*: The current execution agent shall hold a lock on `m`.
- <sup>4</sup> *Effects*: Releases a lock on `m` held by the current execution agent.
- <sup>5</sup> *Throws*: Nothing.

### 30.2.5.3 Lockable requirements

[thread.req.lockable.req]

- <sup>1</sup> A type `L` meets the `Lockable` requirements if it meets the `BasicLockable` requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.try_lock()`

- <sup>2</sup> *Effects*: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
- <sup>3</sup> *Return type*: `bool`.
- <sup>4</sup> *Returns*: `true` if the lock was acquired, `false` otherwise.

### 30.2.5.4 TimedLockable requirements

[thread.req.lockable.timed]

- <sup>1</sup> A type `L` meets the `TimedLockable` requirements if it meets the `Lockable` requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of an instantiation of `duration` (20.15.5), and `abs_time` denotes a value of an instantiation of `time_point` (20.15.6)).

`m.try_lock_for(rel_time)`

- <sup>2</sup> *Effects*: Attempts to acquire a lock for the current execution agent within the relative timeout (30.2.4) specified by `rel_time`. The function shall not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
- <sup>3</sup> *Return type*: `bool`.
- <sup>4</sup> *Returns*: `true` if the lock was acquired, `false` otherwise.

```
m.try_lock_until(abs_time)
```

- 5 *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (30.2.4) specified by `abs_time`. The function shall not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
- 6 *Return type:* `bool`.
- 7 *Returns:* `true` if the lock was acquired, `false` otherwise.

### 30.2.6 decay\_copy

[thread.decaycopy]

- 1 In several places in this Clause the operation *DECAY\_COPY*(`x`) is used. All such uses mean call the function `decay_copy(x)` and use the result, where `decay_copy` is defined as follows:

```
template <class T> decay_t<T> decay_copy(T&& v)
{ return std::forward<T>(v); }
```

## 30.3 Threads

[thread.threads]

- 1 30.3 describes components that can be used to create and manage threads. [ *Note:* These threads are intended to map one-to-one with operating system threads. — *end note* ]

### Header <thread> synopsis

```
namespace std {
    class thread;

    void swap(thread& x, thread& y) noexcept;

    namespace this_thread {
        thread::id get_id() noexcept;

        void yield() noexcept;
        template <class Clock, class Duration>
            void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
        template <class Rep, class Period>
            void sleep_for(const chrono::duration<Rep, Period>& rel_time);
    }
}
```

#### 30.3.1 Class thread

[thread.thread.class]

- 1 The class `thread` provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A `thread` object uniquely represents a particular thread of execution. That representation may be transferred to other `thread` objects in such a way that no two `thread` objects simultaneously represent the same thread of execution. A thread of execution is *detached* when no `thread` object represents that thread. Objects of class `thread` can be in a state that does not represent a thread of execution. [ *Note:* A `thread` object does not represent a thread of execution after default construction, after being moved from, or after a successful call to `detach` or `join`. — *end note* ]

```
namespace std {
    class thread {
    public:
        // types:
        class id;
```

```

typedef implementation-defined native_handle_type; // See 30.2.3

// construct/copy/destroy:
thread() noexcept;
template <class F, class ...Args> explicit thread(F&& f, Args&&... args);
~thread();
thread(const thread&) = delete;
thread(thread&&) noexcept;
thread& operator=(const thread&) = delete;
thread& operator=(thread&&) noexcept;

// members:
void swap(thread&) noexcept;
bool joinable() const noexcept;
void join();
void detach();
id get_id() const noexcept;
native_handle_type native_handle(); // See 30.2.3

// static members:
static unsigned hardware_concurrency() noexcept;
};
}

```

### 30.3.1.1 Class `thread::id`

[thread.thread.id]

```

namespace std {
    class thread::id {
    public:
        id() noexcept;

        bool operator==(thread::id x, thread::id y) noexcept;
        bool operator!=(thread::id x, thread::id y) noexcept;
        bool operator<(thread::id x, thread::id y) noexcept;
        bool operator<=(thread::id x, thread::id y) noexcept;
        bool operator>(thread::id x, thread::id y) noexcept;
        bool operator>=(thread::id x, thread::id y) noexcept;

        template<class charT, class traits>
            basic_ostream<charT, traits>&
                operator<< (basic_ostream<charT, traits>& out, thread::id id);

        // Hash support
        template <class T> struct hash;
        template <> struct hash<thread::id>;
    }
}

```

- <sup>1</sup> An object of type `thread::id` provides a unique identifier for each thread of execution and a single distinct value for all `thread` objects that do not represent a thread of execution (30.3.1). Each thread of execution has an associated `thread::id` object that is not equal to the `thread::id` object of any other thread of execution and that is not equal to the `thread::id` object of any `std::thread` object that does not represent threads of execution.
- <sup>2</sup> `thread::id` shall be a trivially copyable class (Clause 9). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.

3 [ *Note:* Relational operators allow `thread::id` objects to be used as keys in associative containers. — *end note*]

`id()` `noexcept`;

4 *Effects:* Constructs an object of type `id`.

5 *Postconditions:* The constructed object does not represent a thread of execution.

`bool operator==(thread::id x, thread::id y) noexcept`;

6 *Returns:* `true` only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

`bool operator!=(thread::id x, thread::id y) noexcept`;

7 *Returns:* `!(x == y)`

`bool operator<(thread::id x, thread::id y) noexcept`;

8 *Returns:* A value such that `operator<` is a total ordering as described in 25.5.

`bool operator<=(thread::id x, thread::id y) noexcept`;

9 *Returns:* `!(y < x)`

`bool operator>(thread::id x, thread::id y) noexcept`;

10 *Returns:* `y < x`

`bool operator>=(thread::id x, thread::id y) noexcept`;

11 *Returns:* `!(x < y)`

`template<class charT, class traits>`

`basic_ostream<charT, traits>&`

`operator<< (basic_ostream<charT, traits>&& out, thread::id id);`

12 *Effects:* Inserts an unspecified text representation of `id` into `out`. For two objects of type `thread::id` `x` and `y`, if `x == y` the `thread::id` objects shall have the same text representation and if `x != y` the `thread::id` objects shall have distinct text representations.

13 *Returns:* `out`

`template <> struct hash<thread::id>;`

14 The template specialization shall meet the requirements of class template `hash` (20.12.14).

### 30.3.1.2 thread constructors

[`thread.thread.constr`]

`thread()` `noexcept`;

1 *Effects:* Constructs a `thread` object that does not represent a thread of execution.

2 *Postcondition:* `get_id() == id()`

`template <class F, class ...Args> explicit thread(F&& f, Args&&... args);`

- 3 *Requires:* `F` and each `Ti` in `Args` shall satisfy the `MoveConstructible` requirements. `INVOKE(DECAY_COPY( std::forward<F>(f)), DECAY_COPY(std::forward<Args>(args))...)` (20.12.2) shall be a valid expression.
- 4 *Remarks:* This constructor shall not participate in overload resolution if `decay_t<F>` is the same type as `std::thread`.
- 5 *Effects:* Constructs an object of type `thread`. The new thread of execution executes `INVOKE(DECAY_COPY( std::forward<F>(f)), DECAY_COPY(std::forward<Args>(args))...)` with the calls to `DECAY_COPY` being evaluated in the constructing thread. Any return value from this invocation is ignored. [ *Note:* This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — *end note* ] If the invocation of `INVOKE(DECAY_COPY( std::forward<F>(f)), DECAY_COPY(std::forward<Args>(args))...)` terminates with an uncaught exception, `std::terminate` shall be called.
- 6 *Synchronization:* The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.
- 7 *Postconditions:* `get_id() != id()`. `*this` represents the newly started thread.
- 8 *Throws:* `system_error` if unable to start the new thread.
- 9 *Error conditions:*
- (9.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
```

- 10 *Effects:* Constructs an object of type `thread` from `x`, and sets `x` to a default constructed state.
- 11 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

### 30.3.1.3 thread destructor

[thread.thread.destr]

```
~thread();
```

- 1 If `joinable()`, calls `std::terminate()`. Otherwise, has no effects. [ *Note:* Either implicitly detaching or joining a `joinable()` thread in its destructor could result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is raised. Thus the programmer must ensure that the destructor is never executed while the thread is still joinable. — *end note* ]

### 30.3.1.4 thread assignment

[thread.thread.assign]

```
thread& operator=(thread&& x) noexcept;
```

- 1 *Effects:* If `joinable()`, calls `std::terminate()`. Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.
- 2 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.
- 3 *Returns:* `*this`

### 30.3.1.5 thread members

[thread.thread.member]

```
void swap(thread& x) noexcept;
```

- 1 *Effects:* Swaps the state of `*this` and `x`.

```
bool joinable() const noexcept;
```

2 *Returns:* `get_id() != id()`

`void join();`

3 *Effects:* Blocks until the thread represented by `*this` has completed.

4 *Synchronization:* The completion of the thread represented by `*this` synchronizes with (1.10) the corresponding successful `join()` return. [*Note:* Operations on `*this` are not synchronized. — *end note*]

5 *Postconditions:* The thread represented by `*this` has completed. `get_id() == id()`.

6 *Throws:* `system_error` when an exception is required (30.2.2).

7 *Error conditions:*

(7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `this->get_id() == std::this_thread::get_id()`.

(7.2) — `no_such_process` — if the thread is not valid.

(7.3) — `invalid_argument` — if the thread is not joinable.

`void detach();`

8 *Effects:* The thread represented by `*this` continues execution without the calling thread blocking. When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When the thread previously represented by `*this` ends execution, the implementation shall release any owned resources.

9 *Postcondition:* `get_id() == id()`.

10 *Throws:* `system_error` when an exception is required (30.2.2).

11 *Error conditions:*

(11.1) — `no_such_process` — if the thread is not valid.

(11.2) — `invalid_argument` — if the thread is not joinable.

`id get_id() const noexcept;`

12 *Returns:* A default constructed `id` object if `*this` does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by `*this`.

### 30.3.1.6 thread static members

[`thread.thread.static`]

`unsigned hardware_concurrency() noexcept;`

1 *Returns:* The number of hardware thread contexts. [*Note:* This value should only be considered to be a hint. — *end note*] If this value is not computable or well defined an implementation should return 0.

### 30.3.1.7 thread specialized algorithms

[`thread.thread.algorithm`]

`void swap(thread& x, thread& y) noexcept;`

1 *Effects:* As if by `x.swap(y)`.

**30.3.2 Namespace `this_thread`****[`thread.thread.this`]**

```

namespace std::this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template <class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template <class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}

```

```

thread::id this_thread::get_id() noexcept;

```

- <sup>1</sup> *Returns:* An object of type `thread::id` that uniquely identifies the current thread of execution. No other thread of execution shall have this id and this thread of execution shall always have this id. The object returned shall not compare equal to a default constructed `thread::id`.

```

void this_thread::yield() noexcept;

```

- <sup>2</sup> *Effects:* Offers the implementation the opportunity to reschedule.

- <sup>3</sup> *Synchronization:* None.

```

template <class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);

```

- <sup>4</sup> *Effects:* Blocks the calling thread for the absolute timeout (30.2.4) specified by `abs_time`.

- <sup>5</sup> *Synchronization:* None.

- <sup>6</sup> *Throws:* Timeout-related exceptions (30.2.4).

```

template <class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);

```

- <sup>7</sup> *Effects:* Blocks the calling thread for the relative timeout (30.2.4) specified by `rel_time`.

- <sup>8</sup> *Synchronization:* None.

- <sup>9</sup> *Throws:* Timeout-related exceptions (30.2.4).

**30.4 Mutual exclusion****[`thread.mutex`]**

- <sup>1</sup> This section provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (1.10).

**Header `<mutex>` synopsis**

```

namespace std {
    class mutex;
    class recursive_mutex;
    class timed_mutex;
    class recursive_timed_mutex;

    struct defer_lock_t { };
    struct try_to_lock_t { };
    struct adopt_lock_t { };

    constexpr defer_lock_t defer_lock { };
    constexpr try_to_lock_t try_to_lock { };
    constexpr adopt_lock_t adopt_lock { };
}

```

```

template <class... MutexTypes> class lock_guard;
template <class Mutex> class unique_lock;

template <class Mutex>
    void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

template <class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
template <class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

struct once_flag {
    constexpr once_flag() noexcept;

    once_flag(const once_flag&) = delete;
    once_flag& operator=(const once_flag&) = delete;
};

template<class Callable, class ...Args>
    void call_once(once_flag& flag, Callable&& func, Args&&... args);
}

```

#### Header <shared\_mutex> synopsis

```

namespace std {
    class shared_mutex;
    class shared_timed_mutex;
    template <class Mutex> class shared_lock;
    template <class Mutex>
        void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}

```

### 30.4.1 Mutex requirements

[thread.mutex.requirements]

#### 30.4.1.1 In general

[thread.mutex.requirements.general]

- <sup>1</sup> A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (30.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

#### 30.4.1.2 Mutex types

[thread.mutex.requirements.mutex]

- <sup>1</sup> The *mutex types* are the standard library types `std::mutex`, `std::recursive_mutex`, `std::timed_mutex`, `std::recursive_timed_mutex`, `std::shared_mutex`, and `std::shared_timed_mutex`. They shall meet the requirements set out in this section. In this description, *m* denotes an object of a mutex type.
- <sup>2</sup> The mutex types shall meet the Lockable requirements (30.2.5.3).
- <sup>3</sup> The mutex types shall be `DefaultConstructible` and `Destructible`. If initialization of an object of a mutex type fails, an exception of type `system_error` shall be thrown. The mutex types shall not be copyable or movable.
- <sup>4</sup> The error conditions for error codes, if any, reported by member functions of the mutex types shall be:
  - (4.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.
  - (4.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
  - (4.3) — `device_or_resource_busy` — if any native handle type manipulated is already locked.

(4.4) — **invalid\_argument** — if any native handle type manipulated as part of mutex construction is incorrect.

5 The implementation shall provide lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (1.10). The lock and unlock operations on a single mutex shall appear to occur in a single total order. [ *Note*: this can be viewed as the modification order (1.10) of the mutex. — *end note*] [ *Note*: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization should be used to ensure that mutex objects are initialized and visible to other threads. — *end note*]

6 The expression `m.lock()` shall be well-formed and have the following semantics:

7 *Requires*: If `m` is of type `std::mutex`, `std::timed_mutex`, `std::shared_mutex`, or `std::shared_timed_mutex`, the calling thread does not own the mutex.

8 *Effects*: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

9 *Postcondition*: The calling thread owns the mutex.

10 *Return type*: `void`

11 *Synchronization*: Prior `unlock()` operations on the same object shall *synchronize with* (1.10) this operation.

12 *Throws*: `system_error` when an exception is required (30.2.2).

13 *Error conditions*:

(13.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(13.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

(13.3) — `device_or_resource_busy` — if the mutex is already locked and blocking is not possible.

14 The expression `m.try_lock()` shall be well-formed and have the following semantics:

15 *Requires*: If `m` is of type `std::mutex`, `std::timed_mutex`, `std::shared_mutex`, or `std::shared_timed_mutex`, the calling thread does not own the mutex.

16 *Effects*: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread. [ *Note*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (Clause 29). — *end note*] An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

17 *Return type*: `bool`

18 *Returns*: `true` if ownership of the mutex was obtained for the calling thread, otherwise `false`.

19 *Synchronization*: If `try_lock()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (1.10) this operation. [ *Note*: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — *end note*]

20 *Throws*: Nothing.

21 The expression `m.unlock()` shall be well-formed and have the following semantics:

22 *Requires*: The calling thread shall own the mutex.

23 *Effects*: Releases the calling thread's ownership of the mutex.

24 *Return type*: `void`

25 *Synchronization*: This operation synchronizes with (1.10) subsequent lock operations that obtain ownership on the same object.

26 *Throws*: Nothing.

## 30.4.1.2.1 Class mutex

[thread.mutex.class]

```

namespace std {
    class mutex {
    public:
        constexpr mutex() noexcept;
        ~mutex();

        mutex(const mutex&) = delete;
        mutex& operator=(const mutex&) = delete;

        void lock();
        bool try_lock();
        void unlock();

        typedef implementation-defined native_handle_type; // See 30.2.3
        native_handle_type native_handle(); // See 30.2.3
    };
}

```

- <sup>1</sup> The class `mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the owning thread has released ownership with a call to `unlock()`.
- <sup>2</sup> [Note: After a thread A has called `unlock()`, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn't access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note]
- <sup>3</sup> The class `mutex` shall satisfy all the `Mutex` requirements (30.4.1). It shall be a standard-layout class (Clause 9).
- <sup>4</sup> [Note: A program may deadlock if the thread that owns a `mutex` object calls `lock()` on that object. If the implementation can detect the deadlock, a `resource_deadlock_would_occur` error condition may be observed. — end note]
- <sup>5</sup> The behavior of a program is undefined if it destroys a `mutex` object owned by any thread or a thread terminates while owning a `mutex` object.

## 30.4.1.2.2 Class recursive\_mutex

[thread.mutex.recursive]

```

namespace std {
    class recursive_mutex {
    public:
        recursive_mutex();
        ~recursive_mutex();

        recursive_mutex(const recursive_mutex&) = delete;
        recursive_mutex& operator=(const recursive_mutex&) = delete;

        void lock();
        bool try_lock() noexcept;
        void unlock();

        typedef implementation-defined native_handle_type; // See 30.2.3
        native_handle_type native_handle(); // See 30.2.3
    };
}

```

- <sup>1</sup> The class `recursive_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the first thread has completely released ownership.
- <sup>2</sup> The class `recursive_mutex` shall satisfy all the Mutex requirements (30.4.1). It shall be a standard-layout class (Clause 9).
- <sup>3</sup> A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` shall fail, and additional calls to `lock()` shall throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.
- <sup>4</sup> The behavior of a program is undefined if:
  - (4.1) — it destroys a `recursive_mutex` object owned by any thread or
  - (4.2) — a thread terminates while owning a `recursive_mutex` object.

### 30.4.1.3 Timed mutex types

[`thread.timedmutex.requirements`]

- <sup>1</sup> The *timed mutex types* are the standard library types `std::timed_mutex`, `std::recursive_timed_mutex`, and `std::shared_timed_mutex`. They shall meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (20.15.5), and `abs_time` denotes an object of an instantiation of `time_point` (20.15.6).
- <sup>2</sup> The timed mutex types shall meet the `TimedLockable` requirements (30.2.5.4).
- <sup>3</sup> The expression `m.try_lock_for(rel_time)` shall be well-formed and have the following semantics:
  - <sup>4</sup> *Requires:* If `m` is of type `std::timed_mutex` or `std::shared_timed_mutex`, the calling thread does not own the mutex.
  - <sup>5</sup> *Effects:* The function attempts to obtain ownership of the mutex within the relative timeout (30.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function shall return within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object. [*Note:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]
  - <sup>6</sup> *Return type:* `bool`
  - <sup>7</sup> *Returns:* `true` if ownership was obtained, otherwise `false`.
  - <sup>8</sup> *Synchronization:* If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (1.10) this operation.
  - <sup>9</sup> *Throws:* Timeout-related exceptions (30.2.4).
- <sup>10</sup> The expression `m.try_lock_until(abs_time)` shall be well-formed and have the following semantics:
  - <sup>11</sup> *Requires:* If `m` is of type `std::timed_mutex` or `std::shared_timed_mutex`, the calling thread does not own the mutex.
  - <sup>12</sup> *Effects:* The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function shall return before the absolute timeout (30.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object. [*Note:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

- 13     *Return type:* `bool`
- 14     *Returns:* `true` if ownership was obtained, otherwise `false`.
- 15     *Synchronization:* If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (1.10) this operation.
- 16     *Throws:* Timeout-related exceptions (30.2.4).

**30.4.1.3.1 Class `timed_mutex`**[`thread.timedmutex.class`]

```

namespace std {
    class timed_mutex {
    public:
        timed_mutex();
        ~timed_mutex();

        timed_mutex(const timed_mutex&) = delete;
        timed_mutex& operator=(const timed_mutex&) = delete;

        void lock(); // blocking
        bool try_lock();
        template <class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template <class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        typedef implementation-defined native_handle_type; // See 30.2.3
        native_handle_type native_handle(); // See 30.2.3
    };
}

```

- 1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- 2 The class `timed_mutex` shall satisfy all of the `TimedMutex` requirements (30.4.1.3). It shall be a standard-layout class (Clause 9).
- 3 The behavior of a program is undefined if:
- (3.1) — it destroys a `timed_mutex` object owned by any thread,
  - (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
  - (3.3) — a thread terminates while owning a `timed_mutex` object.

**30.4.1.3.2 Class `recursive_timed_mutex`**[`thread.timedmutex.recursive`]

```

namespace std {
    class recursive_timed_mutex {
    public:
        recursive_timed_mutex();
        ~recursive_timed_mutex();

        recursive_timed_mutex(const recursive_timed_mutex&) = delete;

```

```

recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

void lock(); // blocking
bool try_lock() noexcept;
template <class Rep, class Period>
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template <class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock();

typedef implementation-defined native_handle_type; // See 30.2.3
native_handle_type native_handle(); // See 30.2.3
};
}

```

- <sup>1</sup> The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- <sup>2</sup> The class `recursive_timed_mutex` shall satisfy all of the `TimedMutex` requirements (30.4.1.3). It shall be a standard-layout class (Clause 9).
- <sup>3</sup> A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` shall fail, and additional calls to `lock()` shall throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.
- <sup>4</sup> The behavior of a program is undefined if:
  - (4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or
  - (4.2) — a thread terminates while owning a `recursive_timed_mutex` object.

#### 30.4.1.4 Shared mutex types

[thread.sharedmutex.requirements]

- <sup>1</sup> The standard library types `std::shared_mutex` and `std::shared_timed_mutex` are *shared mutex types*. Shared mutex types shall meet the requirements of mutex types (30.4.1.2), and additionally shall meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.
- <sup>2</sup> In addition to the exclusive lock ownership mode specified in 30.4.1.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent shall hold a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but shall be at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents shall block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.
- <sup>3</sup> The expression `m.lock_shared()` shall be well-formed and have the following semantics:
  - <sup>4</sup> *Requires:* The calling thread has no ownership of the mutex.

*Effects:* Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock shall not have been acquired for the current thread.

*Postcondition:* The calling thread has a shared lock on the mutex.

*Return type:* `void`.

*Synchronization:* Prior `unlock()` operations on the same object shall synchronize with (1.10) this operation.

*Throws:* `system_error` when an exception is required (30.2.2).

*Error conditions:*

(10.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

(10.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

(10.3) — `device_or_resource_busy` — if the mutex is already locked and blocking is not possible.

The expression `m.unlock_shared()` shall be well-formed and have the following semantics:

*Requires:* The calling thread shall hold a shared lock on the mutex.

*Effects:* Releases a shared lock on the mutex held by the calling thread.

*Return type:* `void`.

*Synchronization:* This operation synchronizes with (1.10) subsequent `lock()` operations that obtain ownership on the same object.

*Throws:* Nothing.

The expression `m.try_lock_shared()` shall be well-formed and have the following semantics:

*Requires:* The calling thread has no ownership of the mutex.

*Effects:* Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

*Return type:* `bool`.

*Returns:* `true` if the shared ownership lock was acquired, `false` otherwise.

*Synchronization:* If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (1.10) this operation.

*Throws:* Nothing.

#### 30.4.1.4.1 Class `shared_mutex`

[`thread.sharedmutex.class`]

```
namespace std {
    class shared_mutex {
    public:
        shared_mutex();
        ~shared_mutex();

        shared_mutex(const shared_mutex&) = delete;
        shared_mutex& operator=(const shared_mutex&) = delete;

        // Exclusive ownership
        void lock(); // blocking
        bool try_lock();
        void unlock();
    };
}
```

```

    // Shared ownership
    void lock_shared(); // blocking
    bool try_lock_shared();
    void unlock_shared();

    typedef implementation-defined native_handle_type; // See 30.2.3
    native_handle_type native_handle(); // See 30.2.3
};
}

```

- 1 The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.
- 2 The class `shared_mutex` shall satisfy all of the requirements for shared mutexes (30.4.1.4). It shall be a standard-layout class (Clause 9).
- 3 The behavior of a program is undefined if:
  - (3.1) — it destroys a `shared_mutex` object owned by any thread,
  - (3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or
  - (3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.

4 `shared_mutex` may be a synonym for `shared_timed_mutex`.

#### 30.4.1.5 Shared timed mutex types [thread.sharedtimedmutex.requirements]

- 1 The standard library type `std::shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types shall meet the requirements of timed mutex types (30.4.1.3), shared mutex types (30.4.1.4), and additionally shall meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_type` denotes an object of an instantiation of `duration` (20.15.5), and `abs_time` denotes an object of an instantiation of `time_point` (20.15.6).
- 2 The expression `m.try_lock_shared_for(rel_time)` shall be well-formed and have the following semantics:
  - 3 *Requires:* The calling thread has no ownership of the mutex.
  - 4 *Effects:* Attempts to obtain shared lock ownership for the calling thread within the relative timeout (30.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function shall return within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object. [ *Note:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note* ] If an exception is thrown then a shared lock shall not have been acquired for the current thread.
  - 5 *Return type:* `bool`.
  - 6 *Returns:* `true` if the shared lock was acquired, `false` otherwise.
  - 7 *Synchronization:* If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (1.10) this operation.
  - 8 *Throws:* Timeout-related exceptions (30.2.4).
- 9 The expression `m.try_lock_shared_until(abs_time)` shall be well-formed and have the following semantics:
  - 10 *Requires:* The calling thread has no ownership of the mutex.
  - 11 *Effects:* The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function shall return before the absolute timeout (30.2.4) specified by `abs_time` only

if it has obtained shared ownership of the mutex object. [ *Note:* As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note* ] If an exception is thrown then a shared lock shall not have been acquired for the current thread.

12 *Return type:* `bool`.

13 *Returns:* `true` if the shared lock was acquired, `false` otherwise.

14 *Synchronization:* If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (1.10) this operation.

15 *Throws:* Timeout-related exceptions (30.2.4).

#### 30.4.1.5.1 Class `shared_timed_mutex`

[`thread.sharedtimedmutex.class`]

```
namespace std {
    class shared_timed_mutex {
    public:
        shared_timed_mutex();
        ~shared_timed_mutex();

        shared_timed_mutex(const shared_timed_mutex&) = delete;
        shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

        // Exclusive ownership
        void lock(); // blocking
        bool try_lock();
        template <class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template <class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        // Shared ownership
        void lock_shared(); // blocking
        bool try_lock_shared();
        template <class Rep, class Period>
            bool
            try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
        template <class Clock, class Duration>
            bool
            try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock_shared();
    };
}
```

1 The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_timed_mutex` shall satisfy all of the requirements for shared timed mutexes (30.4.1.5). It shall be a standard-layout class (Clause 9).

3 The behavior of a program is undefined if:

- (3.1) — it destroys a `shared_timed_mutex` object owned by any thread,
- (3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
- (3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

### 30.4.2 Locks

[thread.lock]

- <sup>1</sup> A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references. [ *Note*: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — *end note* ]
- <sup>2</sup> Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```
namespace std {
    struct defer_lock_t { };           // do not acquire ownership of the mutex
    struct try_to_lock_t { };         // try to acquire ownership of the mutex
                                        // without blocking
    struct adopt_lock_t { };          // assume the calling thread has already
                                        // obtained mutex ownership and manage it

    constexpr defer_lock_t    defer_lock { };
    constexpr try_to_lock_t   try_to_lock { };
    constexpr adopt_lock_t    adopt_lock { };
}
```

#### 30.4.2.1 Class template lock\_guard

[thread.lock.guard]

```
namespace std {
    template <class... MutexTypes>
    class lock_guard {
    public:
        typedef Mutex mutex_type;     // If MutexTypes... consists of the single type Mutex

        explicit lock_guard(MutexTypes&... m);
        lock_guard(MutexTypes&... m, adopt_lock_t);
        ~lock_guard();

        lock_guard(lock_guard const&) = delete;
        lock_guard& operator=(lock_guard const&) = delete;

    private:
        tuple<MutexTypes&...> pm;     // exposition only
    };
}
```

- <sup>1</sup> An object of type `lock_guard` controls the ownership of lockable objects within a scope. A `lock_guard` object maintains ownership of lockable objects throughout the `lock_guard` object's lifetime (3.8). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `lock_guard` object. When `sizeof...(MutexTypes)` is 1, the supplied `Mutex` type shall meet the `BasicLockable` requirements. Otherwise, each of the mutex types shall meet the `Lockable` requirements (30.2.5.2).

```
explicit lock_guard(MutexTypes&... m);
```

- <sup>2</sup> *Requires*: If a `MutexTypes` type is not a recursive mutex, the calling thread does not own the corresponding mutex element of `m`.
- <sup>3</sup> *Effects*: Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is 0, no effects. Otherwise if `sizeof...(MutexTypes)` is 1, then `m.lock()`. Otherwise, then `lock(m...)`.

```
lock_guard(MutexTypes&... m, adopt_lock_t);
```

4     *Requires:* The calling thread owns all the mutexes in m.

5     *Effects:* Initializes pm with tie(m...).

6     *Throws:* Nothing.

```
~lock_guard();
```

7     *Effects:* For all i in [0, sizeof...(MutexTypes)), get<i>(pm).unlock().

### 30.4.2.2 Class template unique\_lock

[thread.lock.unique]

```
namespace std {
    template <class Mutex>
    class unique_lock {
    public:
        typedef Mutex mutex_type;

        // 30.4.2.2.1, construct/copy/destroy:
        unique_lock() noexcept;
        explicit unique_lock(mutex_type& m);
        unique_lock(mutex_type& m, defer_lock_t) noexcept;
        unique_lock(mutex_type& m, try_to_lock_t);
        unique_lock(mutex_type& m, adopt_lock_t);
        template <class Clock, class Duration>
            unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template <class Rep, class Period>
            unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~unique_lock();

        unique_lock(unique_lock const&) = delete;
        unique_lock& operator=(unique_lock const&) = delete;

        unique_lock(unique_lock&& u) noexcept;
        unique_lock& operator=(unique_lock&& u);

        // 30.4.2.2.2, locking:
        void lock();
        bool try_lock();

        template <class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template <class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

        void unlock();

        // 30.4.2.2.3, modifiers:
        void swap(unique_lock& u) noexcept;
        mutex_type* release() noexcept;

        // 30.4.2.2.4, observers:
        bool owns_lock() const noexcept;
        explicit operator bool () const noexcept;
        mutex_type* mutex() const noexcept;
```

```

private:
    mutex_type* pm; // exposition only
    bool owns;      // exposition only
};

template <class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
}

```

- <sup>1</sup> An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (3.8) of the `unique_lock` object. The supplied `Mutex` type shall meet the `BasicLockable` requirements (30.2.5.2).
- <sup>2</sup> [*Note: `unique_lock<Mutex>` meets the `BasicLockable` requirements. If `Mutex` meets the `Lockable` requirements (30.2.5.3), `unique_lock<Mutex>` also meets the `Lockable` requirements; if `Mutex` meets the `TimedLockable` requirements (30.2.5.4), `unique_lock<Mutex>` also meets the `TimedLockable` requirements.* — end note]

#### 30.4.2.2.1 `unique_lock` constructors, destructor, and assignment [thread.lock.unique.cons]

```
unique_lock() noexcept;
```

- <sup>1</sup> *Effects:* Constructs an object of type `unique_lock`.

- <sup>2</sup> *Postconditions:* `pm == 0` and `owns == false`.

```
explicit unique_lock(mutex_type& m);
```

- <sup>3</sup> *Requires:* If `mutex_type` is not a recursive mutex the calling thread does not own the mutex.

- <sup>4</sup> *Effects:* Constructs an object of type `unique_lock` and calls `m.lock()`.

- <sup>5</sup> *Postconditions:* `pm == addressof(m)` and `owns == true`.

```
unique_lock(mutex_type& m, defer_lock_t) noexcept;
```

- <sup>6</sup> *Effects:* Constructs an object of type `unique_lock`.

- <sup>7</sup> *Postconditions:* `pm == addressof(m)` and `owns == false`.

```
unique_lock(mutex_type& m, try_to_lock_t);
```

- <sup>8</sup> *Requires:* The supplied `Mutex` type shall meet the `Lockable` requirements (30.2.5.3). If `mutex_type` is not a recursive mutex the calling thread does not own the mutex.

- <sup>9</sup> *Effects:* Constructs an object of type `unique_lock` and calls `m.try_lock()`.

- <sup>10</sup> *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock()`.

```
unique_lock(mutex_type& m, adopt_lock_t);
```

- <sup>11</sup> *Requires:* The calling thread owns the mutex.

- <sup>12</sup> *Effects:* Constructs an object of type `unique_lock`.

- <sup>13</sup> *Postconditions:* `pm == addressof(m)` and `owns == true`.

- <sup>14</sup> *Throws:* Nothing.

```
template <class Clock, class Duration>
```

```
    unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
```

15     *Requires:* If `mutex_type` is not a recursive mutex the calling thread does not own the mutex. The supplied Mutex type shall meet the `TimedLockable` requirements (30.2.5.4).

16     *Effects:* Constructs an object of type `unique_lock` and calls `m.try_lock_until(abs_time)`.

17     *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_until(abs_time)`.

```
template <class Rep, class Period>
```

```
    unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
```

18     *Requires:* If `mutex_type` is not a recursive mutex the calling thread does not own the mutex. The supplied Mutex type shall meet the `TimedLockable` requirements (30.2.5.4).

19     *Effects:* Constructs an object of type `unique_lock` and calls `m.try_lock_for(rel_time)`.

20     *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_for(rel_time)`.

```
unique_lock(unique_lock&& u) noexcept;
```

21     *Postconditions:* `pm == u.p.pm` and `owns == u.p.owns` (where `u.p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

```
unique_lock& operator=(unique_lock&& u);
```

22     *Effects:* If `owns` calls `pm->unlock()`.

23     *Postconditions:* `pm == u.p.pm` and `owns == u.p.owns` (where `u.p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

24     [*Note:* With a recursive mutex it is possible for both `*this` and `u` to own the same mutex before the assignment. In this case, `*this` will own the mutex after the assignment and `u` will not. — *end note*]

25     *Throws:* Nothing.

```
~unique_lock();
```

26     *Effects:* If `owns` calls `pm->unlock()`.

#### 30.4.2.2.2 unique\_lock locking

[thread.lock.unique.locking]

```
void lock();
```

1     *Effects:* As if by `pm->lock()`.

2     *Postcondition:* `owns == true`

3     *Throws:* Any exception thrown by `pm->lock()`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is 0. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is true.

```
bool try_lock();
```

4     *Requires:* The supplied Mutex shall meet the `Lockable` requirements (30.2.5.3).

5     *Effects:* As if by `pm->try_lock()`.

6     *Returns:* The value returned by the call to `try_lock()`.

7     *Postcondition:* `owns == res`, where `res` is the value returned by the call to `try_lock()`.

8     *Throws:* Any exception thrown by `pm->try_lock()`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is 0. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is true.

```
template <class Clock, class Duration>
```

```
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

9       *Requires:* The supplied Mutex type shall meet the TimedLockable requirements (30.2.5.4).

10       *Effects:* As if by `pm->try_lock_until(abs_time)`.

11       *Returns:* The value returned by the call to `try_lock_until(abs_time)`.

12       *Postcondition:* `owns == res`, where `res` is the value returned by the call to `try_lock_until(abs_time)`.

13       *Throws:* Any exception thrown by `pm->try_lock_until()`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is 0. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is true.

```
template <class Rep, class Period>
```

```
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

14       *Requires:* The supplied Mutex type shall meet the TimedLockable requirements (30.2.5.4).

15       *Effects:* As if by `pm->try_lock_for(rel_time)`.

16       *Returns:* The value returned by the call to `try_lock_for(rel_time)`.

17       *Postcondition:* `owns == res`, where `res` is the value returned by the call to `try_lock_for(rel_time)`.

18       *Throws:* Any exception thrown by `pm->try_lock_for()`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is 0. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is true.

```
void unlock();
```

19       *Effects:* As if by `pm->unlock()`.

20       *Postcondition:* `owns == false`

21       *Throws:* `system_error` when an exception is required (30.2.2).

22       *Error conditions:*

(22.1)       — `operation_not_permitted` — if on entry `owns` is false.

#### 30.4.2.2.3 unique\_lock modifiers

[thread.lock.unique.mod]

```
void swap(unique_lock& u) noexcept;
```

1       *Effects:* Swaps the data members of `*this` and `u`.

```
mutex_type* release() noexcept;
```

2       *Returns:* The previous value of `pm`.

3       *Postconditions:* `pm == 0` and `owns == false`.

```
template <class Mutex>
```

```
    void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

4       *Effects:* As if by `x.swap(y)`.

**30.4.2.2.4 unique\_lock observers**

[thread.lock.unique.obs]

```
bool owns_lock() const noexcept;
```

1     *Returns:* owns

```
explicit operator bool() const noexcept;
```

2     *Returns:* owns

```
mutex_type *mutex() const noexcept;
```

3     *Returns:* pm

**30.4.2.3 Class template shared\_lock**

[thread.lock.shared]

```
namespace std {

template <class Mutex>
class shared_lock {
public:
    typedef Mutex mutex_type;

    // Shared locking
    shared_lock() noexcept;
    explicit shared_lock(mutex_type& m); // blocking
    shared_lock(mutex_type& m, defer_lock_t) noexcept;
    shared_lock(mutex_type& m, try_to_lock_t);
    shared_lock(mutex_type& m, adopt_lock_t);
    template <class Clock, class Duration>
        shared_lock(mutex_type& m,
                    const chrono::time_point<Clock, Duration>& abs_time);
    template <class Rep, class Period>
        shared_lock(mutex_type& m,
                    const chrono::duration<Rep, Period>& rel_time);
    ~shared_lock();

    shared_lock(shared_lock const&) = delete;
    shared_lock& operator=(shared_lock const&) = delete;

    shared_lock(shared_lock&& u) noexcept;
    shared_lock& operator=(shared_lock&& u) noexcept;

    void lock(); // blocking
    bool try_lock();
    template <class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template <class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    // Setters
    void swap(shared_lock& u) noexcept;
    mutex_type* release() noexcept;

    // Getters
    bool owns_lock() const noexcept;
    explicit operator bool () const noexcept;
```

```

    mutex_type* mutex() const noexcept;

private:
    mutex_type* pm; // exposition only
    bool owns;      // exposition only
};

template <class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;

} // std

```

- <sup>1</sup> An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (3.8) of the `shared_lock` object. The supplied `Mutex` type shall meet the shared mutex requirements (30.4.1.5).

- <sup>2</sup> [Note: `shared_lock<Mutex>` meets the `TimedLockable` requirements (30.2.5.4). — end note]

#### 30.4.2.3.1 `shared_lock` constructors, destructor, and assignment [thread.lock.shared.cons]

```
shared_lock() noexcept;
```

- <sup>1</sup> *Effects:* Constructs an object of type `shared_lock`.

- <sup>2</sup> *Postconditions:* `pm == nullptr` and `owns == false`.

```
explicit shared_lock(mutex_type& m);
```

- <sup>3</sup> *Requires:* The calling thread does not own the mutex for any ownership mode.

- <sup>4</sup> *Effects:* Constructs an object of type `shared_lock` and calls `m.lock_shared()`.

- <sup>5</sup> *Postconditions:* `pm == addressof(m)` and `owns == true`.

```
shared_lock(mutex_type& m, defer_lock_t) noexcept;
```

- <sup>6</sup> *Effects:* Constructs an object of type `shared_lock`.

- <sup>7</sup> *Postconditions:* `pm == addressof(m)` and `owns == false`.

```
shared_lock(mutex_type& m, try_to_lock_t);
```

- <sup>8</sup> *Requires:* The calling thread does not own the mutex for any ownership mode.

- <sup>9</sup> *Effects:* Constructs an object of type `shared_lock` and calls `m.try_lock_shared()`.

- <sup>10</sup> *Postconditions:* `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared()`.

```
shared_lock(mutex_type& m, adopt_lock_t);
```

- <sup>11</sup> *Requires:* The calling thread has shared ownership of the mutex.

- <sup>12</sup> *Effects:* Constructs an object of type `shared_lock`.

- <sup>13</sup> *Postconditions:* `pm == addressof(m)` and `owns == true`.

```

template <class Clock, class Duration>
    shared_lock(mutex_type& m,
                const chrono::time_point<Clock, Duration>& abs_time);

```

- 14 *Requires:* The calling thread does not own the mutex for any ownership mode.
- 15 *Effects:* Constructs an object of type `shared_lock` and calls `m.try_lock_shared_until(abs_time)`.
- 16 *Postconditions:* `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_until(abs_time)`.

```
template <class Rep, class Period>
    shared_lock(mutex_type& m,
               const chrono::duration<Rep, Period>& rel_time);
```

- 17 *Requires:* The calling thread does not own the mutex for any ownership mode.
- 18 *Effects:* Constructs an object of type `shared_lock` and calls `m.try_lock_shared_for(rel_time)`.
- 19 *Postconditions:* `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_for(rel_time)`.

```
~shared_lock();
```

- 20 *Effects:* If `owns` calls `pm->unlock_shared()`.

```
shared_lock(shared_lock&& sl) noexcept;
```

- 21 *Postconditions:* `pm == sl_p.pm` and `owns == sl_p.owns` (where `sl_p` is the state of `sl` just prior to this construction), `sl.pm == nullptr` and `sl.owns == false`.

```
shared_lock& operator=(shared_lock&& sl) noexcept;
```

- 22 *Effects:* If `owns` calls `pm->unlock_shared()`.
- 23 *Postconditions:* `pm == sl_p.pm` and `owns == sl_p.owns` (where `sl_p` is the state of `sl` just prior to this assignment), `sl.pm == nullptr` and `sl.owns == false`.

#### 30.4.2.3.2 `shared_lock` locking

[thread.lock.shared.locking]

```
void lock();
```

- 1 *Effects:* As if by `pm->lock_shared()`.
- 2 *Postconditions:* `owns == true`.
- 3 *Throws:* Any exception thrown by `pm->lock_shared()`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is `nullptr`. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is `true`.

```
bool try_lock();
```

- 4 *Effects:* As if by `pm->try_lock_shared()`.
- 5 *Returns:* The value returned by the call to `pm->try_lock_shared()`.
- 6 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared()`.
- 7 *Throws:* Any exception thrown by `pm->try_lock_shared()`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is `nullptr`. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is `true`.

```
template <class Clock, class Duration>
    bool
    try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

- 8 *Effects:* As if by `pm->try_lock_shared_until(abs_time)`.
- 9 *Returns:* The value returned by the call to `pm->try_lock_shared_until(abs_time)`.
- 10 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.
- 11 *Throws:* Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is `nullptr`. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is `true`.

```
template <class Rep, class Period>
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

- 12 *Effects:* As if by `pm->try_lock_shared_for(rel_time)`.
- 13 *Returns:* The value returned by the call to `pm->try_lock_shared_for(rel_time)`.
- 14 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.
- 15 *Throws:* Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` if an exception is required (30.2.2). `system_error` with an error condition of `operation_not_permitted` if `pm` is `nullptr`. `system_error` with an error condition of `resource_deadlock_would_occur` if on entry `owns` is `true`.

```
void unlock();
```

- 16 *Effects:* As if by `pm->unlock_shared()`.
- 17 *Postconditions:* `owns == false`.
- 18 *Throws:* `system_error` when an exception is required (30.2.2).
- 19 *Error conditions:*
- (19.1) — `operation_not_permitted` — if on entry `owns` is `false`.

#### 30.4.2.3.3 shared\_lock modifiers

[thread.lock.shared.mod]

```
void swap(shared_lock& sl) noexcept;
```

- 1 *Effects:* Swaps the data members of `*this` and `sl`.

```
mutex_type* release() noexcept;
```

- 2 *Returns:* The previous value of `pm`.
- 3 *Postconditions:* `pm == nullptr` and `owns == false`.

```
template <class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
```

- 4 *Effects:* As if by `x.swap(y)`.

#### 30.4.2.3.4 shared\_lock observers

[thread.lock.shared.obs]

```
bool owns_lock() const noexcept;
```

- 1 *Returns:* `owns`.

```
explicit operator bool () const noexcept;
```

- 2 *Returns:* `owns`.

```
mutex_type* mutex() const noexcept;
```

3       *Returns:* pm.

### 30.4.3 Generic locking algorithms

[thread.lock.algorithm]

```
template <class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
```

1       *Requires:* Each template parameter type shall meet the `Lockable` requirements. [ *Note:* The `unique_lock` class template meets these requirements when suitably instantiated. — *end note* ]

2       *Effects:* Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` shall be called for all prior arguments and there shall be no further calls to `try_lock()`.

3       *Returns:* -1 if all calls to `try_lock()` returned `true`, otherwise a 0-based index value that indicates the argument for which `try_lock()` returned `false`.

```
template <class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

4       *Requires:* Each template parameter type shall meet the `Lockable` requirements, [ *Note:* The `unique_lock` class template meets these requirements when suitably instantiated. — *end note* ]

5       *Effects:* All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls shall not result in deadlock, but is otherwise unspecified. [ *Note:* A deadlock avoidance algorithm such as try-and-back-off must be used, but the specific algorithm is not specified to avoid over-constraining implementations. — *end note* ] If a call to `lock()` or `try_lock()` throws an exception, `unlock()` shall be called for any argument that had been locked by a call to `lock()` or `try_lock()`.

### 30.4.4 Call once

[thread.once]

The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

#### 30.4.4.1 Struct `once_flag`

[thread.once.onceflag]

```
constexpr once_flag() noexcept;
```

1       *Effects:* Constructs an object of type `once_flag`.

2       *Synchronization:* The construction of a `once_flag` object is not synchronized.

3       *Postcondition:* The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

#### 30.4.4.2 Function `call_once`

[thread.once.callonce]

```
template<class Callable, class ...Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1       *Requires:* `INVOKE( std::forward<Callable>(func), std::forward<Args>(args)...) (20.12.2)` shall be a valid expression.

2       *Effects:* An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution shall call `INVOKE( std::forward<Callable>(func), std::forward<Args>(args)...) (20.12.2)`. If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution shall propagate the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one shall be a returning execution; if there is a returning execution, it shall be the

last active execution; and there are passive executions only if there is a returning execution. [ *Note*: passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — *end note* ]

*Synchronization*: For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (1.10) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

*Throws*: `system_error` when an exception is required (30.2.2), or any exception thrown by `func`.

[ *Example*:

```
// global flag, regular function
void init();
std::once_flag flag;

void f() {
    std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
    void operator()();
};

void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
}

// object flag, member function
class information {
    std::once_flag verified;
    void verifier();
public:
    void verify() { std::call_once(verified, &information::verifier, *this); }
};
```

— *end example*]

### 30.5 Condition variables

[**thread.condition**]

- 1 Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing maximum efficiency on some platforms. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.
- 2 Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.
- 3 The execution of `notify_one` and `notify_all` shall be atomic. The execution of `wait`, `wait_for`, and `wait_until` shall be performed in three atomic parts:
  1. the release of the mutex and entry into the waiting state;
  2. the unblocking of the wait; and
  3. the reacquisition of the lock.

- 4 The implementation shall behave as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the "happens before" order.
- 5 Condition variable construction and destruction need not be synchronized.

### Header `condition_variable` synopsis

```
namespace std {
    class condition_variable;
    class condition_variable_any;

    void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

    enum class cv_status { no_timeout, timeout };
}
```

```
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

- 6 *Requires:* `lk` is locked by the calling thread and either
- (6.1) — no other thread is waiting on `cond`, or
- (6.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- 7 *Effects:* Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification shall be as if:
- ```
    lk.unlock();
    cond.notify_all();
```
- 8 *Synchronization:* The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.
- 9 *Note:* The supplied lock will be held until the thread exits, and care must be taken to ensure that this does not cause deadlock due to lock ordering issues. After calling `notify_all_at_thread_exit` it is recommended that the thread should be exited as soon as possible, and that no blocking or time-consuming tasks are run on that thread.
- 10 *Note:* It is the user's responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`.

#### 30.5.1 Class `condition_variable`

[thread.condition.condvar]

```
namespace std {
    class condition_variable {
    public:

        condition_variable();
        ~condition_variable();

        condition_variable(const condition_variable&) = delete;
        condition_variable& operator=(const condition_variable&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;
```

```

void wait(unique_lock<mutex>& lock);
template <class Predicate>
    void wait(unique_lock<mutex>& lock, Predicate pred);
template <class Clock, class Duration>
    cv_status wait_until(unique_lock<mutex>& lock,
                        const chrono::time_point<Clock, Duration>& abs_time);
template <class Clock, class Duration, class Predicate>
    bool wait_until(unique_lock<mutex>& lock,
                    const chrono::time_point<Clock, Duration>& abs_time,
                    Predicate pred);

template <class Rep, class Period>
    cv_status wait_for(unique_lock<mutex>& lock,
                      const chrono::duration<Rep, Period>& rel_time);
template <class Rep, class Period, class Predicate>
    bool wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time,
                  Predicate pred);

typedef implementation-defined native_handle_type; // See 30.2.3
native_handle_type native_handle();                // See 30.2.3
};
}

```

- 1 The class `condition_variable` shall be a standard-layout class (Clause 9).

```
condition_variable();
```

- 2 *Effects:* Constructs an object of type `condition_variable`.

- 3 *Throws:* `system_error` when an exception is required (30.2.2).

- 4 *Error conditions:*

- (4.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

```
~condition_variable();
```

- 5 *Requires:* There shall be no thread blocked on `*this`. [*Note:* That is, all threads shall have been notified; they may subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait must happen before destruction. The user must take care to ensure that no threads wait on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — end note]

- 6 *Effects:* Destroys the object.

```
void notify_one() noexcept;
```

- 7 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

- 8 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

```
void wait(unique_lock<mutex>& lock);
```

9 *Requires:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

- (9.1) — no other thread is waiting on this `condition_variable` object or
- (9.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

10 *Effects:*

- (10.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (10.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
- (10.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

11 *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]

12 *Postcondition:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

13 *Throws:* Nothing.

```
template <class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);
```

14 *Requires:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

- (14.1) — no other thread is waiting on this `condition_variable` object or
- (14.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

15 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

16 *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]

17 *Postcondition:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

18 *Throws:* Any exception thrown by `pred`.

```
template <class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
                    const chrono::time_point<Clock, Duration>& abs_time);
```

19 *Requires:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

- (19.1) — no other thread is waiting on this `condition_variable` object or
- (19.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

20 *Effects:*

- (20.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (20.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
- (20.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (30.2.4) specified by `abs_time`, or spuriously.
- (20.4) — If the function exits via an exception, `lock.lock()` shall be called prior to exiting the function.

21 *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]

22 *Postcondition:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

23 *Returns:* `cv_status::timeout` if the absolute timeout (30.2.4) specified by `abs_time` expired, otherwise  
`cv_status::no_timeout`.

24 *Throws:* Timeout-related exceptions (30.2.4).

```
template <class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time);
```

25 *Requires:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(25.1) — no other thread is waiting on this `condition_variable` object or

(25.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently  
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

26 *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

27 *Returns:* `cv_status::timeout` if the relative timeout (30.2.4) specified by `rel_time` expired, otherwise  
`cv_status::no_timeout`.

28 *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]

29 *Postcondition:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

30 *Throws:* Timeout-related exceptions (30.2.4).

```
template <class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
               const chrono::time_point<Clock, Duration>& abs_time,
               Predicate pred);
```

31 *Requires:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(31.1) — no other thread is waiting on this `condition_variable` object or

(31.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently  
 waiting (via `wait`, `wait_for`, or `wait_until`) threads.

32 *Effects:* Equivalent to:

```
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
return true;
```

33 *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]

34 *Postcondition:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

35 [ *Note:* The returned value indicates whether the predicate evaluated to `true` regardless of whether the  
 timeout was triggered. — *end note* ]

36 *Throws:* Timeout-related exceptions (30.2.4) or any exception thrown by `pred`.

```
template <class Rep, class Period, class Predicate>
    bool wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time,
                  Predicate pred);
```

- 37     *Requires:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either
- (37.1)     — no other thread is waiting on this `condition_variable` object or
- (37.2)     — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- 38     *Effects:* Equivalent to:
- ```
        return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```
- 39     [ *Note:* There is no blocking if `pred()` is initially `true`, even if the timeout has already expired. — *end note* ]
- 40     *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]
- 41     *Postcondition:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.
- 42     [ *Note:* The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — *end note* ]
- 43     *Throws:* Timeout-related exceptions (30.2.4) or any exception thrown by `pred`.

### 30.5.2 Class `condition_variable_any` [thread.condition.condvarany]

- <sup>1</sup> A `Lock` type shall meet the `BasicLockable` requirements (30.2.5.2). [ *Note:* All of the standard mutex types meet this requirement. If a `Lock` type other than one of the standard mutex types or a `unique_lock` wrapper for a standard mutex type is used with `condition_variable_any`, the user must ensure that any necessary synchronization is in place with respect to the predicate associated with the `condition_variable_any` instance. — *end note* ]

```
namespace std {
    class condition_variable_any {
    public:
        condition_variable_any();
        ~condition_variable_any();

        condition_variable_any(const condition_variable_any&) = delete;
        condition_variable_any& operator=(const condition_variable_any&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;
        template <class Lock>
            void wait(Lock& lock);
        template <class Lock, class Predicate>
            void wait(Lock& lock, Predicate pred);

        template <class Lock, class Clock, class Duration>
            cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
        template <class Lock, class Clock, class Duration, class Predicate>
            bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                           Predicate pred);
        template <class Lock, class Rep, class Period>
            cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

```

        template <class Lock, class Rep, class Period, class Predicate>
        bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time,
            Predicate pred);
    };
}

```

```
condition_variable_any();
```

2     *Effects:* Constructs an object of type `condition_variable_any`.

3     *Throws:* `bad_alloc` or `system_error` when an exception is required (30.2.2).

4     *Error conditions:*

(4.1)     — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

(4.2)     — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

```
~condition_variable_any();
```

5     *Requires:* There shall be no thread blocked on `*this`. [*Note:* That is, all threads shall have been notified; they may subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait must happen before destruction. The user must take care to ensure that no threads wait on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

6     *Effects:* Destroys the object.

```
void notify_one() noexcept;
```

7     *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

8     *Effects:* Unblocks all threads that are blocked waiting for `*this`.

```
template <class Lock>
void wait(Lock& lock);
```

9     *Note:* if any of the `wait` functions exits via an exception, it is unspecified whether the `Lock` is held. One can use a `Lock` type that allows to query that, such as the `unique_lock` wrapper.

10    *Effects:*

(10.1)     — Atomically calls `lock.unlock()` and blocks on `*this`.

(10.2)     — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.

(10.3)     — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

11    *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1). [*Note:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

12    *Postcondition:* `lock` is locked by the calling thread.

13    *Throws:* Nothing.

```
template <class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);
```

14     *Effects:* Equivalent to:

```
    while (!pred())
        wait(lock);
```

```
template <class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

15     *Effects:*

- (15.1)     — Atomically calls `lock.unlock()` and blocks on `*this`.
  - (15.2)     — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
  - (15.3)     — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (30.2.4) specified by `abs_time`, or spuriously.
  - (15.4)     — If the function exits via an exception, `lock.lock()` shall be called prior to exiting the function.
- 16     *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]
- 17     *Postcondition:* `lock` is locked by the calling thread.
- 18     *Returns:* `cv_status::timeout` if the absolute timeout (30.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.
- 19     *Throws:* Timeout-related exceptions (30.2.4).

```
template <class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

20     *Effects:* Equivalent to:

```
    return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

- 21     *Returns:* `cv_status::timeout` if the relative timeout (30.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.
- 22     *Remarks:* If the function fails to meet the postcondition, `std::terminate()` shall be called (15.5.1).  
 [ *Note:* This can happen if the re-locking of the mutex throws an exception. — *end note* ]
- 23     *Postcondition:* `lock` is locked by the calling thread.
- 24     *Throws:* Timeout-related exceptions (30.2.4).

```
template <class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

25     *Effects:* Equivalent to:

```
    while (!pred())
        if (wait_until(lock, abs_time) == cv_status::timeout)
            return pred();
    return true;
```

- 26     [ *Note:* There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — *end note* ]
- 27     [ *Note:* The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — *end note* ]

```
template <class Lock, class Rep, class Period, class Predicate>
    bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

28

*Effects:* Equivalent to:

```
    return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

## 30.6 Futures

[futures]

### 30.6.1 Overview

[futures.overview]

- <sup>1</sup> 30.6 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread. [ *Note:* These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — *end note* ]

#### Header <future> synopsis

```
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    };

    enum class future_status {
        ready,
        timeout,
        deferred
    };

    template <> struct is_error_code_enum<future_errc> : public true_type { };
    error_code make_error_code(future_errc e) noexcept;
    error_condition make_error_condition(future_errc e) noexcept;

    const error_category& future_category() noexcept;

    class future_error;

    template <class R> class promise;
    template <class R> class promise<R&>;
    template <> class promise<void>;

    template <class R>
        void swap(promise<R>& x, promise<R>& y) noexcept;

    template <class R, class Alloc>
        struct uses_allocator<promise<R>, Alloc>;

    template <class R> class future;
    template <class R> class future<R&>;
    template <> class future<void>;
```

```

template <class R> class shared_future;
template <class R> class shared_future<R&&>;
template <> class shared_future<void>;

template <class> class packaged_task;    // undefined
template <class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>;

template <class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

template <class R, class Alloc>
    struct uses_allocator<packaged_task<R>, Alloc>;

template <class F, class... Args>
    future<result_of_t<decay_t<F>(decay_t<Args>...)>>>
    async(F&& f, Args&&... args);
template <class F, class... Args>
    future<result_of_t<decay_t<F>(decay_t<Args>...)>>>
    async(launch_policy, F&& f, Args&&... args);
}

```

- 2 The enum type `launch` is a bitmask type (17.5.2.1.3) with `launch::async` and `launch::deferred` denoting individual bits. [ *Note:* Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule. — *end note* ]
- 3 The enum values of `future_errc` are distinct and not zero.

### 30.6.2 Error handling

[`futures.errors`]

```
const error_category& future_category() noexcept;
```

- 1 *Returns:* A reference to an object of a type derived from class `error_category`.
- 2 The object’s `default_error_condition` and equivalent virtual functions shall behave as specified for the class `error_category`. The object’s `name` virtual function shall return a pointer to the string “future”.

```
error_code make_error_code(future_errc e) noexcept;
```

- 3 *Returns:* `error_code(static_cast<int>(e), future_category())`.

```
error_condition make_error_condition(future_errc e) noexcept;
```

- 4 *Returns:* `error_condition(static_cast<int>(e), future_category())`.

### 30.6.3 Class `future_error`

[`futures.future_error`]

```

namespace std {
    class future_error : public logic_error {
    public:
        future_error(error_code ec);    // exposition only

        const error_code& code() const noexcept;
        const char*      what() const noexcept;
    };
}

```

```
};
}
```

```
const error_code& code() const noexcept;
```

1 *Returns:* The value of `ec` that was passed to the object's constructor.

```
const char* what() const noexcept;
```

2 *Returns:* An NTBS incorporating `code().message()`.

### 30.6.4 Shared state

[**futures.state**]

1 Many of the classes introduced in this sub-clause use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly void) value or an exception. [*Note:* Futures, promises, and tasks defined in this clause reference such shared state. — *end note*]

2 [*Note:* The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`. — *end note*]

3 An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (30.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.

4 An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider. [*Note:* Such as promises or tasks. — *end note*] The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

5 When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

- (5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
- (5.2) — the return object or provider gives up its reference to its shared state; and
- (5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.

6 When an asynchronous provider is said to make its shared state ready, it means:

- (6.1) — first, the provider marks its shared state as ready; and
- (6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

7 When an asynchronous provider is said to abandon its shared state, it means:

- (7.1) — first, if that state is not ready, the provider
  - (7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then
  - (7.1.2) — makes its shared state ready;
- (7.2) — second, the provider releases its shared state.

- <sup>8</sup> A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.
- <sup>9</sup> Calls to functions that successfully set the stored result of a shared state synchronize with (1.10) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (1.10) the successful return from a call to a waiting function on the shared state.
- <sup>10</sup> Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (3.7.2) is sequenced before making that shared state ready.
- <sup>11</sup> Access to the result of the same shared state may conflict (1.10). [ *Note*: this explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (17.6.5.9). For example, concurrent accesses through references returned by `shared_future::get()` (30.6.7) must either use read-only operations or provide additional synchronization. — *end note* ]

### 30.6.5 Class template promise

[`futures.promise`]

```
namespace std {
    template <class R>
    class promise {
    public:
        promise();
        template <class Allocator>
            promise(allocator_arg_t, const Allocator& a);
        promise(promise&& rhs) noexcept;
        promise(const promise& rhs) = delete;
        ~promise();

        // assignment
        promise& operator=(promise&& rhs) noexcept;
        promise& operator=(const promise& rhs) = delete;
        void swap(promise& other) noexcept;

        // retrieving the result
        future<R> get_future();

        // setting the result
        void set_value(see below);
        void set_exception(exception_ptr p);

        // setting the result with deferred notification
        void set_value_at_thread_exit(see below);
        void set_exception_at_thread_exit(exception_ptr p);
    };
    template <class R>
        void swap(promise<R>& x, promise<R>& y) noexcept;
    template <class R, class Alloc>
        struct uses_allocator<promise<R>, Alloc>;
}
```

- <sup>1</sup> The implementation shall provide the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.

- 2 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```
template <class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>
        : true_type { };

```

- 3 *Requires:* `Alloc` shall be an Allocator (17.6.3.5).

```
promise();
template <class Allocator>
    promise(allocator_arg_t, const Allocator& a);

```

- 4 *Effects:* constructs a `promise` object and a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;

```

- 5 *Effects:* constructs a new `promise` object and transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

- 6 *Postcondition:* `rhs` has no shared state.

```
~promise();

```

- 7 *Effects:* Abandons any shared state (30.6.4).

```
promise& operator=(promise&& rhs) noexcept;

```

- 8 *Effects:* Abandons any shared state (30.6.4) and then as if `promise(std::move(rhs)).swap(*this)`.

- 9 *Returns:* `*this`.

```
void swap(promise& other) noexcept;

```

- 10 *Effects:* Exchanges the shared state of `*this` and `other`.

- 11 *Postcondition:* `*this` has the shared state (if any) that `other` had prior to the call to `swap`. `other` has the shared state (if any) that `*this` had prior to the call to `swap`.

```
future<R> get_future();

```

- 12 *Returns:* A `future<R>` object with the same shared state as `*this`.

- 13 *Throws:* `future_error` if `*this` has no shared state or if `get_future` has already been called on a `promise` with the same shared state as `*this`.

- 14 *Error conditions:*

- (14.1) — `future_already_retrieved` if `get_future` has already been called on a `promise` with the same shared state as `*this`.

- (14.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&&>::set_value(R& r);
void promise<void>::set_value();

```

- 15 *Effects:* Atomically stores the value `r` in the shared state and makes that state ready (30.6.4).

- 16 *Throws:*

- (16.1) — **future\_error** if its shared state already has a stored value or exception, or
- (16.2) — for the first version, any exception thrown by the constructor selected to copy an object of **R**, or
- (16.3) — for the second version, any exception thrown by the constructor selected to move an object of **R**.

17 *Error conditions:*

- (17.1) — **promise\_already\_satisfied** if its shared state already has a stored value or exception.
- (17.2) — **no\_state** if **\*this** has no shared state.

```
void set_exception(exception_ptr p);
```

18 *Requires:* **p** is not null.

19 *Effects:* Atomically stores the exception pointer **p** in the shared state and makes that state ready (30.6.4).

20 *Throws:* **future\_error** if its shared state already has a stored value or exception.

21 *Error conditions:*

- (21.1) — **promise\_already\_satisfied** if its shared state already has a stored value or exception.
- (21.2) — **no\_state** if **\*this** has no shared state.

```
void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();
```

22 *Effects:* Stores the value **r** in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

23 *Throws:*

- (23.1) — **future\_error** if its shared state already has a stored value or exception, or
- (23.2) — for the first version, any exception thrown by the constructor selected to copy an object of **R**, or
- (23.3) — for the second version, any exception thrown by the constructor selected to move an object of **R**.

24 *Error conditions:*

- (24.1) — **promise\_already\_satisfied** if its shared state already has a stored value or exception.
- (24.2) — **no\_state** if **\*this** has no shared state.

```
void set_exception_at_thread_exit(exception_ptr p);
```

25 *Requires:* **p** is not null.

26 *Effects:* Stores the exception pointer **p** in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

27 *Throws:* **future\_error** if an error condition occurs.

28 *Error conditions:*

- (28.1) — **promise\_already\_satisfied** if its shared state already has a stored value or exception.
- (28.2) — **no\_state** if **\*this** has no shared state.

```
template <class R>
void swap(promise<R>& x, promise<R>& y);
```

29 *Effects:* As if by **x.swap(y)**.

### 30.6.6 Class template future

[futures.unique\_future]

- 1 The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (30.6.4) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.
- 2 [Note: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`. — end note]
- 3 The effect of calling any member function other than the destructor, the move-assignment operator, or `valid` on a `future` object for which `valid() == false` is undefined. [Note: Implementations are encouraged to detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`. — end note]

```

namespace std {
    template <class R>
    class future {
    public:
        future() noexcept;
        future(future &&) noexcept;
        future(const future& rhs) = delete;
        ~future();
        future& operator=(const future& rhs) = delete;
        future& operator=(future&&) noexcept;
        shared_future<R> share();

        // retrieving the value
        see below get();

        // functions to check state
        bool valid() const noexcept;

        void wait() const;
        template <class Rep, class Period>
            future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
        template <class Clock, class Duration>
            future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}

```

- 4 The implementation shall provide the template `future` and two specializations, `future<R&&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
future() noexcept;
```

- 5 *Effects:* Constructs an *empty* `future` object that does not refer to a shared state.

- 6 *Postcondition:* `valid() == false`.

```
future(future&& rhs) noexcept;
```

- 7 *Effects:* Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

- 8 *Postconditions:*

(8.1) — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

(8.2) — `rhs.valid() == false`.

`~future();`

9 *Effects:*

(9.1) — Releases any shared state (30.6.4);

(9.2) — destroys `*this`.

`future& operator=(future&& rhs) noexcept;`

10 *Effects:*

(10.1) — Releases any shared state (30.6.4).

(10.2) — move assigns the contents of `rhs` to `*this`.

11 *Postconditions:*

(11.1) — `valid()` returns the same value as `rhs.valid()` prior to the assignment.

(11.2) — `rhs.valid() == false`.

`shared_future<R> share();`

12 *Returns:* `shared_future<R>(std::move(*this))`.

13 *Postcondition:* `valid() == false`.

`R future::get();`  
`R& future<R&>::get();`  
`void future<void>::get();`

14 *Note:* as described above, the template and its two required specializations differ only in the return type and return value of the member function `get`.

15 *Effects:* `wait()`s until the shared state is ready, then retrieves the value stored in the shared state.

16 *Returns:*

(16.1) — `future::get()` returns the value `v` stored in the object's shared state as `std::move(v)`.

(16.2) — `future<R&>::get()` returns the reference stored as value in the object's shared state.

(16.3) — `future<void>::get()` returns nothing.

17 *Throws:* the stored exception, if an exception was stored in the shared state.

18 *Postcondition:* `valid() == false`.

`bool valid() const noexcept;`

19 *Returns:* `true` only if `*this` refers to a shared state.

`void wait() const;`

20 *Effects:* Blocks until the shared state is ready.

`template <class Rep, class Period>`  
`future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;`

21 *Effects:* None if the shared state contains a deferred function (30.6.8), otherwise blocks until the shared state is ready or until the relative timeout (30.2.4) specified by `rel_time` has expired.

22 *Returns:*

(22.1) — `future_status::deferred` if the shared state contains a deferred function.

(22.2) — `future_status::ready` if the shared state is ready.

(22.3) — `future_status::timeout` if the function is returning because the relative timeout (30.2.4) specified by `rel_time` has expired.

23 *Throws:* timeout-related exceptions (30.2.4).

```
template <class Clock, class Duration>
    future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

24 *Effects:* None if the shared state contains a deferred function (30.6.8), otherwise blocks until the shared state is ready or until the absolute timeout (30.2.4) specified by `abs_time` has expired.

25 *Returns:*

(25.1) — `future_status::deferred` if the shared state contains a deferred function.

(25.2) — `future_status::ready` if the shared state is ready.

(25.3) — `future_status::timeout` if the function is returning because the absolute timeout (30.2.4) specified by `abs_time` has expired.

26 *Throws:* timeout-related exceptions (30.2.4).

### 30.6.7 Class template `shared_future` [`futures.shared_future`]

1 The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (30.6.4) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

2 [ *Note:* Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — *end note* ]

3 The effect of calling any member function other than the destructor, the move-assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined. [ *Note:* Implementations are encouraged to detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`. — *end note* ]

```
namespace std {
    template <class R>
    class shared_future {
    public:
        shared_future() noexcept;
        shared_future(const shared_future& rhs);
        shared_future(future<R>&&) noexcept;
        shared_future(shared_future&& rhs) noexcept;
        ~shared_future();
        shared_future& operator=(const shared_future& rhs);
        shared_future& operator=(shared_future&& rhs) noexcept;

        // retrieving the value
        see below get() const;
```

```

    // functions to check state
    bool valid() const noexcept;

    void wait() const;
    template <class Rep, class Period>
        future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
    template <class Clock, class Duration>
        future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
};
}

```

- 4 The implementation shall provide the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
shared_future() noexcept;
```

- 5 *Effects:* Constructs an *empty* `shared_future` object that does not refer to a shared state.

- 6 *Postcondition:* `valid() == false`.

```
shared_future(const shared_future& rhs);
```

- 7 *Effects:* Constructs a `shared_future` object that refers to the same shared state as `rhs` (if any).

- 8 *Postcondition:* `valid()` returns the same value as `rhs.valid()`.

```
shared_future(future<R>&& rhs) noexcept;
```

```
shared_future(shared_future&& rhs) noexcept;
```

- 9 *Effects:* Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

- 10 *Postconditions:*

- (10.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

- (10.2) — `rhs.valid() == false`.

```
~shared_future();
```

- 11 *Effects:*

- (11.1) — Releases any shared state (30.6.4);

- (11.2) — destroys `*this`.

```
shared_future& operator=(shared_future&& rhs) noexcept;
```

- 12 *Effects:*

- (12.1) — Releases any shared state (30.6.4);

- (12.2) — move assigns the contents of `rhs` to `*this`.

- 13 *Postconditions:*

- (13.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the assignment.

- (13.2) — `rhs.valid() == false`.

```
shared_future& operator=(const shared_future& rhs);
```

14 *Effects:*

- (14.1) — Releases any shared state (30.6.4);
- (14.2) — assigns the contents of `rhs` to `*this`. [ *Note:* As a result, `*this` refers to the same shared state as `rhs` (if any). — *end note* ]

15 *Postconditions:* `valid() == rhs.valid()`.

```
const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;
```

16 *Note:* as described above, the template and its two required specializations differ only in the return type and return value of the member function `get`.

17 *Note:* access to a value object stored in the shared state is unsynchronized, so programmers should apply only those operations on `R` that do not introduce a data race (1.10).

18 *Effects:* `wait()`s until the shared state is ready, then retrieves the value stored in the shared state.

19 *Returns:*

- (19.1) — `shared_future::get()` returns a `const` reference to the value stored in the object's shared state. [ *Note:* Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the `shared_future` object that returned the reference. — *end note* ]
- (19.2) — `shared_future<R&>::get()` returns the reference stored as value in the object's shared state.
- (19.3) — `shared_future<void>::get()` returns nothing.

20 *Throws:* the stored exception, if an exception was stored in the shared state.

```
bool valid() const noexcept;
```

21 *Returns:* `true` only if `*this` refers to a shared state.

```
void wait() const;
```

22 *Effects:* Blocks until the shared state is ready.

```
template <class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

23 *Effects:* None if the shared state contains a deferred function (30.6.8), otherwise blocks until the shared state is ready or until the relative timeout (30.2.4) specified by `rel_time` has expired.

24 *Returns:*

- (24.1) — `future_status::deferred` if the shared state contains a deferred function.
- (24.2) — `future_status::ready` if the shared state is ready.
- (24.3) — `future_status::timeout` if the function is returning because the relative timeout (30.2.4) specified by `rel_time` has expired.

25 *Throws:* timeout-related exceptions (30.2.4).

```
template <class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

26 *Effects:* None if the shared state contains a deferred function (30.6.8), otherwise blocks until the shared state is ready or until the absolute timeout (30.2.4) specified by `abs_time` has expired.

27 *Returns:*

- (27.1) — `future_status::deferred` if the shared state contains a deferred function.
  - (27.2) — `future_status::ready` if the shared state is ready.
  - (27.3) — `future_status::timeout` if the function is returning because the absolute timeout (30.2.4) specified by `abs_time` has expired.
- 28 *Throws:* timeout-related exceptions (30.2.4).

### 30.6.8 Function template `async` [futures.async]

- 1 The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```
template <class F, class... Args>
    future<result_of_t<decay_t<F>(decay_t<Args>...)>> async(F&& f, Args&&... args);
template <class F, class... Args>
    future<result_of_t<decay_t<F>(decay_t<Args>...)>> async(launch policy, F&& f, Args&&... args);
```

- 2 *Requires:* F and each Ti in Args shall satisfy the MoveConstructible requirements. *INVOKE*(*DECAY\_COPY*(`std::forward<F>(f)`), *DECAY\_COPY*(`std::forward<Args>(args)`)...) (20.12.2, 30.3.1.2) shall be a valid expression.
- 3 *Effects:* The first function behaves the same as a call to the second function with a `policy` argument of `launch::async` | `launch::deferred` and the same arguments for F and Args. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):
- (3.1) — if `policy & launch::async` is non-zero — calls *INVOKE*(*DECAY\_COPY*(`std::forward<F>(f)`), *DECAY\_COPY*(`std::forward<Args>(args)`)...) (20.12.2, 30.3.1.2) as if in a new thread of execution represented by a `thread` object with the calls to *DECAY\_COPY*() being evaluated in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of *INVOKE*(*DECAY\_COPY*(`std::forward<F>(f)`), *DECAY\_COPY*(`std::forward<Args>(args)`)...) is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.
  - (3.2) — if `policy & launch::deferred` is non-zero — Stores *DECAY\_COPY*(`std::forward<F>(f)`) and *DECAY\_COPY*(`std::forward<Args>(args)`)... in the shared state. These copies of f and args constitute a *deferred function*. Invocation of the deferred function evaluates *INVOKE*(`std::move(g)`, `std::move(xyz)`) where g is the stored value of *DECAY\_COPY*(`std::forward<F>(f)`) and xyz is the stored copy of *DECAY\_COPY*(`std::forward<Args>(args)`)... Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (30.6.4) on an asynchronous return object referring to this shared state shall invoke the deferred function in the thread that called the waiting function. Once evaluation of *INVOKE*(`std::move(g)`, `std::move(xyz)`) begins, the function is no longer considered deferred. [ *Note:* If this policy is specified together with other policies, such as when using a `policy` value of `launch::async` | `launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited. — *end note* ]
  - (3.3) — If no value is set in the launch policy, or a value is set that is neither specified in this International Standard or by the implementation, the behavior is undefined.
- 4 *Returns:* An object of type `future<result_of_t<decay_t<F>(decay_t<Args>...)>>` that refers to the shared state created by this call to `async`. [ *Note:* If a future obtained from `std::async` is moved

outside the local scope, other code that uses the future must be aware that the future's destructor may block for the shared state to become ready. — *end note*]

- 5 *Synchronization:* Regardless of the provided `policy` argument,
- (5.1) — the invocation of `async` synchronizes with (1.10) the invocation of `f`. [*Note:* This statement applies even when the corresponding `future` object is moved to another thread. — *end note*]; and
- (5.2) — the completion of the function `f` is sequenced before (1.10) the shared state is made ready. [*Note:* `f` might not be called at all, so its completion might never happen. — *end note*]

If the implementation chooses the `launch::async` policy,

- (5.3) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (30.3.1.5);
- (5.4) — the associated thread completion synchronizes with (1.10) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

6 *Throws:* `system_error` if `policy == launch::async` and the implementation is unable to start a new thread.

7 *Error conditions:*

- (7.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

8 [*Example:*

```
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async([=]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get();    // #1
}
```

[*Note:* Line #1 might not result in concurrency because the `async` call uses the default policy, which may use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — *end note*] — *end example*]

### 30.6.9 Class template `packaged_task`

[`futures.task`]

- 1 The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.
- 2 When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
    template<class> class packaged_task; // undefined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)> {
    public:
        // construction and destruction
        packaged_task() noexcept;
        template <class F>
```

```

    explicit packaged_task(F&& f);
template <class F, class Allocator>
    packaged_task(allocator_arg_t, const Allocator& a, F&& f);
~packaged_task();

// no copy
packaged_task(const packaged_task&) = delete;
packaged_task& operator=(const packaged_task&) = delete;

// move support
packaged_task(packaged_task&& rhs) noexcept;
packaged_task& operator=(packaged_task&& rhs) noexcept;
void swap(packaged_task& other) noexcept;

bool valid() const noexcept;

// result retrieval
future<R> get_future();

// execution
void operator()(ArgTypes... );
void make_ready_at_thread_exit(ArgTypes...);

void reset();
};
template <class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
template <class R, class Alloc>
    struct uses_allocator<packaged_task<R>, Alloc>;
}

```

### 30.6.9.1 packaged\_task member functions

[futures.task.members]

packaged\_task() noexcept;

- 1 *Effects:* Constructs a packaged\_task object with no shared state and no stored task.

```

template <class F>
    packaged_task(F&& f);
template <class F, class Allocator>
    packaged_task(allocator_arg_t, const Allocator& a, F&& f);

```

- 2 *Requires:* *INVOKE*(f, t1, t2, ..., tN, R), where t1, t2, ..., tN are values of the corresponding types in ArgTypes..., shall be a valid expression. Invoking a copy of f shall behave the same as invoking f.
- 3 *Remarks:* These constructors shall not participate in overload resolution if decay\_t<F> is the same type as std::packaged\_task<R(ArgTypes...)>.
- 4 *Effects:* Constructs a new packaged\_task object with a shared state and initializes the object's stored task with std::forward<F>(f). The constructors that take an Allocator argument use it to allocate memory needed to store the internal data structures.
- 5 *Throws:* any exceptions thrown by the copy or move constructor of f, or std::bad\_alloc if memory for the internal data structures could not be allocated.

packaged\_task(packaged\_task&& rhs) noexcept;

6       *Effects:* Constructs a new `packaged_task` object and transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

7       *Postcondition:* `rhs` has no shared state.

```
packaged_task& operator=(packaged_task&& rhs) noexcept;
```

8       *Effects:*

(8.1)       — Releases any shared state (30.6.4);

(8.2)       — calls `packaged_task(std::move(rhs)).swap(*this)`.

```
~packaged_task();
```

9       *Effects:* Abandons any shared state (30.6.4).

```
void swap(packaged_task& other) noexcept;
```

10       *Effects:* Exchanges the shared states and stored tasks of `*this` and `other`.

11       *Postcondition:* `*this` has the same shared state and stored task (if any) as `other` prior to the call to `swap`. `other` has the same shared state and stored task (if any) as `*this` prior to the call to `swap`.

```
bool valid() const noexcept;
```

12       *Returns:* `true` only if `*this` has a shared state.

```
future<R> get_future();
```

13       *Returns:* A `future` object that shares the same shared state as `*this`.

14       *Throws:* a `future_error` object if an error occurs.

15       *Error conditions:*

(15.1)       — `future_already_retrieved` if `get_future` has already been called on a `packaged_task` object with the same shared state as `*this`.

(15.2)       — `no_state` if `*this` has no shared state.

```
void operator()(ArgTypes... args);
```

16       *Effects:* As if by `INVOKE(f, t1, t2, ..., tN, R)`, where `f` is the stored task of `*this` and `t1, t2, ..., tN` are the values in `args...`. If the task returns normally, the return value is stored as the asynchronous result in the shared state of `*this`, otherwise the exception thrown by the task is stored. The shared state of `*this` is made ready, and any threads blocked in a function waiting for the shared state of `*this` to become ready are unblocked.

17       *Throws:* a `future_error` exception object if there is no shared state or the stored task has already been invoked.

18       *Error conditions:*

(18.1)       — `promise_already_satisfied` if the stored task has already been invoked.

(18.2)       — `no_state` if `*this` has no shared state.

```
void make_ready_at_thread_exit(ArgTypes... args);
```

19 *Effects:* As if by *INVOKE*(*f*, *t1*, *t2*, ..., *tN*, *R*), where *f* is the stored task and *t1*, *t2*, ..., *tN* are the values in *args*.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *\*this*, otherwise the exception thrown by the task is stored. In either case, this shall be done without making that state ready (30.6.4) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

20 *Throws:* *future\_error* if an error condition occurs.

21 *Error conditions:*

(21.1) — *promise\_already\_satisfied* if the stored task has already been invoked.

(21.2) — *no\_state* if *\*this* has no shared state.

`void reset();`

22 *Effects:* As if *\*this* = *packaged\_task*(*std::move*(*f*)), where *f* is the task stored in *\*this*. [ *Note:* This constructs a new shared state for *\*this*. The old state is abandoned (30.6.4). — *end note* ]

23 *Throws:*

(23.1) — *bad\_alloc* if memory for the new shared state could not be allocated.

(23.2) — any exception thrown by the move constructor of the task stored in the shared state.

(23.3) — *future\_error* with an error condition of *no\_state* if *\*this* has no shared state.

### 30.6.9.2 *packaged\_task* globals

[*futures.task.nonmembers*]

```
template <class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
```

1 *Effects:* As if by *x.swap*(*y*).

```
template <class R, class Alloc>
    struct uses_allocator<packaged_task<R>, Alloc>
        : true_type { };
```

2 *Requires:* *Alloc* shall be an Allocator (17.6.3.5).

# Annex A (informative)

## Grammar summary

[gram]

- <sup>1</sup> This summary of C++ syntax is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (6.8, 7.1, 10.2) must be applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules must be used to weed out syntactically valid but meaningless constructs.

### A.1 Keywords

[gram.key]

- <sup>1</sup> New context-dependent keywords are introduced into a program by `typedef` (7.1.3), `namespace` (7.3.1), `class` (Clause 9), `enumeration` (7.2), and `template` (Clause 14) declarations.

```

typedef-name:
    identifier
namespace-name:
    identifier
    namespace-alias
namespace-alias:
    identifier
class-name:
    identifier
    simple-template-id
enum-name:
    identifier
template-name:
    identifier

```

Note that a *typedef-name* naming a class is also a *class-name* (9.1).

### A.2 Lexical conventions

[gram.lex]

```

hex-quad:
    hexadecimal-digit hexadecimal-digit hexadecimal-digit hexadecimal-digit
universal-character-name:
    \u hex-quad
    \U hex-quad hex-quad
preprocessing-token:
    header-name
    identifier
    pp-number
    character-literal
    user-defined-character-literal
    string-literal
    user-defined-string-literal
    preprocessing-op-or-punc
    each non-white-space character that cannot be one of the above

```

*token:*

- identifier*
- keyword*
- literal*
- operator*
- punctuator*

*header-name:*

- < h-char-sequence >*
- " q-char-sequence "*

# Annex B (informative)

## Implementation quantities [implimits]

<sup>1</sup> Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.

<sup>2</sup> The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.

- (2.1) — Nesting levels of compound statements, iteration control structures, and selection control structures [256].
- (2.2) — Nesting levels of conditional inclusion [256].
- (2.3) — Pointer, array, and function declarators (in any combination) modifying a class, arithmetic, or incomplete type in a declaration [256].
- (2.4) — Nesting levels of parenthesized expressions within a full-expression [256].
- (2.5) — Number of characters in an internal identifier or macro name [1 024].
- (2.6) — Number of characters in an external identifier [1 024].
- (2.7) — External identifiers in one translation unit [65 536].
- (2.8) — Identifiers with block scope declared in one block [1 024].
- (2.9) — Macro identifiers simultaneously defined in one translation unit [65 536].
- (2.10) — Parameters in one function definition [256].
- (2.11) — Arguments in one function call [256].
- (2.12) — Parameters in one macro definition [256].
- (2.13) — Arguments in one macro invocation [256].
- (2.14) — Characters in one logical source line [65 536].
- (2.15) — Characters in a string literal (after concatenation) [65 536].
- (2.16) — Size of an object [262 144].
- (2.17) — Nesting levels for `#include` files [256].
- (2.18) — Case labels for a `switch` statement (excluding those for any nested `switch` statements) [16 384].
- (2.19) — Data members in a single class [16 384].
- (2.20) — Enumeration constants in a single enumeration [4 096].

- (2.21) — Levels of nested class definitions in a single *member-specification* [256].
- (2.22) — Functions registered by `atexit()` [32].
- (2.23) — Functions registered by `at_quick_exit()` [32].
- (2.24) — Direct and indirect base classes [16 384].
- (2.25) — Direct base classes for a single class [1 024].
- (2.26) — Members declared in a single class [4 096].
- (2.27) — Final overriding virtual functions in a class, accessible or not [16 384].
- (2.28) — Direct and indirect virtual bases of a class [1 024].
- (2.29) — Static members of a class [1 024].
- (2.30) — Friend declarations in a class [4 096].
- (2.31) — Access control declarations in a class [4 096].
- (2.32) — Member initializers in a constructor definition [6 144].
- (2.33) — Scope qualifications of one identifier [256].
- (2.34) — Nested external specifications [1 024].
- (2.35) — Recursive `constexpr` function invocations [512].
- (2.36) — Full-expressions evaluated within a core constant expression [1 048 576].
- (2.37) — Template arguments in a template declaration [1 024].
- (2.38) — Recursively nested template instantiations, including substitution during template argument deduction ([14.8.2](#)) [1 024].
- (2.39) — Handlers per `try` block [256].
- (2.40) — Throw specifications on a single function declaration [256].
- (2.41) — Number of placeholders ([20.12.10.4](#)) [10].

# Annex C (informative)

## Compatibility

[diff]

### C.1 C++ and ISO C

[diff.iso]

- <sup>1</sup> This subclause lists the differences between C++ and ISO C, by the chapters of this document.

#### C.1.1 Clause 2: lexical conventions

[diff.lex]

##### 2.11

**Change:** New Keywords

New keywords are added to C++; see 2.11.

**Rationale:** These keywords were added in order to implement the new semantics of C++.

**Effect on original feature:** Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.

**Difficulty of converting:** Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.

**How widely used:** Common.

##### 2.13.3

**Change:** Type of character literal is changed from `int` to `char`

**Rationale:** This is needed for improved overloaded function argument type matching. For example:

```
int function( int i );
int function( char c );

function( 'x' );
```

It is preferable that this call match the second version of function rather than the first.

**Effect on original feature:** Change to semantics of well-defined feature. ISO C programs which depend on

```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.

**Difficulty of converting:** Simple.

**How widely used:** Programs which depend upon `sizeof('x')` are probably rare.

Subclause 2.13.5:

**Change:** String literals made `const`

The type of a string literal is changed from “array of `char`” to “array of `const char`”. The type of a `char16_t` string literal is changed from “array of *some-integer-type*” to “array of `const char16_t`”. The type of a `char32_t` string literal is changed from “array of *some-integer-type*” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.

**Rationale:** This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Syntactic transformation. The fix is to add a cast:

```
char* p = "abc";                // valid in C, invalid in C++
void f(char*) {
    char* p = (char*)"abc";      // OK: cast added
    f(p);
```

```
f((char*)"def");           // OK: cast added
}
```

**How widely used:** Programs that have a legitimate reason to treat string literals as pointers to potentially modifiable memory are probably rare.

### C.1.2 Clause 3: basic concepts

[diff.basic]

#### 3.1

**Change:** C++ does not have “tentative definitions” as in C E.g., at file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local static objects, if initializers are restricted to the syntactic forms of C. For example,

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

**Rationale:** This avoids having different initialization rules for fundamental types and user-defined types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**Rationale:** In C++, the initializer for one of a set of mutually-referential file-local static objects must invoke a function call to achieve the initialization.

**How widely used:** Seldom.

#### 3.3

**Change:** A **struct** is a scope in C++, not in C

**Rationale:** Class scope is crucial to C++, and a **struct** is a class.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** C programs use **struct** extremely frequently, but the change is only noticeable when **struct**, enumeration, or enumerator names are referred to outside the **struct**. The latter is probably rare.

#### 3.5 [also 7.1.6]

**Change:** A name of file scope that is explicitly declared **const**, and not explicitly declared **extern**, has internal linkage, while in C it would have external linkage

**Rationale:** Because **const** objects can be used as compile-time values in C++, this feature urges programmers to provide explicit initializer values for each **const**. This feature allows the user to put **const** objects in header files that are included in many compilation units.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation

**How widely used:** Seldom

#### 3.6

**Change:** Main cannot be called recursively and cannot have its address taken

**Rationale:** The main function may require special actions.

**Effect on original feature:** Deletion of semantically well-defined feature

**Difficulty of converting:** Trivial: create an intermediary function such as `mymain(argc, argv)`.

**How widely used:** Seldom

## 3.9

**Change:** C allows “compatible types” in several places, C++ does not. For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

**Rationale:** Stricter type checking is essential for C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this International Standard.

**How widely used:** Common.

## C.1.3 Clause 4: standard conversions

[diff.conv]

## 4.10

**Change:** Converting `void*` to a pointer-to-object type requires casting

```
char a[10];
void* b=a;
void foo() {
    char* c=b;
}
```

ISO C will accept this usage of pointer to void being assigned to a pointer to object type. C++ will not.

**Rationale:** C++ tries harder than C to enforce compile-time type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Could be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```
char* c = (char*) b;
```

**How widely used:** This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

## C.1.4 Clause 5: expressions

[diff.expr]

## 5.2.2

**Change:** Implicit declaration of functions is not allowed

**Rationale:** The type-safe nature of C++.

**Effect on original feature:** Deletion of semantically well-defined feature. Note: the original feature was labeled as “obsolescent” in ISO C.

**Difficulty of converting:** Syntactic transformation. Facilities for producing explicit function declarations are fairly widespread commercially.

**How widely used:** Common.

## 5.3.3, 5.4

**Change:** Types must be defined in declarations, not in expressions

In C, a `sizeof` expression or cast expression may define a new type. For example,

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, `struct x`.

**Rationale:** This prohibition helps to clarify the location of definitions in the source code.

**Effect on original feature:** Deletion of a semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

5.16, 5.18, 5.19

**Change:** The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue

**Rationale:** C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, functions may return lvalues.

**Effect on original feature:** Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C.

**Difficulty of converting:** Programs must add explicit casts to the appropriate rvalue.

**How widely used:** Rare.

### C.1.5 Clause 6: statements

[diff.stat]

6.4.2, 6.6.4

**Change:** It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered)

**Rationale:** Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated run-time determination of allocation. Furthermore, any use of the uninitialized object could be a disaster. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

6.6.3

**Change:** It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value

**Rationale:** The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between void functions and int functions.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Add an appropriate return value to the source code, such as zero.

**How widely used:** Seldom. For several years, many existing C implementations have produced warnings in this case.

### C.1.6 Clause 7: declarations

[diff.dcl]

7.1.1

**Change:** In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:

```
static struct S {                // valid C, invalid in C++
    int i;
};
```

**Rationale:** Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Allowing storage class specifiers on type declarations could render the code confusing for users.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

### 7.1.1

**Change:** In C++, `register` is not a storage class specifier.

**Rationale:** The storage class specifier had no effect in C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common.

### 7.1.3

**Change:** A C++ typedef name must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a typedef name and a struct tag name declared in the same scope can have the same name (because they have different name spaces)

Example:

```
typedef struct name1 { /*...*/ } name1;          // valid C and C++
struct name { /*...*/ };
typedef int name;                                // valid C, invalid C++
```

**Rationale:** For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

Example:

```
class name { /*...*/ };
name i;                                           // i has type class name
```

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. One of the 2 types has to be renamed.

**How widely used:** Seldom.

### 7.1.6 [see also 3.5]

**Change:** `const` objects must be initialized in C++ but can be left uninitialized in C

**Rationale:** A `const` object cannot be assigned to so it must be initialized to hold a useful value.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

### 7.1.6

**Change:** Banning implicit `int`

In C++ a *decl-specifier-seq* must contain a *type-specifier*, unless it is followed by a declarator for a constructor, a destructor, or a conversion function. In the following example, the left-hand column presents valid C; the right-hand column presents equivalent C++:

|                                  |                                      |
|----------------------------------|--------------------------------------|
| <code>void f(const parm);</code> | <code>void f(const int parm);</code> |
| <code>const n = 3;</code>        | <code>const int n = 3;</code>        |
| <code>main()</code>              | <code>int main()</code>              |
| <code>/* ... */</code>           | <code>/* ... */</code>               |

**Rationale:** In C++, implicit int creates several opportunities for ambiguity between expressions involving function-like casts and declarations. Explicit declaration is increasingly considered to be proper style. Liaison with WG14 (C) indicated support for (at least) deprecating implicit int in the next revision of C.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation. Could be automated.

**How widely used:** Common.

#### 7.1.6.4

**Change:** The keyword `auto` cannot be used as a storage class specifier.

```
void f() {
    auto int x;    // valid C, invalid C++
}
```

**Rationale:** Allowing the use of `auto` to deduce the type of a variable from its initializer results in undesired interpretations of `auto` as a storage class specifier in certain contexts.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Rare.

#### 7.2

**Change:** C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type

Example:

```
enum color { red, blue, green };
enum color c = 1;    // valid C, invalid C++
```

**Rationale:** The type-safe nature of C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

**How widely used:** Common.

#### 7.2

**Change:** In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is `int`.

Example:

```
enum e { A };
sizeof(A) == sizeof(int)    // in C
sizeof(A) == sizeof(e)     // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

**Rationale:** In C++, an enumeration is a distinct type.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

**C.1.7 Clause 8: declarators****[diff.decl]****8.3.5**

**Change:** In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

```
int f();           // means int f(void) in C++
                  // int f( unknown ) in C
```

**Rationale:** This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).

**Effect on original feature:** Change to semantics of well-defined feature. This feature was marked as “obsolescent” in C.

**Difficulty of converting:** Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.

**How widely used:** Common.

**8.3.5** [see 5.3.3]

**Change:** In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed

Example:

```
void f( struct S { int a; } arg ) {}    // valid C, invalid C++
enum E { A, B, C } f() {}              // valid C, invalid C++
```

**Rationale:** When comparing types in different compilation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in an parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The type definitions must be moved to file scope, or in header files.

**How widely used:** Seldom. This style of type definitions is seen as poor coding style.

**8.4**

**Change:** In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent.”

**Rationale:** Prototypes are essential to type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common in old programs, but already known to be obsolescent.

**8.5.2**

**Change:** In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating ‘\0’) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating ‘\0’

Example:

```
char array[4] = "abcd";                // valid C, invalid C++
```

**Rationale:** When these non-terminated arrays are manipulated by standard string routines, there is potential for major catastrophe.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The arrays must be declared one element bigger to contain the string terminating `'\0'`.

**How widely used:** Seldom. This style of array initialization is seen as poor coding style.

### C.1.8 Clause 9: classes

[diff.class]

9.1 [see also 7.1.3]

**Change:** In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope

Example:

```
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}
```

**Rationale:** This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

**How widely used:** Seldom.

#### 9.2.4

**Change:** Bit-fields of type plain `int` are signed.

**Rationale:** Leaving the choice of signedness to implementations could lead to inconsistent definitions of template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

**Effect on original feature:** The choice is implementation-defined in C, but not so in C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

#### 9.2.5

**Change:** In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

Example:

```
struct X {
    struct Y { /* ... */ } y;
};
```

```
struct Y yy;                      // valid C, invalid C++
```

**Rationale:** C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

**Effect on original feature:** Change of semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag could be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:

```
struct Y;                          // struct Y and struct X are at the same scope
struct X {
    struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct could be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 3.3.

**How widely used:** Seldom.

#### 9.2.6

**Change:** In C++, a typedef name may not be redeclared in a class definition after being used in that definition

Example:

```
typedef int I;
struct S {
    I i;
    int I;                      // valid C, invalid C++
};
```

**Rationale:** When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of 'I' really is.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Either the type or the struct member has to be renamed.

**How widely used:** Seldom.

### C.1.9 Clause 12: special member functions

[diff.special]

#### 12.8

**Change:** Copying volatile objects

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:

```
struct X { int i; };
volatile struct X x1 = {0};
struct X x2(x1);                // invalid C++
struct X x3;
x3 = x1;                        // also invalid C++
```

**Rationale:** Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. [ *Note:* This user-declared constructor may be explicitly defaulted. — *end note* ] If non-volatile semantics are required, an explicit `const_cast` can be used.

**How widely used:** Seldom.

### C.1.10 Clause 16: preprocessing directives

[diff.cpp]

#### 16.8

**Change:** Whether `__STDC__` is defined and if so, what its value is, are implementation-defined

**Rationale:** C++ is not identical to ISO C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim. Each implementation must choose the behavior that will be most useful to its marketplace.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Programs and headers that reference `__STDC__` are quite common.

### C.2 C++ and ISO C++ 2003

[diff.cpp03]

- <sup>1</sup> This subclause lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, *Programming Language — C++*), by the chapters of this document.

#### C.2.1 Clause 2: lexical conventions

[diff.cpp03.lex]

##### 2.4

**Change:** New kinds of string literals

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this International Standard. Specifically, macros named `R`, `u8`, `u8R`, `u`, `uR`, `U`, `UR`, or `LR` will not be expanded when adjacent to a string literal but will be interpreted as part of the string literal. For example,

```
#define u8 "abc"
const char* s = u8"def";           // Previously "abcdef", now "def"
```

##### 2.4

**Change:** User-defined literal string support

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this International Standard, as the following example illustrates.

```
#define _x "there"
"hello"_x           // #1
```

Previously, `#1` would have consisted of two separate preprocessing tokens and the macro `_x` would have been expanded. In this International Standard, `#1` consists of a single preprocessing tokens, so the macro is not expanded.

##### 2.11

**Change:** New keywords

**Rationale:** Required for new features.

**Effect on original feature:** Added to Table 3, the following identifiers are new keywords: `alignas`, `alignof`, `char16_t`, `char32_t`, `constexpr`, `decltype`, `noexcept`, `nullptr`, `static_assert`, and `thread_local`. Valid C++ 2003 code using these identifiers is invalid in this International Standard.

### 2.13.2

**Change:** Type of integer literals

**Rationale:** C99 compatibility.

**Effect on original feature:** Certain integer literals larger than can be represented by `long` could change from an unsigned integer type to `signed long long`.

## C.2.2 Clause 4: standard conversions

[diff.cpp03.conv]

### 4.10

**Change:** Only literals are integer null pointer constants

**Rationale:** Removing surprising interactions with templates and constant expressions

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this International Standard, as the following example illustrates:

```
void f(void *); // #1
void f(...);   // #2
template<int N> void g() {
    f(0*N);     // calls #2; used to call #1
}
```

## C.2.3 Clause 5: expressions

[diff.cpp03.expr]

### 5.6

**Change:** Specify rounding for results of integer `/` and `%`

**Rationale:** Increase portability, C99 compatibility.

**Effect on original feature:** Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this International Standard always rounds the result toward 0.

### 5.14

**Change:** `&&` is valid in a *type-name*

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this International Standard, as the following example illustrates:

```
bool b1 = new int && false; // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false; // previously false, now ill-formed
```

## C.2.4 Clause 7: declarations

[diff.cpp03.dcl.dcl]

### 7.1

**Change:** Remove `auto` as a storage class specifier

**Rationale:** New feature.

**Effect on original feature:** Valid C++ 2003 code that uses the keyword `auto` as a storage class specifier may be invalid in this International Standard. In this International Standard, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

## C.2.5 Clause 8: declarators

[diff.cpp03.dcl.decl]

### 8.5.4

**Change:** Narrowing restrictions in aggregate initializers

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2003 code may fail to compile in this International Standard. For example, the following code is valid in C++ 2003 but invalid in this International Standard because `double` to `int` is a narrowing conversion:

```
int x[] = { 2.0 };
```

## C.2.6 Clause 12: special member functions

[diff.cpp03.special]

12.1, 12.4, 12.8

**Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.

**Rationale:** Improves template argument deduction failure.

**Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

12.4 (destructors)

**Change:** User-declared destructors have an implicit exception specification.

**Rationale:** Clarification of destructor requirements.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this International Standard. In particular, destructors that throw exceptions will call `std::terminate()` (without calling `std::unexpected()`) if their exception specification is `noexcept` or `noexcept(true)`. For a throwing virtual destructor of a derived class, `std::terminate()` can be avoided only if the base class virtual destructor has an exception specification that is not `noexcept` and not `noexcept(true)`.

## C.2.7 Clause 14: templates

[diff.cpp03.temp]

14.1

**Change:** Remove `export`

**Rationale:** No implementation consensus.

**Effect on original feature:** A valid C++ 2003 declaration containing `export` is ill-formed in this International Standard.

14.3

**Change:** Remove whitespace requirement for nested closing template right angle brackets

**Rationale:** Considered a persistent but minor annoyance. Template aliases representing nonclass types would exacerbate whitespace issues.

**Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example, the following code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this International Standard because “>>” closes two templates.

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

14.6.4.2

**Change:** Allow dependent calls of functions with internal linkage

**Rationale:** Overly constrained, simplify overload resolution rules.

**Effect on original feature:** A valid C++ 2003 program could get a different result than this International Standard.

## C.2.8 Clause 17: library introduction

[diff.cpp03.library]

17 – 30

**Change:** New reserved identifiers

**Rationale:** Required by new features.

**Effect on original feature:** Valid C++ 2003 code that uses any identifiers added to the C++ standard library by this International Standard may fail to compile or produce different results in This International Standard. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this International Standard.

### 17.6.1.2

**Change:** New headers

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<array>`, `<atomic>`, `<chrono>`, `<codecvt>`, `<condition_variable>`, `<forward_list>`, `<future>`, `<initializer_list>`, `<mutex>`, `<random>`, `<ratio>`, `<regex>`, `<scoped_allocator>`, `<system_error>`, `<thread>`, `<tuple>`, `<typeindex>`, `<type_traits>`, `<unordered_map>`, and `<unordered_set>`. In addition the following C compatibility headers are new: `<ccomplex>`, `<cfenv>`, `<cinttypes>`, `<cstdalign>`, `<cstdbool>`, `<cstdint>`, `<ctgmath>`, and `<cuchar>`. Valid C++ 2003 code that `#includes` headers with these names may be invalid in this International Standard.

### 17.6.3.2

**Effect on original feature:** Function `swap` moved to a different header

**Rationale:** Remove dependency on `<algorithm>` for `swap`.

**Effect on original feature:** Valid C++ 2003 code that has been compiled expecting `swap` to be in `<algorithm>` may have to instead include `<utility>`.

### 17.6.4.2.2

**Change:** New reserved namespace

**Rationale:** New functionality.

**Effect on original feature:** The global namespace `posix` is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace `posix` may be invalid in this International Standard.

### 17.6.5.3

**Change:** Additional restrictions on macro names

**Rationale:** Avoid hard to diagnose or non-portable constructs.

**Effect on original feature:** Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines `override`, `final`, `carries_dependency`, or `noreturn` as macros is invalid in this International Standard.

## C.2.9 Clause 18: language support library

[diff.cpp03.language.support]

### 18.6.2.1

**Change:** Linking `new` and `delete` operators

**Rationale:** The two throwing single-object signatures of `operator new` and `operator delete` are now specified to form the base functionality for the other operators. This clarifies that replacing just these two signatures changes others, even if they are not explicitly changed.

**Effect on original feature:** Valid C++ 2003 code that replaces global `new` or `delete` operators may execute differently in this International Standard. For example, the following program should write "custom deallocation" twice, once for the single-object `delete` and once for the array `delete`.

```
#include <cstdio>
#include <cstdlib>
#include <new>

void* operator new(std::size_t size) throw(std::bad_alloc) {
    return std::malloc(size);
}

void operator delete(void* ptr) throw() {
    std::puts("custom deallocation");
}
```

```

    std::free(ptr);
}

int main() {
    int* i = new int;
    delete i;                // single-object delete
    int* a = new int[3];
    delete [] a;             // array delete
    return 0;
}

```

### 18.6.2.1

**Change:** operator `new` may throw exceptions other than `std::bad_alloc`

**Rationale:** Consistent application of `noexcept`.

**Effect on original feature:** Valid C++ 2003 code that assumes that global operator `new` only throws `std::bad_alloc` may execute differently in this International Standard.

## C.2.10 Clause 19: diagnostics library

[diff.cpp03.diagnostics]

### 19.4

**Change:** Thread-local error numbers

**Rationale:** Support for new thread facilities.

**Effect on original feature:** Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this International Standard.

## C.2.11 Clause 20: general utilities library

[diff.cpp03.utilities]

### 20.9.4

**Change:** Minimal support for garbage-collected regions

**Rationale:** Required by new feature.

**Effect on original feature:** Valid C++ 2003 code, compiled without traceable pointer support, that interacts with newer C++ code using regions declared reachable may have different runtime behavior.

### 20.12.4, 20.12.5, 20.12.6, 20.12.7, 20.12.8, D.7.3

**Change:** Standard function object types no longer derived from `std::unary_function` or `std::binary_function`

**Rationale:** Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

**Effect on original feature:** Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this International Standard.

## C.2.12 Clause 21: strings library

[diff.cpp03.strings]

### 21.3

**Change:** `basic_string` requirements no longer allow reference-counted strings

**Rationale:** Invalidation is subtly different with reference-counted strings. This change regularizes behavior for this International Standard.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this International Standard.

#### 21.3.1.1

**Change:** Loosen `basic_string` invalidation rules

**Rationale:** Allow small-string optimization.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this International Standard. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

**C.2.13 Clause 23: containers library**

[diff.cpp03.containers]

**23.2****Change:** Complexity of `size()` member functions now constant**Rationale:** Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.**Effect on original feature:** Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this International Standard. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.**23.2****Change:** Requirements change: relaxation**Rationale:** Clarification.**Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

- not all containers provide `size()`; use `empty()` instead of `size() == 0`;
- not all containers are empty after construction (`array`);
- not all containers have constant complexity for `swap()` (`array`).

**23.2****Change:** Requirements change: default constructible**Rationale:** Clarification of container requirements.**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.**23.2.3, 23.2.4****Change:** Signature changes: from `void` return types**Rationale:** Old signature threw away useful information that may be expensive to recalculate.**Effect on original feature:** The following member functions have changed:

- `erase(iter)` for `set`, `multiset`, `map`, `multimap`
- `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
- `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this International Standard.**23.2.3, 23.2.4****Change:** Signature changes: from `iterator` to `const_iterator` parameters**Rationale:** Overspecification. *Effects:* The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

- `insert(iter, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`
- `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`
- `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- all forms of `list::splice`

— all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this International Standard.

[23.2.3](#), [23.2.4](#)

**Change:** Signature changes: `resize`

**Rationale:** Performance, compatibility with move semantics.

**Effect on original feature:** For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this International Standard.

## C.2.14 Clause [25](#): algorithms library [diff.cpp03.algorithms]

[25.1](#)

**Change:** Result state of inputs after application of some algorithms

**Rationale:** Required by new feature.

**Effect on original feature:** A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this International Standard. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.

## C.2.15 Clause [26](#): numerics library [diff.cpp03.numerics]

[26.5](#)

**Change:** Specified representation of complex numbers

**Rationale:** Compatibility with C99.

**Effect on original feature:** Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this International Standard.

## C.2.16 Clause [27](#): Input/output library [diff.cpp03.input.output]

[27.7.2.1.3](#), [27.7.3.4](#), [27.5.5.4](#)

**Change:** Specify use of `explicit` in existing boolean conversion operators

**Rationale:** Clarify intentions, avoid workarounds.

**Effect on original feature:** Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this International Standard. Such conversions occur in the following conditions:

- passing a value to a function that takes an argument of type `bool`;
- using `operator==` to compare to `false` or `true`;
- returning a value from a function with a return type of `bool`;
- initializing members of type `bool` via aggregate initialization;
- initializing a `const bool&` which would bind to a temporary.

[27.5.3.1.1](#)

**Change:** Change base class of `std::ios_base::failure`

**Rationale:** More detailed error messages.

**Effect on original feature:** `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this International Standard.

[27.5.3](#)

**Change:** Flag types in `std::ios_base` are now bitmasks with values defined as `constexpr` static members

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this International Standard. For example:

```
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag);          // error: setf does not take argument of type int
    return 0;
}
```

### C.3 C++ and ISO C++ 2011

[diff.cpp11]

- <sup>1</sup> This subclause lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, *Programming Language — C++*), by the chapters of this document.

#### C.3.1 Clause 2: lexical conventions

[diff.cpp11.lex]

##### 2.9

**Change:** *pp-number* can contain one or more single quotes.

**Rationale:** Necessary to enable single quotes as digit separators.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this International Standard. For example, the following code is valid both in C++ 2011 and in this International Standard, but the macro invocation produces different outcomes because the single quotes delimit a character literal in C++ 2011, whereas they are digit separators in this International Standard:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4) };
// int x[2] = {};           — C++ 2011
// int x[2] = { 3'4 };      — this International Standard
```

#### C.3.2 Clause 3: basic concepts

[diff.cpp11.basic]

##### 3.7.4.2

**Change:** New usual (non-placement) deallocator

**Rationale:** Required for sized deallocation.

**Effect on original feature:** Valid C++ 2011 code could declare a global placement allocation function and deallocation function as follows:

```
void operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this International Standard, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (3.7.4). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (5.3.4).

#### C.3.3 Clause 5: expressions

[diff.cpp11.expr]

##### 5.16

**Change:** A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.

**Rationale:** Formerly mandated conversions (lvalue-to-rvalue (4.1), array-to-pointer (4.2), and function-to-pointer (4.3) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.

**Effect on original feature:** Valid C++ 2011 code that relies on the conversions may behave differently in this International Standard:

```

struct S {
    int x = 1;
    void mf() { x = 2; }
};
int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}

```

In C++ 2011, `f(true)` returns 1. In this International Standard, it returns 2.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this International Standard, it yields `sizeof(const char[1])`.

### C.3.4 Clause 7: declarations

[diff.cpp11.dcl.dcl]

#### 7.1.5

**Change:** `constexpr` non-static member functions are not implicitly `const` member functions.

**Rationale:** Necessary to allow `constexpr` member functions to mutate the object.

**Effect on original feature:** Valid C++ 2011 code may fail to compile in this International Standard. For example, the following code is valid in C++ 2011 but invalid in this International Standard because it declares the same member function twice with different return types:

```

struct S {
    constexpr const int &f();
    int &f();
};

```

### C.3.5 Clause 8: declarators

[diff.cpp11.dcl.decl]

#### 8.5.1

**Change:** Classes with default member initializers can be aggregates.

**Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this International Standard.

```

struct S { // Aggregate in C++ 2014 onwards.
    int m = 1;
};
struct X {
    operator int();
    operator S();
};
X a{};
S b{a}; // uses copy constructor in C++ 2011,
        // performs aggregate initialization in this International Standard

```

### C.3.6 Clause 12: special member functions

[diff.cpp11.special]

#### 12.6.3

**Change:** Inheriting a constructor no longer injects a constructor into the derived class.

**Rationale:** Better interaction with other language features.

**Effect on original feature:** Valid C++ 2014 code that uses inheriting constructors may not be valid or

may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

```
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L); // now calls B(int), used to call B<long>(long),
          // which called A(int) due to substitution failure
          // in A<long>(long).
```

### C.3.7 Clause 17: library introduction

[diff.cpp11.library]

#### 17.6.1.2

**Change:** New header.

**Rationale:** New functionality.

**Effect on original feature:** The C++ header `<shared_mutex>` is new. Valid C++ 2011 code that `#includes` a header with that name may be invalid in this International Standard.

### C.3.8 Clause 27: input/output library

[diff.cpp11.input.output]

#### 27.11

**Change:** `gets` is not defined.

**Rationale:** Use of `gets` is considered dangerous.

**Effect on original feature:** Valid C++ 2011 code that uses the `gets` function may fail to compile in this International Standard.

## C.4 C++ and ISO C++ 2014

[diff.cpp14]

- <sup>1</sup> This subclause lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, *Programming Languages — C++*), by the chapters of this document.

### C.4.1 Clause 2: lexical conventions

[diff.cpp14.lex]

#### 2.2

**Change:** Removal of trigraph support as a required feature.

**Rationale:** Prevents accidental uses of trigraphs in non-raw string literals and comments.

**Effect on original feature:** Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this International Standard. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from physical source file characters to the basic source character set.

### C.4.2 Clause 5: expressions

[diff.cpp14.expr]

#### 5.2.6, 5.3.2

**Change:** Remove increment operator with `bool` operand.

**Rationale:** Obsolete feature with occasionally surprising semantics.

**Effect on original feature:** A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this International Standard. Note that this might occur when the lvalue has a type given by a template parameter.

## C.4.3 Clause 7: declarations

[diff.cpp14.dcl.dcl]

## 7.1.1

**Change:** Removal of `register storage-class-specifier`.

**Rationale:** Enable repurposing of deprecated keyword in future revisions of this International Standard.

**Effect on original feature:** A valid C++ 2014 declaration utilizing the `register storage-class-specifier` is ill-formed in this International Standard. The specifier can simply be removed to retain the original meaning.

## 7.1.6.4

**Change:** auto deduction from *braced-init-list*.

**Rationale:** More intuitive deduction behavior.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this International Standard. For example:

```
auto x1{1};    // was std::initializer_list<int>, now int
auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
```

## C.4.4 Clause 8: declarators

[diff.cpp14.decl]

## 8.3.5

**Change:** Make exception specifications be part of the type system.

**Rationale:** Improve type-safety.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or change meaning in this International Standard:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);    // ill-formed; previously well-formed
```

## 8.5.1

**Change:** Definition of an aggregate is extended to apply to user-defined types with base classes.

**Rationale:** To increase convenience of aggregate initialization.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this International Standard; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types:

```
struct derived;
struct base {
    friend struct derived;
private:
    base();
};
struct derived : base {};

derived d1{};    // Error. The code was well-formed before.
derived d2{};    // still OK
```

## C.4.5 Clause 21: strings library

[diff.cpp14.string]

## 21.3.1

**Change:** Non-const `.data()` member added.

**Rationale:** The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior for this International Standard.

**Effect on original feature:** Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string's `.data()` member in this International Standard.

```
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

#### C.4.6 Annex D: compatibility features

[diff.cpp14.depr]

**Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.

**Rationale:** Superseded by new features.

**Effect on original feature:** Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this International Standard.

**Change:** Remove old iostreams members [depr.ios.members].

**Rationale:** Redundant feature for compatibility with pre-standard code has served its time.

**Effect on original feature:** A valid C++ 2014 program using these identifiers may be ill-formed in this International Standard.

#### C.5 C standard library

[diff.library]

- <sup>1</sup> This subclause summarizes the contents of the C++ standard library included from the Standard C library. It also summarizes the explicit changes in definitions, declarations, or behavior from the Standard C library noted in other subclauses (17.6.1.2, 18.2, 21.5).
- <sup>2</sup> The C++ standard library provides 51 standard macros from the C library, as shown in Table 167.
- <sup>3</sup> The header names (enclosed in < and >) indicate that the macro may be defined in more than one header. All such definitions are equivalent (3.2).

Table 167 — Standard macros

|                             |                                   |                                   |                      |                                  |
|-----------------------------|-----------------------------------|-----------------------------------|----------------------|----------------------------------|
| <code>assert</code>         | <code>HUGE_VAL</code>             | <code>NULL &lt;cstdlib&gt;</code> | <code>SIGILL</code>  | <code>va_copy</code>             |
| <code>BUFSIZ</code>         | <code>LC_ALL</code>               | <code>NULL &lt;cstring&gt;</code> | <code>SIGINT</code>  | <code>va_end</code>              |
| <code>CLOCKS_PER_SEC</code> | <code>LC_COLLATE</code>           | <code>NULL &lt;ctime&gt;</code>   | <code>SIGSEGV</code> | <code>va_start</code>            |
| <code>EDOM</code>           | <code>LC_CTYPE</code>             | <code>NULL &lt;wchar&gt;</code>   | <code>SIGTERM</code> | <code>WCHAR_MAX</code>           |
| <code>EILSEQ</code>         | <code>LC_MONETARY</code>          | <code>offsetof</code>             | <code>SIG_DFL</code> | <code>WCHAR_MIN</code>           |
| <code>EOF</code>            | <code>LC_NUMERIC</code>           | <code>RAND_MAX</code>             | <code>SIG_ERR</code> | <code>WEOF &lt;wchar&gt;</code>  |
| <code>ERANGE</code>         | <code>LC_TIME</code>              | <code>SEEK_CUR</code>             | <code>SIG_IGN</code> | <code>WEOF &lt;wctype&gt;</code> |
| <code>errno</code>          | <code>L_tmpnam</code>             | <code>SEEK_END</code>             | <code>stderr</code>  | <code>_IOFBF</code>              |
| <code>EXIT_FAILURE</code>   | <code>MB_CUR_MAX</code>           | <code>SEEK_SET</code>             | <code>stdin</code>   | <code>_IOLBF</code>              |
| <code>EXIT_SUCCESS</code>   | <code>NULL &lt;locale&gt;</code>  | <code>setjmp</code>               | <code>stdout</code>  | <code>_IONBF</code>              |
| <code>FILENAME_MAX</code>   | <code>NULL &lt;cstddef&gt;</code> | <code>SIGABRT</code>              | <code>TMP_MAX</code> |                                  |
| <code>FOPEN_MAX</code>      | <code>NULL &lt;stdio&gt;</code>   | <code>SIGFPE</code>               | <code>va_arg</code>  |                                  |

- <sup>4</sup> The C++ standard library provides 45 standard values from the C library, as shown in Table 168.
- <sup>5</sup> The C++ standard library provides 15 standard types from the C library, as shown in Table 169.
- <sup>6</sup> The C++ standard library provides 2 standard `structs` from the C library, as shown in Table 170.
- <sup>7</sup> The C++ standard library provides 209 standard functions from the C library, as shown in Table 171.

Table 168 — Standard values

|                |                |                 |            |
|----------------|----------------|-----------------|------------|
| CHAR_BIT       | FLT_DIG        | INT_MIN         | MB_LEN_MAX |
| CHAR_MAX       | FLT_EPSILON    | LDBL_DIG        | SCHAR_MAX  |
| CHAR_MIN       | FLT_MANT_DIG   | LDBL_EPSILON    | SCHAR_MIN  |
| DBL_DIG        | FLT_MAX        | LDBL_MANT_DIG   | SHRT_MAX   |
| DBL_EPSILON    | FLT_MAX_10_EXP | LDBL_MAX        | SHRT_MIN   |
| DBL_MANT_DIG   | FLT_MAX_EXP    | LDBL_MAX_10_EXP | UCHAR_MAX  |
| DBL_MAX        | FLT_MIN        | LDBL_MAX_EXP    | UINT_MAX   |
| DBL_MAX_10_EXP | FLT_MIN_10_EXP | LDBL_MIN        | ULONG_MAX  |
| DBL_MAX_EXP    | FLT_MIN_EXP    | LDBL_MIN_10_EXP | USHRT_MAX  |
| DBL_MIN        | FLT_RADIX      | LDBL_MIN_EXP    |            |
| DBL_MIN_10_EXP | FLT_ROUNDS     | LONG_MAX        |            |
| DBL_MIN_EXP    | INT_MAX        | LONG_MIN        |            |

Table 169 — Standard types

|         |                 |                 |                  |
|---------|-----------------|-----------------|------------------|
| clock_t | ldiv_t          | size_t <stdio>  | va_list          |
| div_t   | mbstate_t       | size_t <stdlib> | wctrans_t        |

### C.5.1 Modifications to headers

[diff.mods.to.headers]

- <sup>1</sup> For compatibility with the Standard C library, the C++ standard library provides the C headers enumerated in D.3, but their use is deprecated in C++.

### C.5.2 Modifications to definitions

[diff.mods.to.definitions]

#### C.5.2.1 Types char16\_t and char32\_t

[diff.char16]

- <sup>1</sup> The types char16\_t and char32\_t are distinct types rather than typedefs to existing integral types.

#### C.5.2.2 Type wchar\_t

[diff.wchar.t]

- <sup>1</sup> wchar\_t is a keyword in this International Standard (2.11). It does not appear as a type name defined in any of <stddef>, <stdlib>, or <wchar> (21.5).

#### C.5.2.3 Header <iso646.h>

[diff.header.iso646.h]

- <sup>1</sup> The tokens and, and\_eq, bitand, bitor, compl, not\_eq, not, or, or\_eq, xor, and xor\_eq are keywords in this International Standard (2.11). They do not appear as macro names defined in <iso646>.

#### C.5.2.4 Macro NULL

[diff.null]

- <sup>1</sup> The macro NULL, defined in any of <locale>, <stddef>, <stdio>, <stdlib>, <string>, <ctime>, or <wchar>, is an implementation-defined C++ null pointer constant in this International Standard (18.2).

### C.5.3 Modifications to declarations

[diff.mods.to.declarations]

- <sup>1</sup> Header <cstring>: The following functions have different declarations:

Table 171 — Standard functions

|          |          |            |           |           |            |
|----------|----------|------------|-----------|-----------|------------|
| abort    | fmod     | iswalnum   | modf      | strlen    | wscat      |
| abs      | fopen    | iswalpha   | perror    | strncat   | wcschr     |
| acos     | fprintf  | iswcntrl   | pow       | strncmp   | wscmp      |
| asctime  | fputc    | iswctype   | printf    | strncpy   | wscoll     |
| asin     | fputs    | iswdigit   | putc      | strpbrk   | wscopy     |
| atan     | fputwc   | iswgraph   | putchar   | strrchr   | wscspn     |
| atan2    | fputws   | iswlower   | puts      | strspn    | wcsftime   |
| atexit   | fread    | iswprint   | putwc     | strstr    | wcslen     |
| atof     | free     | iswpunct   | putwchar  | strtod    | wcsncat    |
| atoi     | freopen  | iswspace   | qsort     | strtok    | wcsncmp    |
| atol     | frexp    | iswupper   | raise     | strtol    | wcsncpy    |
| bsearch  | fscanf   | iswxdigit  | rand      | strtoul   | wcspbrk    |
| btowc    | fseek    | isxdigit   | realloc   | strxfrm   | wcsrchr    |
| calloc   | fsetpos  | labs       | remove    | swprintf  | wcsrtoombs |
| ceil     | ftell    | ldexp      | rename    | swscanf   | wcsspn     |
| clearerr | fwide    | ldiv       | rewind    | system    | wcsstr     |
| clock    | fwprintf | localeconv | scanf     | tan       | wctod      |
| cos      | fwrite   | localtime  | setbuf    | tanh      | wctok      |
| cosh     | fwscanf  | log        | setlocale | time      | wctol      |
| ctime    | getc     | log10      | setvbuf   | tmpfile   | wctombs    |
| difftime | getchar  | longjmp    | signal    | tmpnam    | wctoul     |
| div      | getenv   | malloc     | sin       | tolower   | wcsxfrm    |
| exit     | getwc    | mblen      | sinh      | toupper   | wctob      |
| exp      | getwchar | mbrlen     | sprintf   | towctrans | wctomb     |
| fabs     | gmtime   | mbrtowc    | sqrt      | tolower   | wctrans    |
| fclose   | isalnum  | mbsinit    | srand     | toupper   | wctype     |
| feof     | isalpha  | mbsrtowcs  | sscanf    | ungetc    | wmemchr    |
| ferror   | iscntrl  | mbstowcs   | strcat    | ungetwc   | wmemcmp    |
| fflush   | isdigit  | mbtowc     | strchr    | vfprintf  | wmemcpy    |
| fgetc    | isgraph  | memchr     | strcmp    | vfwprintf | wmemmove   |
| fgetpos  | islower  | memcmp     | strcoll   | vprintf   | wmemset    |
| fgets    | isprint  | memcpy     | strcpy    | vsprintf  | wprintf    |
| fgetwc   | ispunct  | memmove    | strcspn   | vswprintf | wscanf     |
| fgetws   | isspace  | memset     | strerror  | vwprintf  |            |
| floor    | isupper  | mktime     | strftime  | wcrtomb   |            |

- (1.1) — `strchr`
- (1.2) — `strpbrk`
- (1.3) — `strrchr`
- (1.4) — `strstr`
- (1.5) — `memchr`

[21.5](#) describes the changes.

#### C.5.4 Modifications to behavior

[diff.mods.to.behavior]

- <sup>1</sup> Header `<cstdlib>`: The following functions have different behavior:

- (1.1) — `atexit`
- (1.2) — `exit`
- (1.3) — `abort`

[18.5](#) describes the changes.

- <sup>2</sup> Header `<setjmp>`: The following functions have different behavior:

- (2.1) — `longjmp`

[18.10](#) describes the changes.

##### C.5.4.1 Macro `offsetof(type, member-designator)`

[diff.offsetof]

- <sup>1</sup> The macro `offsetof`, defined in `<cstddef>`, accepts a restricted set of `type` arguments in this International Standard. [18.2](#) describes the change.

##### C.5.4.2 Memory allocation functions

[diff.malloc]

- <sup>1</sup> The functions `calloc`, `malloc`, and `realloc` are restricted in this International Standard. [20.9.13](#) describes the changes.

# Annex D (normative)

## Compatibility features

[depr]

- <sup>1</sup> This Clause describes features of the C++ Standard that are specified for compatibility with existing implementations.
- <sup>2</sup> These are deprecated features, where *deprecated* is defined as: Normative for the current edition of the Standard, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this section with the **deprecated** attribute (7.6.4).

### D.1 Implicit declaration of copy functions [depr.impldec]

- <sup>1</sup> The implicit definition of a copy constructor as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor. The implicit definition of a copy assignment operator as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor (12.4, 12.8). In a future revision of this International Standard, these implicit definitions could become deleted (8.4).

### D.2 Dynamic exception specifications [depr.except.spec]

- <sup>1</sup> The use of *dynamic-exception-specifications* is deprecated.

### D.3 C standard library headers [depr.c.headers]

- <sup>1</sup> For compatibility with the C standard library and the C Unicode TR, the C++ standard library provides the 26 *C headers*, as shown in Table 172.

Table 172 — C headers

|             |              |              |            |            |
|-------------|--------------|--------------|------------|------------|
| <assert.h>  | <inttypes.h> | <signal.h>   | <stdio.h>  | <wchar.h>  |
| <complex.h> | <iso646.h>   | <stdalign.h> | <stdlib.h> | <wctype.h> |
| <ctype.h>   | <limits.h>   | <stdarg.h>   | <string.h> |            |
| <errno.h>   | <locale.h>   | <stdbool.h>  | <tgmath.h> |            |
| <fenv.h>    | <math.h>     | <stddef.h>   | <time.h>   |            |
| <float.h>   | <setjmp.h>   | <stdint.h>   | <uchar.h>  |            |

- <sup>2</sup> Except for the functions declared in 26.10, every C header, each of which has a name of the form **name.h**, behaves as if each name placed in the standard library namespace by the corresponding *cname* header is placed within the global namespace scope. It is unspecified whether these names are first declared or defined within namespace scope (3.3.6) of the namespace **std** and are then injected into the global namespace scope by explicit *using-declarations* (7.3.3).
- <sup>3</sup> [Example: The header <cstdlib> assuredly provides its declarations and definitions within the namespace **std**. It may also provide these names within the global namespace. The header <stdlib.h> assuredly provides the same declarations and definitions within the global namespace, much as in the C Standard. It may also provide these names within the namespace **std**. — end example]

### D.4 char\* streams [depr.str.strstreams]

- <sup>1</sup> The header <strstream> defines three types that associate stream buffers with character array objects and assist reading and writing such objects.

D.4.1 Class `strstreambuf`

[depr.strstreambuf]

```

namespace std {
    class strstreambuf : public basic_streambuf<char> {
    public:
        explicit strstreambuf(streamsize alsize_arg = 0);
        strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
        strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = 0);
        strstreambuf(const char* gnext_arg, streamsize n);

        strstreambuf(signed char* gnext_arg, streamsize n,
                     signed char* pbeg_arg = 0);
        strstreambuf(const signed char* gnext_arg, streamsize n);
        strstreambuf(unsigned char* gnext_arg, streamsize n,
                     unsigned char* pbeg_arg = 0);
        strstreambuf(const unsigned char* gnext_arg, streamsize n);

        virtual ~strstreambuf();

        void freeze(bool freezefl = true);
        char* str();
        int pcount();

    protected:
        virtual int_type overflow(int_type c = EOF);
        virtual int_type pbackfail(int_type c = EOF);
        virtual int_type underflow();
        virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);
        virtual pos_type seekpos(pos_type sp, ios_base::openmode which
                                = ios_base::in | ios_base::out);
        virtual streambuf* setbuf(char* s, streamsize n);

    private:
        typedef T1 strstate;           // exposition only
        static const strstate allocated; // exposition only
        static const strstate constant; // exposition only
        static const strstate dynamic;  // exposition only
        static const strstate frozen;    // exposition only
        strstate strmode;                // exposition only
        streamsize alsize;               // exposition only
        void* (*palloc)(size_t);         // exposition only
        void (*pfree)(void*);            // exposition only
    };
}

```

<sup>1</sup> The class `strstreambuf` associates the input sequence, and possibly the output sequence, with an object of some *character* array type, whose elements store arbitrary values. The array object has several attributes.

<sup>2</sup> [Note: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as `T1`) called `strstate`. The elements are:

- (2.1) — `allocated`, set when a dynamic array object has been allocated, and hence should be freed by the destructor for the `strstreambuf` object;
- (2.2) — `constant`, set when the array object has `const` elements, so the output sequence cannot be written;

- (2.3) — **dynamic**, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;
- (2.4) — **frozen**, set when the program has requested that the array object not be altered, reallocated, or freed.

— *end note*]

<sup>3</sup> [ *Note*: For the sake of exposition, the maintained data is presented here as:

- (3.1) — **strstate** **strmode**, the attributes of the array object associated with the **strstreambuf** object;
- (3.2) — **int** **alsize**, the suggested minimum size for a dynamic array object;
- (3.3) — **void\*** **(\*palloc)(size\_t)**, points to the function to call to allocate a dynamic array object;
- (3.4) — **void** **(\*pfree)(void\*)**, points to the function to call to free a dynamic array object.

— *end note*]

<sup>4</sup> Each object of class **strstreambuf** has a *seekable area*, delimited by the pointers **seeklow** and **seekhigh**. If **gnext** is a null pointer, the seekable area is undefined. Otherwise, **seeklow** equals **gbeg** and **seekhigh** is either **pend**, if **pend** is not a null pointer, or **gend**.

#### D.4.1.1 **strstreambuf** constructors

[depr.strstreambuf.cons]

```
explicit strstreambuf(streamsize alsize_arg = 0);
```

<sup>1</sup> *Effects*: Constructs an object of class **strstreambuf**, initializing the base class with **streambuf()**. The postconditions of this function are indicated in Table 173.

Table 173 — **strstreambuf(streamsize)** effects

| Element        | Value             |
|----------------|-------------------|
| <b>strmode</b> | <b>dynamic</b>    |
| <b>alsize</b>  | <b>alsize_arg</b> |
| <b>palloc</b>  | a null pointer    |
| <b>pfree</b>   | a null pointer    |

```
strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
```

<sup>2</sup> *Effects*: Constructs an object of class **strstreambuf**, initializing the base class with **streambuf()**. The postconditions of this function are indicated in Table 174.

Table 174 — **strstreambuf(void\* (\*)(size\_t), void (\*)(void\*))** effects

| Element        | Value                |
|----------------|----------------------|
| <b>strmode</b> | <b>dynamic</b>       |
| <b>alsize</b>  | an unspecified value |
| <b>palloc</b>  | <b>palloc_arg</b>    |
| <b>pfree</b>   | <b>pfree_arg</b>     |

```
strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = 0);
strstreambuf(signed char* gnext_arg, streamsize n,
    signed char* pbeg_arg = 0);
strstreambuf(unsigned char* gnext_arg, streamsize n,
    unsigned char* pbeg_arg = 0);
```

- 3 *Effects:* Constructs an object of class `strstreambuf`, initializing the base class with `streambuf()`. The postconditions of this function are indicated in Table 175.

Table 175 — `strstreambuf(charT*, streamsize, charT*)` effects

| Element              | Value                |
|----------------------|----------------------|
| <code>strmode</code> | 0                    |
| <code>alsize</code>  | an unspecified value |
| <code>palloc</code>  | a null pointer       |
| <code>pfree</code>   | a null pointer       |

- 4 `gnext_arg` shall point to the first element of an array object whose number of elements `N` is determined as follows:
- (4.1) — If `n > 0`, `N` is `n`.
- (4.2) — If `n == 0`, `N` is `std::strlen(gnext_arg)`.
- (4.3) — If `n < 0`, `N` is `INT_MAX`.<sup>339</sup>
- 5 If `pbeg_arg` is a null pointer, the function executes:
- ```
setg(gnext_arg, gnext_arg, gnext_arg + N);
```
- 6 Otherwise, the function executes:
- ```
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);

strstreambuf(const char* gnext_arg, streamsize n);
strstreambuf(const signed char* gnext_arg, streamsize n);
strstreambuf(const unsigned char* gnext_arg, streamsize n);
```
- 7 *Effects:* Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets `constant` in `strmode`.
- ```
virtual ~strstreambuf();
```
- 8 *Effects:* Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `strmode & allocated != 0` and `strmode & frozen == 0`. (D.4.1.3 describes how a dynamically allocated array object is freed.)

#### D.4.1.2 Member functions

[depr.strstreambuf.members]

```
void freeze(bool freezefl = true);
```

- 1 *Effects:* If `strmode & dynamic` is non-zero, alters the freeze status of the dynamic array object as follows:
- (1.1) — If `freezefl` is `true`, the function sets `frozen` in `strmode`.
- (1.2) — Otherwise, it clears `frozen` in `strmode`.

```
char* str();
```

- 2 *Effects:* Calls `freeze()`, then returns the beginning pointer for the input sequence, `gbeg`.
- 3 *Remarks:* The return value can be a null pointer.

<sup>339</sup>) The function signature `strlen(const char*)` is declared in `<cstring>`. (21.5). The macro `INT_MAX` is defined in `<climits>` (18.3).

```
int pcount() const;
```

- 4 *Effects:* If the next pointer for the output sequence, `pnext`, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, `pnext - pbeg`.

#### D.4.1.3 `strstreambuf` overridden virtual functions

[depr.strstreambuf.virtuals]

```
int_type overflow(int_type c = EOF);
```

- 1 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:
- (1.1) — If `c != EOF` and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns `c` to `*pnext++`.  
Returns `(unsigned char)c`.
  - (1.2) — If `c == EOF`, there is no character to append.  
Returns a value other than `EOF`.
- 2 Returns `EOF` to indicate failure.
- 3 *Remarks:* The function can alter the number of write positions available as a result of any call.
- 4 To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements `n` to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified.<sup>340</sup> If `palloc` is not a null pointer, the function calls `(*palloc)(n)` to allocate the new dynamic array object. Otherwise, it evaluates the expression `new charT[n]`. In either case, if the allocation fails, the function returns `EOF`. Otherwise, it sets `allocated` in `strmode`.
- 5 To free a previously existing dynamic array object whose first element address is `p`: If `pfree` is not a null pointer, the function calls `(*pfree)(p)`. Otherwise, it evaluates the expression `delete[] p`.
- 6 If `strmode & dynamic == 0`, or if `strmode & frozen != 0`, the function cannot extend the array (reallocate it with greater length) to make a write position available.

```
int_type pbackfail(int_type c = EOF);
```

- 7 Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:
- (7.1) — If `c != EOF`, if the input sequence has a putback position available, and if `(char)c == gnext[-1]`, assigns `gnext - 1` to `gnext`.  
Returns `c`.
  - (7.2) — If `c != EOF`, if the input sequence has a putback position available, and if `strmode & constant` is zero, assigns `c` to `*--gnext`.  
Returns `c`.
  - (7.3) — If `c == EOF` and if the input sequence has a putback position available, assigns `gnext - 1` to `gnext`.  
Returns a value other than `EOF`.
- 8 Returns `EOF` to indicate failure.
- 9 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type underflow();
```

---

340) An implementation should consider `alsize` in making this decision.

10 *Effects:* Reads a character from the *input sequence*, if possible, without moving the stream position past it, as follows:

- (10.1) — If the input sequence has a read position available, the function signals success by returning `(unsigned char)*gnext`.
- (10.2) — Otherwise, if the current write next pointer `pnext` is not a null pointer and is greater than the current read end pointer `gend`, makes a *read position* available by assigning to `gend` a value greater than `gnext` and no greater than `pnext`.  
Returns `(unsigned char*)gnext`.

11 Returns EOF to indicate failure.

12 *Remarks:* The function can alter the number of read positions available as a result of any call.

`pos_type seekoff(off_type off, seekdir way, openmode which = in | out);`

13 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 176.

Table 176 — `seekoff` positioning

| Conditions                                                                                                                     | Result                                            |
|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <code>(which &amp; ios::in) != 0</code>                                                                                        | positions the input sequence                      |
| <code>(which &amp; ios::out) != 0</code>                                                                                       | positions the output sequence                     |
| <code>(which &amp; (ios::in   ios::out)) == (ios::in   ios::out)</code> and<br><code>way == either ios::beg or ios::end</code> | positions both the input and the output sequences |
| Otherwise                                                                                                                      | the positioning operation fails.                  |

14 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` as indicated in Table 177.

Table 177 — `newoff` values

| Condition                    | <code>newoff</code> Value                                                           |
|------------------------------|-------------------------------------------------------------------------------------|
| <code>way == ios::beg</code> | 0                                                                                   |
| <code>way == ios::cur</code> | the next pointer minus the beginning pointer ( <code>xnext - xbeg</code> ).         |
| <code>way == ios::end</code> | <code>seekhigh</code> minus the beginning pointer ( <code>seekhigh - xbeg</code> ). |

15 If  $(\text{newoff} + \text{off}) < (\text{seeklow} - \text{xbeg})$  or  $(\text{seekhigh} - \text{xbeg}) < (\text{newoff} + \text{off})$ , the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

16 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

`pos_type seekpos(pos_type sp, ios_base::openmode which  
= ios_base::in | ios_base::out);`

- 17 *Effects:* Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in `sp` (as described below).
- (17.1) — If `(which & ios::in) != 0`, positions the input sequence.
- (17.2) — If `(which & ios::out) != 0`, positions the output sequence.
- (17.3) — If the function positions neither sequence, the positioning operation fails.
- 18 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` from `sp.offset()`:
- (18.1) — If `newoff` is an invalid stream position, has a negative value, or has a value greater than `(seekhigh - seeklow)`, the positioning operation fails
- (18.2) — Otherwise, the function adds `newoff` to the beginning pointer `xbeg` and stores the result in the next pointer `xnext`.
- 19 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.
- ```
streambuf<char>* setbuf(char* s, streamsize n);
```
- 20 *Effects:* Implementation defined, except that `setbuf(0, 0)` has no effect.

## D.4.2 Class `istream`

[depr.istream]

```
namespace std {
    class istream : public basic_istream<char> {
    public:
        explicit istream(const char* s);
        explicit istream(char* s);
        istream(const char* s, streamsize n);
        istream(char* s, streamsize n);
        virtual ~istream();

        strstreambuf* rdbuf() const;
        char* str();
    private:
        strstreambuf sb; // exposition only
    };
}
```

- 1 The class `istream` supports the reading of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:
- (1.1) — `sb`, the `strstreambuf` object.

### D.4.2.1 `istream` constructors

[depr.istream.cons]

```
explicit istream(const char* s);
explicit istream(char* s);
```

- 1 *Effects:* Constructs an object of class `istream`, initializing the base class with `istream(&sb)` and initializing `sb` with `strstreambuf(s,0)`. `s` shall designate the first element of an NTBS.

```
istream(const char* s, streamsize n);
```

- <sup>2</sup> *Effects:* Constructs an object of class `istream`, initializing the base class with `istream(&sb)` and initializing `sb` with `strstreambuf(s,n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

#### D.4.2.2 Member functions

[depr.istream.members]

```
strstreambuf* rdbuf() const;
```

- <sup>1</sup> *Returns:* `const_cast<strstreambuf*>(&sb)`.

```
char* str();
```

- <sup>2</sup> *Returns:* `rdbuf()->str()`.

#### D.4.3 Class `ostream`

[depr.ostream]

```
namespace std {
    class ostream : public basic_ostream<char> {
    public:
        ostream();
        ostream(char* s, int n, ios_base::openmode mode = ios_base::out);
        virtual ~ostream();

        strstreambuf* rdbuf() const;
        void freeze(bool freezefl = true);
        char* str();
        int pcount() const;
    private:
        strstreambuf sb; // exposition only
    };
}
```

- <sup>1</sup> The class `ostream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:
- (1.1) — `sb`, the `strstreambuf` object.

##### D.4.3.1 `ostream` constructors

[depr.ostream.cons]

```
ostream();
```

- <sup>1</sup> *Effects:* Constructs an object of class `ostream`, initializing the base class with `ostream(&sb)` and initializing `sb` with `strstreambuf()`.

```
ostream(char* s, int n, ios_base::openmode mode = ios_base::out);
```

- <sup>2</sup> *Effects:* Constructs an object of class `ostream`, initializing the base class with `ostream(&sb)`, and initializing `sb` with one of two constructors:
- (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements. The constructor is `strstreambuf(s, n, s)`.
- (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.<sup>341</sup>

<sup>341</sup>) The function signature `strlen(const char*)` is declared in `<cstring>` (21.5).

**D.4.3.2 Member functions****[depr.ostrstream.members]**

```
strstreambuf* rdbuf() const;
```

1 *Returns:* (strstreambuf\*)&sb .

```
void freeze(bool freezefl = true);
```

2 *Effects:* Calls rdbuf()->freeze(freezefl).

```
char* str();
```

3 *Returns:* rdbuf()->str().

```
int pcount() const;
```

4 *Returns:* rdbuf()->pcount().

**D.4.4 Class strstream****[depr.strstream]**

```
namespace std {
    class strstream
        : public basic_istream<char> {
    public:
        // Types
        typedef char                                char_type;
        typedef typename char_traits<char>::int_type int_type;
        typedef typename char_traits<char>::pos_type pos_type;
        typedef typename char_traits<char>::off_type off_type;

        // constructors/destructor
        strstream();
        strstream(char* s, int n,
                  ios_base::openmode mode = ios_base::in|ios_base::out);
        virtual ~strstream();

        // Members:
        strstreambuf* rdbuf() const;
        void freeze(bool freezefl = true);
        int pcount() const;
        char* str();

    private:
        strstreambuf sb; // exposition only
    };
}
```

1 The class **strstream** supports reading and writing from objects of class **strstreambuf**. It supplies a **strstreambuf** object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — **sb**, the **strstreambuf** object.

**D.4.4.1 strstream constructors****[depr.strstream.cons]**

```
strstream();
```

1 *Effects:* Constructs an object of class **strstream**, initializing the base class with **istream(&sb)**.

```

strstream(char* s, int n,
          ios_base::openmode mode = ios_base::in|ios_base::out);

```

- 2 *Effects:* Constructs an object of class `strstream`, initializing the base class with `iostream(&sb)` and initializing `sb` with one of the two constructors:

- (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements. The constructor is `strstreambuf(s,n,s)`.
- (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s,n,s + std::strlen(s))`.

#### D.4.4.2 `strstream` destructor

[depr.strstream.dest]

```
virtual ~strstream();
```

- 1 *Effects:* Destroys an object of class `strstream`.

```
strstreambuf* rdbuf() const;
```

- 2 *Returns:* `&sb`.

#### D.4.4.3 `strstream` operations

[depr.strstream.oper]

```
void freeze(bool freezefl = true);
```

- 1 *Effects:* Calls `rdbuf()->freeze(freezefl)`.

```
char* str();
```

- 2 *Returns:* `rdbuf()->str()`.

```
int pcount() const;
```

- 3 *Returns:* `rdbuf()->pcount()`.

### D.5 Violating *exception-specifications*

[exception.unexpected]

#### D.5.1 Type `unexpected_handler`

[unexpected.handler]

```
typedef void (*unexpected_handler)();
```

- 1 The type of a *handler function* to be called by `unexpected()` when a function attempts to throw an exception not listed in its *dynamic-exception-specification*.
- 2 *Required behavior:* An `unexpected_handler` shall not return. See also 15.5.2.
- 3 *Default behavior:* The implementation's default `unexpected_handler` calls `std::terminate()`.

#### D.5.2 `set_unexpected`

[set.unexpected]

```
unexpected_handler set_unexpected(unexpected_handler f) noexcept;
```

- 1 *Effects:* Establishes the function designated by `f` as the current `unexpected_handler`.
- 2 *Remark:* It is unspecified whether a null pointer value designates the default `unexpected_handler`.
- 3 *Returns:* The previous `unexpected_handler`.

#### D.5.3 `get_unexpected`

[get.unexpected]

```
unexpected_handler get_unexpected() noexcept;
```

- 1 *Returns:* The current `unexpected_handler`. [ *Note:* This may be a null pointer value. — *end note* ]

**D.5.4 unexpected****[unexpected]**

[[noreturn]] void unexpected();

- <sup>1</sup> *Remarks:* Called by the implementation when a function exits via an exception not allowed by its *exception-specification* (15.5.2). May also be called directly by the program.
- <sup>2</sup> *Effects:* Calls an `unexpected_handler` function. It is unspecified which `unexpected_handler` function will be called if an exception is active during a call to `set_unexpected`. Otherwise calls the current `unexpected_handler` function. [ *Note:* A default `unexpected_handler` is always considered a callable handler in this context. — *end note* ]

**D.6 uncaught\_exception****[depr.uncaught]**

bool uncaught\_exception() noexcept;

- <sup>1</sup> *Returns:* `uncaught_exceptions() > 0`.

**D.7 Old adaptable function bindings****[depr.func.adaptor.binding]****D.7.1 Weak result types****[depr.weak.result\_type]**

- <sup>1</sup> A call wrapper (20.12.1) may have a *weak result type*. If it does, the type of its member type `result_type` is based on the type `T` of the wrapper's target object:
- (1.1) — if `T` is a pointer to function type, `result_type` shall be a synonym for the return type of `T`;
  - (1.2) — if `T` is a pointer to member function, `result_type` shall be a synonym for the return type of `T`;
  - (1.3) — if `T` is a class type and the *qualified-id* `T::result_type` is valid and denotes a type (14.8.2), then `result_type` shall be a synonym for `T::result_type`;
  - (1.4) — otherwise `result_type` shall not be defined.

**D.7.2 Typedefs to support function binders****[depr.func.adaptor.typedefs]**

- <sup>1</sup> To enable old function adaptors to manipulate function objects that take one or two arguments, many of the function objects in this standard correspondingly provide typedefs `argument_type` and `result_type` for function objects that take one argument and `first_argument_type`, `second_argument_type`, and `result_type` for function objects that take two arguments.
- <sup>2</sup> The following member names are defined in addition to names specified in Clause 20:

```
namespace std {
    template<class T> struct owner_less<shared_ptr<T> > {
        typedef bool result_type;
        typedef shared_ptr<T> first_argument_type;
        typedef shared_ptr<T> second_argument_type;
    };

    template<class T> struct owner_less<weak_ptr<T> > {
        typedef bool result_type;
        typedef weak_ptr<T> first_argument_type;
        typedef weak_ptr<T> second_argument_type;
    };

    template <class T> class reference_wrapper {
    public :
        typedef see below result_type;           // not always defined
        typedef see below argument_type;         // not always defined
    };
}
```

```

    typedef see below first_argument_type;    // not always defined
    typedef see below second_argument_type;    // not always defined
};

template <class T> struct plus {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct minus {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct multiplies {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct divides {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct modulus {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct negate {
    typedef T argument_type;
    typedef T result_type;
};

template <class T> struct equal_to {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct not_equal_to {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct greater {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

```

```
};

template <class T> struct less {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct greater_equal {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct less_equal {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct logical_and {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct logical_or {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

template <class T> struct logical_not {
    typedef T argument_type;
    typedef bool result_type;
};

template <class T> struct bit_and {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct bit_or {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};

template <class T> struct bit_xor {
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef T result_type;
};
```

```

template <class T> struct bit_not {
    typedef T argument_type;
    typedef T result_type;
};

template<class R, class T1>
class function<R(T1)> {
public:
    typedef T1 argument_type;
};

template<class R, class T1, class T2>
class function<R(T1, T2)> {
public:
    typedef T1 first_argument_type;
    typedef T2 second_argument_type;
};
}

```

- 3 `reference_wrapper<T>` has a weak result type (D.7.1). If `T` is a function type, `result_type` shall be a synonym for the return type of `T`.
- 4 The template specialization `reference_wrapper<T>` shall define a nested type named `argument_type` as a synonym for `T1` only if the type `T` is any of the following:
  - (4.1) — a function type or a pointer to function type taking one argument of type `T1`
  - (4.2) — a pointer to member function `R T0::f cv` (where *cv* represents the member function's cv-qualifiers); the type `T1` is *cv* `T0*`
  - (4.3) — a class type where the *qualified-id* `T::argument_type` is valid and denotes a type (14.8.2); the type `T1` is `T::argument_type`.
- 5 The template instantiation `reference_wrapper<T>` shall define two nested types named `first_argument_type` and `second_argument_type` as synonyms for `T1` and `T2`, respectively, only if the type `T` is any of the following:
  - (5.1) — a function type or a pointer to function type taking two arguments of types `T1` and `T2`
  - (5.2) — a pointer to member function `R T0::f(T2) cv` (where *cv* represents the member function's cv-qualifiers); the type `T1` is *cv* `T0*`
  - (5.3) — a class type where the *qualified-ids* `T::first_argument_type` and `T::second_argument_type` are both valid and both denote types (14.8.2); the type `T1` is `T::first_argument_type` and the type `T2` is `T::second_argument_type`.
- 6 For all object types `Key` for which there exists a specialization `hash<Key>`, and for all enumeration types (7.2) `Key`, the instantiation `hash<Key>` shall provide two nested types, `result_type` and `argument_type`, which shall be synonyms for `size_t` and `Key`, respectively.
- 7 The forwarding call wrapper `g` returned by a call to `bind(f, bound_args...)` (20.12.10.3) shall have a weak result type (D.7.1).
- 8 The forwarding call wrapper `g` returned by a call to `bind<R>(f, bound_args...)` (20.12.10.3) shall have a nested type `result_type` defined as a synonym for `R`.

- <sup>9</sup> The simple call wrapper returned from a call to `mem_fn(pm)` shall have a nested type `result_type` that is a synonym for the return type of `pm` when `pm` is a pointer to member function.
- <sup>10</sup> The simple call wrapper returned from a call to `mem_fn(pm)` shall define two nested types named `argument_type` and `result_type` as synonyms for `cv T*` and `Ret`, respectively, when `pm` is a pointer to member function with cv-qualifier `cv` and taking no arguments, where `Ret` is `pm`'s return type.
- <sup>11</sup> The simple call wrapper returned from a call to `mem_fn(pm)` shall define three nested types named `first_argument_type`, `second_argument_type`, and `result_type` as synonyms for `cv T*`, `T1`, and `Ret`, respectively, when `pm` is a pointer to member function with cv-qualifier `cv` and taking one argument of type `T1`, where `Ret` is `pm`'s return type.
- <sup>12</sup> The following member names are defined in addition to names specified in Clause 23:

```
namespace std {
    template <class Key, class T, class Compare, class Allocator>
    class map<Key, T, Compare, Allocator>::value_compare {
    public:
        typedef bool result_type;
        typedef value_type first_argument_type;
        typedef value_type second_argument_type;
    };

    template <class Key, class T, class Compare, class Allocator>
    class multimap<Key, T, Compare, Allocator>::value_compare {
    public:
        typedef bool result_type;
        typedef value_type first_argument_type;
        typedef value_type second_argument_type;
    };
}
```

### D.7.3 Negators

[depr.negators]

- <sup>1</sup> The header `<functional>` has the following additional declarations:

```
namespace std {
    template <class Predicate> class unary_negate;
    template <class Predicate>
        constexpr unary_negate<Predicate> not1(const Predicate&);
    template <class Predicate> class binary_negate;
    template <class Predicate>
        constexpr binary_negate<Predicate> not2(const Predicate&);
}
```

- <sup>2</sup> Negators `not1` and `not2` take a unary and a binary predicate, respectively, and return their logical negations (5.3.1).

```
template <class Predicate>
class unary_negate {
public:
    constexpr explicit unary_negate(const Predicate& pred);
    constexpr bool operator()(const typename Predicate::argument_type& x) const;
    typedef typename Predicate::argument_type argument_type;
    typedef bool result_type;
};
```

```
constexpr bool operator()(const typename Predicate::argument_type& x) const;
```

```

3      Returns: !pred(x).

template <class Predicate>
    constexpr unary_negate<Predicate> not1(const Predicate& pred);

4      Returns: unary_negate<Predicate>(pred).

template <class Predicate>
class binary_negate {
public:
    constexpr explicit binary_negate(const Predicate& pred);
    constexpr bool operator()(const typename Predicate::first_argument_type& x,
                               const typename Predicate::second_argument_type& y) const;
    typedef typename Predicate::first_argument_type first_argument_type;
    typedef typename Predicate::second_argument_type second_argument_type;
    typedef bool result_type;
};

constexpr bool operator()(const typename Predicate::first_argument_type& x,
                           const typename Predicate::second_argument_type& y) const;

5      Returns: !pred(x,y).

template <class Predicate>
    constexpr binary_negate<Predicate> not2(const Predicate& pred);

6      Returns: binary_negate<Predicate>(pred).

```

# Annex E (normative)

## Universal character names for identifier characters [charname]

### E.1 Ranges of characters allowed [charname.allowed]

00A8, 00AA, 00AD, 00AF, 00B2-00B5, 00B7-00BA, 00BC-00BE, 00C0-00D6, 00D8-00F6, 00F8-00FF

0100-167F, 1681-180D, 180F-1FFF

200B-200D, 202A-202E, 203F-2040, 2054, 2060-206F

2070-218F, 2460-24FF, 2776-2793, 2C00-2DFF, 2E80-2FFF

3004-3007, 3021-302F, 3031-303F

3040-D7FF

F900-FD3D, FD40-FDCF, FDF0-FE44, FE47-FFFF

10000-1FFFFD, 20000-2FFFFD, 30000-3FFFFD, 40000-4FFFFD, 50000-5FFFFD,  
60000-6FFFFD, 70000-7FFFFD, 80000-8FFFFD, 90000-9FFFFD, A0000-AFFFFD,  
B0000-BFFFFD, C0000-CFFFFD, D0000-DFFFFD, E0000-EFFFFD

### E.2 Ranges of characters disallowed initially [charname.disallowed]

0300-036F, 1DC0-1DFF, 20D0-20FF, FE20-FE2F

# Annex F (informative)

## Cross references

[xref]

This annex lists each section label and the corresponding section number, in alphabetical order by label. All of the section labels are the same as in the 2003 standard, except:

- labels that begin with `lib.` in the 2003 standard have had the `lib.` removed so that they do not all appear in the same part of this list. For example, in the 2003 standard, the non-modifying sequence algorithms were found in a section with the label `[lib.alg.nonmodifying]`. The label for that section is now `[alg.nonmodifying]`.
- the label for Annex B has been changed from `[limits]` to `[implimits]`. The label `[limits]` refers to section 18.3.2.

# Index of grammar productions

The first page number for each entry is the page in the general text where the grammar production is defined. The second page number is the corresponding page in the Grammar summary (Annex A).

- abstract-declarator*, 196, 1357
- abstract-pack-declarator*, 196, 1357

# Index of implementation-defined behavior

The entries in this section are rough descriptions; exact specifications are at the indicated page in the general text.

`#pragma`, 441

additional formats for `time_get::do_get_date`, 785

additional supported forms of preprocessing directive, 432

alignment, 79

alignment additional values, 79

alignment of bit-fields within a class object, 244

allocation of bit-fields within a class object, 244

argument values to construct `basic_ios::failure`, 1112

assignability of placeholder objects, 629

behavior of attribute scoped token, 189

behavior of `istream` classes when `traits::pos_type` is not `streampos` or when `traits::off_type` is not `streamoff`, 1094

behavior of non-standard attributes, 189

bits in a byte, 6

choice of larger or smaller value of floating literal, 27

concatenation of some types of string literals, 29

conversions between pointers and integers, 113

converting characters from source character set to execution character set, 17

converting function pointer to object pointer and vice versa, 113

default number of buckets in `unordered_map`, 885

default number of buckets in `unordered_multimap`, 890

default number of buckets in `unordered_multiset`, 898

default number of buckets in `unordered_set`, 894

defining `main` in freestanding environment, 61

definition and meaning of `__STDC__`, 442

definition and meaning of `__STDC_VERSION__`, 442

derived type for `typeid`, 110

diagnostic message, 2

dynamic initialization of static objects before `main`, 63

dynamic initialization of thread-local objects before entry, 63

effect of calling `basic_filebuf::setbuf` with non-zero arguments, 1169

effect of calling `basic_filebuf::sync` when a get area exists, 1170

effect of calling `basic_streambuf::setbuf` with non-zero arguments, 1158

effect of calling `ios_base::sync_with_stdio` after any input or output operation on standard streams, 1106

effect on C locale of calling `locale::global`, 754

encoding of universal character name not in execution character set, 26

`error_category` for errors originating outside the operating system, 473

exception type when `shared_ptr` constructor fails, 593

exceptions thrown by standard library functions that do not have an exception specification, 472

execution character-set and execution wide-character set, 18

exit status, 486

extended signed integer types, 74

formatted character sequence generated by `time_put::do_put` in C locale, 787

headers for freestanding implementation, 455

interactive device, 8

linkage of `main`, 61

linkage of names from Standard C library, 456

locale names, 752

manner of search for included source file, 434

mapping from name to catalog when calling `messages::do_open`, 794

mapping header name to header or external source file, 20

- mapping physical source file characters to basic source character set, [16](#)
- mapping to message when calling `messages::do_get`, [795](#)
- meaning of *dot-dot* in *root-directory*, [1188](#)
- meaning of `asm` declaration, [185](#)
- meaning of attribute declaration, [150](#)
- negative value of character literal in preprocessor, [434](#)
- nesting limit for `#include` directives, [435](#)
- number of threads in a program under a freestanding implementation, [11](#)
- numeric values of character literals in `#if` directives, [433](#)
- operating system on which implementation depends, [1177](#)
- parameters to `main`, [61](#)
- passing argument of class type through ellipsis, [106](#)
- physical source file characters, [16](#)
- presence and meaning of `native_handle_type` and `native_handle`, [1291](#)
- rank of extended signed integer type, [87](#)
- representation of `char`, [74](#)
- required libraries for freestanding implementation, [5](#)
- result of `exception::what`, [497](#)
- result of inexact floating-point conversion, [85](#)
- result of right shift of negative value, [128](#)
- return value of `bad_alloc::what`, [492](#)
- return value of `bad_array_new_length::what`, [492](#)
- return value of `bad_cast::what`, [495](#)
- return value of `bad_exception::what`, [497](#)
- return value of `bad_optional_access::what`, [550](#)
- return value of `bad_typeid::what`, [495](#)
- return value of `char_traits<char16_t>::eof`, [697](#)
- return value of `char_traits<char32_t>::eof`, [698](#)
- return value of `exception_list::what`, [500](#)
- return value of `type_info::name()`, [494](#)
- search locations for `"` header, [435](#)
- search locations for `<>` header, [434](#)
- semantics of linkage specification on templates, [338](#)
- semantics of linkage specifiers, [185](#)
- semantics of non-standard escape sequences, [26](#)
- sequence of places searched for a header, [434](#)
- signedness of `char`, [74](#)
- `sizeof` applied to fundamental types other than `char`, `signed char`, and `unsigned char`, [117](#)
- stack unwinding before call to `std::terminate()`, [423](#), [429](#)
- start-up and termination in freestanding environment, [61](#)
- string resulting from `__func__`, [211](#)
- string returned by `what()` for `bad_weak_ptr`, [590](#), [630](#)
- support for extended alignment, [663](#)
- support for over-aligned types, [117](#), [574](#), [576](#)
- supported multibyte character encoding rules, [696](#), [699](#)
- text of `__DATE__` when date of translation is not available, [442](#)
- text of `__TIME__` when time of translation is not available, [442](#)
- type of `ptrdiff_t`, [127](#), [475](#)
- type of `regex_constants::error_type`, [1239](#)
- type of `size_t`, [475](#)
- type of `streamoff`, [696](#)
- type of `streampos`, [696](#)
- type of `u16streampos`, [697](#)
- type of `u32streampos`, [698](#)
- type of `wstreampos`, [698](#)
- type of `array::const_iterator`, [832](#)
- type of `array::iterator`, [832](#)
- type of `basic_string_view::const_iterator`, [733](#)
- type of filesystem trivial clock, [1184](#)
- underlying type for enumeration, [170](#)
- use of non-POF function as signal handler, [502](#)
- value of `ctype<char>::table_size`, [764](#)
- value of bit-field that cannot represent assigned value, [133](#)
- incremented value, [108](#)
- initializer, [217](#)
- value of character literal outside range of corresponding type, [26](#)
- value of multicharacter literal, [25](#)
- value of result of inexact integer to floating-point conversion, [85](#)
- value of result of unsigned to signed conversion, [84](#)
- value of wide-character literal containing multiple characters, [26](#)
- value of wide-character literal with single c-char that is not in execution wide-character set, [26](#)

value representation of floating-point types, [75](#)  
value representation of pointer types, [76](#)  
values of a trivially copyable type, [72](#)  
values of various `ATOMIC_..._LOCK_FREE` macros,  
[1279](#)

whether `get_pointer_safety` returns `pointer_-  
safety::relaxed` or `pointer_safety::preferred`  
if the implementation has relaxed pointer  
safety, [569](#)

whether `time_get::do_get_year` accepts two-digit  
year numbers, [785](#)

whether an implementation has relaxed or strict  
pointer safety, [68](#)

whether locale object is global or per-thread, [749](#)

whether sequence pointers are copied by `basic_-  
filebuf` move constructor, [1165](#)

whether sequence pointers are copied by `basic_-  
stringbuf` move constructor, [1154](#)

whether source of translation units must be avail-  
able to locate template definitions, [17](#)

whether stack is unwound before calling `std::terminate()`  
when a `noexcept` specification is violated,  
[429](#)

whether values are rounded or truncated to the re-  
quired precision when converting between  
`time_t` values and `time_point` objects,  
[683](#)

which functions in Standard C++ library may be  
recursively reentered, [471](#)
